NEW SERIES

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign); single copy price is $3.00.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF I. URBANA Illinois

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

THE EFFECT OF CLIMATE ON DRAINAGE DENSITY AND STREAMFLOW,
US Geological Survey, Water Resources Div., Washington, D. C.
Charles W. Carlston.
Bull of the Int Ass of Sci Hydrol, Vol 11, No 3, pp 62-69, 1966. 8 p, 1 fig, 2 tab.

Descriptors: *Climatic zones, *Drainage density, *Streamflow, Recharge, Precipitation intensity, Runoff, Evapotranspiration, Base flow, Groundwater recharge, Temperature, Arid climates, *Storm runoff, *Rainfall-runoff relationships, Semiarid climates, Arid climates, Alluvial channels, Floods, Petrography, Flow rates.

Recharge is dependent upon the amount and distribution of precipitation, less the amount of loss in direct overland runoff and evapotranspiration. Examination of the relation of drainage density to base flow in the 15 basins studied gave evidence that base flow was affected by precipitation or recharge (a climatic variable), while varying inveresly with drainage density. Annual precipitation decreased to negligible amounts in passing through the sequence of increasing aridity in Steppe and Desert climates. Drainage density was a function of flood runoff intensity whether the magnitude of runoff intensity was due to precipitation intensity or terrene transmissibility. In semi arid and desert climates of the western and southwestern United States, recharge to the water table occurred only during exceptionally wet and cool winters or along flooded alluvial ephemeral watercourses at times of exceptional storms. These regions were characterized by extremely great variations in flood runoff and drainage density. There were great differences between the barren, angular, fine textured mountain ranges and the broad, smooth and aggrading depositional bolson floors of the intermountain basins. (Blecker-Ariz)

TIME SERIES ANALYSIS,
U. S. Geological Survey, Arlington, Virginia.
N. C. Matalas.
Water Resources Research, Vol 3, No 3, pp 817-829, Third Quarter 1967. 13 p, 28 ref.

Descriptors: *Time series analysis.
Identifiers: *Serial correlation, *Generating process, Hydrologic events, Stationary time series, Nonstationary time series.

A characteristic feature of hydrologic events is that they are not independently distributed in time. The degree of linear dependence between events that are K time units apart is measured by the serial correlation coefficient. This correlation, which tends to decrease with an increase in K, is attributed to storage processes in the atmosphere or within the drainage basin. The correlation measures the degree of redundancy of information yielded by each hydrologic event. This redundancy implies that statistical parameters computed from a sequence of events are less reliable than is indicated by the sequence length. Hydrologic sequences are formulated in terms of generating models to account for serial dependence between events, to allow prediction of events at future time points, and to assess the effect of serial dependence on hydrologic studies. PROGRAM FOR ESTIMATING RUNOFF FROM INDIANA WATERSHEDS, PART I: LINEAR SYSTEM ANALYSIS IN SURFACE HYDROLOGY AND ITS APPLICATION TO INDIANA WATERSHEDS,
Purdue Univ, Lafayette, Indiana.
D. Blank, and J. W. Delleur.
Technical Report No. 4 Purdue University Water Resources Research Center. August 1968, 179 pages, 10 tab, 49 fig, and 78 ref.

Descriptors: *System Analysis, Input-output analysis, Hydrograph analysis, *Rainfall-runoff relationships, Watersheds, Base runoff, Rainfall excess, Storm runoff, Harmonic analysis, Frequency analysis, Hydrologic models, Synthetic hydrology, Analog models.
Identifiers: Linear system, Impulsive response, Convolution integral, Laplace transform, Fourier transform, Input matrix, Output vector, Kernel vector.

Rainfall-runoff relations were expressed by the convolution integral. The kernel function was evaluated by Fourier transform, Laplace-Gamma and Direct methods. Three analytical examples (known kernels) were analyzed. Data of 1059 storms from 55 Indiana watersheds ranging from 3 to 296 sq. mi. were assembled. The results indicated that for a third of the storms oscillatory kernels resulted. Oscillations were not necessarily due to nonlinearities but can arise from random errors in the data. Regardless of the shape of the kernel, output reproduction was accurate. Kernels from a watershed varied from storm to storm. These differences can be described in terms of time lag and maximum ordinate, and are indicative of system nonlinearity. Grouping of dimensionless kernels according to the above mentioned parameters is the basis for a suggested method of prediction, using trend relationships between maximum ordinate and base time, and between the former and time lag. Harmonic analysis of stage recorder response was presented, with the conclusion that for all natural storms no significant signal deformation is expected. Design and construction of an electronic analog simulator for rainfall-runoff studies were described. Preliminary investigation indicated that the analog is linear and can be used to estimate response to natural storms. (Blank-Purdue)
W69-00210

ANALYSIS OF HYDROLOGIC SYSTEMS,
Virginia Polytechnic Institute, Blacksburg, Water Resource Center.
T. T. Chiang, and J. M. Wiggert.
OWRR Project No. A-013-VA, Water Resources Research Center, Bull. 12, May 1968. 5 p.

Descriptors: *Hydrology, *Runoff, *Floods, *Similarities, Systems analysis.

The techniques of process dynamics analysis or frequency response analysis were applied to the response to precipitation excess of watersheds. Rectangular, impervious model basins were tested for response characteristics and the input-output (rainfall-runoff) data were manipulated to provide the standard parameters of the transfer functions. These parameters were then used in an analog simulator for a digital computer to test the transfer function. The method of analysis was also applied to natural hydrologic systems, using data from the Detroit, Michigan area, after reducing the data to that of precipitation excess and surface runoff. The conclusion of the analysis is that the method reproduces flows quite well. A nonlinear, second-order equation was found to represent the runoff of the model basins. A linear, second-order equation, in which the damping coefficient is very nearly unity (the critically damped case), was found to be a fairly good description of the flows of natural basins. WATER POTENTIAL STUDIES OF LUNI BASIN,
Central Arid Zone Research Inst., Johdpur, Rajasthan, India.
V. V. Dhruvanarayana.
Ann of Arid Zone, Vol 4, No 2, pp 99-109, Sept 1966. 11 p, 2 tab.

Descriptors: *Groundwater, *Surface waters, Water resources, Rainfall disposition, Temperature, Equations, *Water balance, Climatic data, Water utilization, Reservoir storage, Rainfall-runoff relationships, *Numerical analysis.
Identifiers: India, *Water potential.

Water potential figures obtained by different methods were compared to get reliable figures of surface and groundwater potentials of the Luni Basin. Figures of mean and maximum daily rainfall and mean and maximum temperatures up to 1950 were utilized. The methods used included Thornwaite's, Khosla's, Blaney's and Strange's. Approximately equal values of total water potential were obtained with the Thornwaite and Khosla methods and the mean value of the two was considered the probable water potential. (Affleck-Ariz)

2B. Precipitation

ANNOTATED BIBLIOGRAPHY OF ESSA PUBLICATIONS OF HYDROMETEOROLOGICAL INTEREST,
Weather Bureau, ESSA, Office of Hydrology.
J. L. H. Paulhus.
ESSA Technical Memorandum WBTM HYDRO-6, November 1967, Second Edition, 27 p.

Descriptors: *Bibliographies, *Hydrology, *Meteorology, Climatology, Clouds, Dew point, Droughts, Evaporation, Floods, Hydrologic cycle, Precipitation (Atmospheric), Radar, Radiation, River forecasting, Runoff, Snow, Storms, Streamflow, Temperature, Water management (Applied), Winds.
Identifiers: *Hydrometeorology, Relative humidity, Water supply forecasts.

Lists 105 ESSA publications pertinent to the joint fields of hydrology and meteorology. This bibliography is especially intended to serve the engineer by bringing to his attention the publications of hydrometeorological material that he often requires. General subjects include: Climatological Observations and Data/Clouds, Liquid Water Content in Storms/Dewpoints, Maximum persisting/Drought/Evaporation /Floods/Hydrologic Cycle/Networks, Hydrologic/Precipitable Water/Precipitation, computed/Precipitation, Depth-Area-Duration Analysis/Precipitation, Excessive and Maximum Observed/Precipitation, Mean and Normal/Precipitation Measurements/Precipitation, Probable Maximum/Radar (Hydrologic Uses)/Radiation, Solar and Sky/Rainfall Frequency/Relative Humidity/ River and Flood Forecasting/River Stages/Runoff/ Snow/Station History/ Storms (thunderstorms, tropical storms, hurricanes)/Storm Surges/Streamflow Frequency Analyses/Temperature/Wat Management/Water Supply Forecasts/Wind. TIME ANALYSIS OF RAINFALL ON AN URBAN CATCHMENT,
Auckland Univ., New Zealand.
V. J. Bidwell.
J of Hydrol (New Zealand), Vol 6, No 2, pp 74-79, 1967. 6 p, 3 fig.

Descriptors: *Rainfall, *Rainfall intensity, Rain gages, Runoff, Mass curves, *Probability, *Correlation analysis, Rainfall disposition.

LIBRARY U. OF I. URBANA CHAMPAIGN

For urban catchments, time of concentration, runoff, and other time parameters involved is relatively short and thus rainfall increment must be short - in this analysis it was 10 minutes. A year of 10-minute rainfall values was extracted from autographic records for Albert Park, Auckland, New Zealand. The record was analyzed in order to obtain the critical time lag which was a measure of rainfall persistence. Probability of occurrence of any rainfall event was assumed to be independent of any other event. The data was punched on IBM cards for computer use. Rank-correlation coefficient were used as a test for rainfall persistence. The length of record used was not of sufficient duration to give conclusive evidence of storm lengths or any seasonal variations. Large differences occurred in sets of data analyzed in the one-year record. Whether differences were due to seasonal changes or other factors was not readily apparent. It was intended that the analysis serve as an indication of the application of the techniques to rainfall records. Techniques used in the study could be applied to arid climates where rainfall persistence and probability of occurrence are important. (Blecker-Ariz)
W69-00156

RAINFALL GRADIENTS IN WARM SEASON RAINFALL,
Illinois State Water Survey, Urbana.
F. A. Huff.
J of Applied Meteorol, Vol 6, No 2, pp 435-437, April 1967. 3 p, 2 fig.

Descriptors: Rainfall, *Rainfall disposition, Storms, Meteorology, *Rain gages, Equations, Seasonal, *Meteorological data, Variability.

Little quantitative information has been published on distribution of rainfall gradients in various types of storms. The purpose of the study was to provide quantitative information on rainfall gradients in warm season storms in the Midwest. Records from two dense networks of recording raingages in central Illinois provided data for the study. Two equations provided the means for obtaining quantitative estimates of rainfall in unstable, shower-type precipitation of spring to fall. The derived relationships were applicable to total storm rainfall for storm durations of 24 hours or less. Results were considered a reasonable approximation of daily rainfall relations since the storm definition resulted in most storm days having a single storm period. (Blecker-Ariz)
W69-00166

METEOROLOGY OF MAJOR STORMS IN WESTERN COLORADO AND EASTERN UTAH,
Weather Bureau, ESSA, Office of Hydrology.
R. L. Weaver.
ESSA Technical Memorandum WBTM HYDRO 7, January 1968, 75. 40 fig, 14 tab, 12 ref.

Descriptors: Advection, Air circulation, Air masses, Climatology, Hydrology marine air masses, Meteorology, Moisture, Mountains, Orography, Precipitation (Atmospheric), Rainfall disposition, Rainfall intensity, Storms, Storm structure, Synoptic analysis temperature, Topography, Weather patterns, Winds.
Identifiers: Western Colorado, Eastern Utah, 500-mb patterns.

Meteorology of Major Storms in Western Colorado and Eastern Utah. The 42 most intense general storms in eastern Utah and western Colorado since 1899 are studied in relation to the observed or estimated broadscale upper air circulation patterns and sources of moisture. The report summarizes individual analyses of the storms. Storms are typed by reference to the behavior of the 500-mb patterns. The role of upper Lows in transporting moisture is emphasized. Indices are developed which evaluate storm moisture, temperature and influence of topography. The relative importance to the precipitation sequence of peak moisture versus proximity of upper Lows or troughs is compared. Moisture source regions are related to storm type and season. Local topographic effects are summarized by upper wind direction. (Strahl-ESSA)

2D. Evaporation and Transpiration

USE OF ATMOMETERS IN ESTIMATING EVAPOTRANSPIRATION,
California State Department of Water Resources, Sacramento.
John W. Shannon.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR3, Pap 6120, pp 309-320, Sept 1968. 3 fig, 4 tab, 6 ref.

Descriptors: *Evapotranspiration, *Instrumentation, *Atmometers, *Evaporation pans, Calibration, Vegetation effects, Agricultural engineering.
Identifiers: *Crop coefficients (Evapotranspiration), Climatological data.

Studies conducted by the California Dept of Water Resources during the past 10 yr show that Livingston black and white spherical atmometers provide a practical means of estimating monthly and seasonal evapotranspiration. The difference of evaporation between the black and white atmometers is affected primarily by shortwave energy, whereas evaporation from either the black or white atmometer provides an index of the total amount of energy available for evapotranspiration. Various studies have been made, the results of which indicate that the type of background such as bare ground, dry range, or irrigated pasture has little effect upon the difference in evaporation between the black and white atmometers. Height above the ground or crop likewise has little or no effect upon the difference of evaporation. Monthly crop coefficients have been developed for some of the principal crops in the California Central Valley, which provide evapotranspiration estimates consistently as good or better as can be obtained using coefficients developed from United States Weather Bureau Class A evaporation pan data. (Knapp-USGS)
W69-00105

THE LIMITATION OF TEMPERATURE BY EVAPORATION IN HOT CLIMATES,
Australia Commonwealth Sci. Indus. Thech. Org., Aspendale, Victoria.
C. H. B. Priestley.
Agr Meteorol, Vol 3, No 3/4, pp 241-246, May 1966. 6 p, 3 tab.

Descriptors: Temperature, Evaporation, Arid climates, *Climatic data, *Plant growth, Environmental effects, Soil moisture, Heat transfer, *Heat balance, Leaves, *Air temperature.
Identifiers: *Hot regions.

Many factors affecting plant growth and well-being are sensitive to the temperature of the plant and its environment, particularly at high temperatures. A review of data was done to see what are the general principles which govern the maximum temperatures which can be obtained in the environment of a growing plant, plentifully supplied with moisture. A resume of heat balance was given. A climatic evaluation was done for 1850 stations distributed over the land surfaces of the world. Data collected by Linacre have indicated a reversal of heat transfer between leaf and air in the vicinity of 33 deg C for thin-leaved plants exposed to bright sunshine. An alternative view advanced in the paper and supported by a climatic study was that the phenomenon was quite general and that 33 deg C represents the maximum temperature attained by the air over any extensive freely evaporating surface which is naturally exposed. (Blecker-Ariz)
W69-00146

ESTIMATES OF POTENTIAL EVAPORATION USING ALTERNATIVE DATA IN PENMAN'S FORMULA,
Commonwealth Sci. Indus Research Org., Canberra, Australia.
E. A. Fitzpatrick, and W. R. Stern.
Agr Meteorol, Vol 3, pp 225-239, 1966. 16 p, 3 fig 2 tab, 23 ref.

Descriptors: *Evaporation, *Radiation, Vapor pressure, Air temperature, Wind velocity, Seasonal, Instrumentation, Equations, Data collections.
Identifiers: *Penman's formula, Australia.

At Kununurra, Western Australia which has an environment with a wide seasonal range of radiation and vapor-pressure deficit, the energy and aerodynamic components of Penman's evaporation formula were calculated daily for a year. Reference values for the aerodynamic component were calculated from wet- and dry-bulb temperatures and windspeed using a relationship defined by Penman. Total radiation and relative duration of sunshine were found to be effective alternative sources of data for the energy component. Daily Piche and tank evaporimeter data were found to be satisfactory alternatives to the aerodynamic component. The minimal instrumentation needed to determine potential evaporation was a net radiometer, Piche evaporimeter and maximum and minimum thermometers provided a suitable relation between the Piche and aerodynamic component existed. The use of inappropriate constants in the Penman formula was probably a greater source of error when determining potential evaporation than the deficiencies inherent in a particular type of instrument, e g, a sunshine recorder. (Blecker-Ariz)
W69-00161

HYDROLOGIC PROPERTIES OF SEVERAL UPLAND FOREST HUMUS TYPES IN THE LAKE STATES REGION,
Michigan State Univ., East Lansing, Dept of Forestry.
Wade L. Nutter.
OWRR Report A-017-Mich., Ph.D. Dissertation, 147 p, 27 fig, 7 tab, 42 ref.

Descriptors: Humus, *Forest soils, *Evaporation, Unsaturated flow, *Soil water, Mulching, *Infiltration, Temperature, Humidity, Radiation, Diffusivity, Percolation, Soil water movement, Soil physics, *Hydrologic properties, Water loss.
Identifiers: Lake States, Humus-soil complex, Forest hydrology.

Ten sites were sampled that included a variety of soil and forest conditions and humus varients of mull, duff-mull, and mor. Rates of evaporation for undisturbed cores of the humus-soil complex, 16.5-cm diameter and 25.4-cm deep, were determined in controlled environment chambers by weight loss and water redistribution by gamma radiation. The humus types were separated by their hydrologic properties into four groups, each independent of inter-site mineral soil variation. Evaporation during a 50-day period was at a continuous falling rate lower than the water transmitting properties of the humus-soil complex and the mors lost a greater fraction of the initial water content than either the mulls or duff-mulls. Water flowed against the water content gradient during evaporation in response to an assumed matric suction gradient. The F horizon ceased to lose water between 16 and 30 days but the H horizon continued to lose water at a decreasing rate for the entire period of evaporation. During simulated rainfall the F and H horizons resisted wetting and water advanced as a wetting front in the mineral soil maintaining the nonuniform shape of the initial water content profile. PAN EVAPORATION AND EVAPOTRANSPIRATION FROM CLIMATIC DATA,
Utah State Univ, Logan.
Jerald E. Christiansen.

J Irrig and Drainage Div (ASCE), Vol 94, No IR 2, Proc Paper 5988, pp 243-265, June 1968. 23 p, 13 tab.

Descriptors: *Evaporation pans, *Evapotranspiration, *Climatic data, *Mathematical models, Equations, Data collections, *Analytical techniques, Temperature, Solar radiation, Wind velocity, Humidity, Elevation.

A formula was developed at Utah State University for estimating pan evaporation from extraterrestrial radiation and climatic data. This formula utilizes climatic data of the type most readily available. Tables are presented to simplify the application of the formula where electronic computers are not used. Three formulas for estimating evapotranspiration for several agricultural crops using as the principal parameters either extraterrestrial radiation, pan evaporation or measured incident radiation, together with climatic data were also presented. The planning and design of irrigation systems in arid regions requires, at the outset, an estimate of water requirements which this formula can help to supply. (Affleck-Ariz)
W69-00362

EVAPORATIVE WATER LOSSES OF SOME SMALL AUSTRIALIAN LIZARDS,
Michigan Univ, Ann Arbor.
Willian R. Dawson, Vaughan H. Shoemaker, and Paul Licht.
Univ. of Western Australia, Nedlands Affiliate Inst.
Ecol, Vol 47, No 4, pp 589-594, 1966. 1 fig, 2 tab.

Descriptors: *Evaporation, *Water loss, Animal physiology, Arid climates, *Metabolism, Weight, Temperature, Ecology, Environmental effects, Reptiles.
Identifiers: Australia, *Lizards.

Three Australian lizards: Amphibolurus ornatus (agamidae), Gehyra variegata (Gekkonidae), and Sphenomorphus labillardiere (Scincidae) were compared with respect to water loss in a dry atmosphere. At 20 deg C the rates of total water loss for the unrestrained A ornatus, G variegata and S labillardieri averaged 1.9 g (100 g day) -1, 3.0 g (100 g day) -1 and 6.8 g (100 g day) -1 respectively. These figures represented evaporative water loss primarily and not metabolic activity. At 20 deg C and 30 deg C the water loss which was primarily of pulmonary origin of A ornatus averaged lower than that of the other two species. Cutaneous loss at 20 deg C comprised 70% of evaporative loss by A ornatus and G variegata and 41% of S labillardieri. At 30 deg C these percentages were lower. (Affleck-Ariz)

EVAPORATION OF WATER FROM SOILS AS INFLUENCED BY DRYING WITH WIND OR RADIATION,
U. S. Dept. of Agriculture, Fort Collins, Colorado.
R. J. Hanks, H. R. Gardner, and M. L. Fairbourn.
Soil Sci Soc of Amer, Vol 31, No 5, pp 593-598, Sept-Oct 1967. 6 p, 12 fig, 3 tab.

Descriptors: *Evaporation, *Winds, *Radiation, Air temperature, Soil temperature, Vertical migration, *Soil moisture, Arid lands, Thermocline, Drying, Soil profiles, Soil water movement, *Moisture content.

Evaporation of water directly from the soil accounts for loss of a large part of the precipitation received in arid parts of the world. A study was done to determine relative importance of temperature gradients in evaporation of water from soil. Water was evaporated from soils using wind and radiative drying that would produce different temperature gradients of various magnitudes and direction. When soils were compared for periods, absolute magnitude of the slope of the water content profile was greater at the bottom of the column for silt loam than for loamy sand or sand. The reverse was true near the soil surface. Temperature profiles for the three soils were similar and data from radiated columns showed an increase of temperature with depth from 0.5 to about 6 cm at 1 day and then a decrease with depth below 6 cm. Evaporation for the second day until the end of the run was 1.22, 0.91 and 1.41 times higher for wind than for radiation treatment of silt loam, loamy sand and sand soils respectively. (Blecker-Ariz)

THE EFFECT OF SLOPE, ASPECT AND ALBEDO ON POTENTIAL EVAPOTRANSPIRATION FROM HILLSLOPES AND CATCHMENTS,
New Zealand Dept. of Scientific and Industrial Research, Soils Bureau.
R. J. Jackson.
J of Hydrol (New Zealand), Vol 6, No 2, pp 60-69, 1967. 10 p, 4 fig, 2 tab.

Descriptors: *Evapotranspiration, Energy gradient, Radiation, *Solar radiation, *Slopes, Evaporation, *Albedo, Equations, Stream flow, Water balance.
Identifiers: Catchments, Penman's formula, Aspect, *Energy balance.

Use of a radiant energy balance appropriate to slope, aspect and albedo of a hillslope or catchment, in estimation of potential evapotranspiration of Penman's method, was illustrated for horizontal surfaces and slopes of 10, 20, 30 and 40 degrees facing north, south, east or west and having albedos of 0.1 and 0.25. The energy-balance approach to estimation of evaporation, which is based on the principle of the conservation of energy, was discussed, using equations. Included also were solar radiation on slopes, net radiation and potential evapotranspiration. For a region with average annual rainfall of 50 to 55 inches, the data implied a considerable variation in potential annual surplus available for stream flow according to characteristics of a hill slope or a catchment area. For any particular combination of slope and aspect there was a 20% decrease in potential evapotranspiration as a result of change in albedo which occurred to a greater extent in the summer months. Slope and aspect had their greatest influence on potential evaporation at the equinox. Methods described in the study could be used to measure evapotranspiration from hillslopes and catchments in arid parts of the world. (Blecker-Ariz)

2E. Streamflow and Runoff

NEW ASPECTS OF RIVER RUNOFF CALCULATIONS,
Pub for U. S. Department of Commerce and National Science Foundation, Washington, D. C., by Israel Prog for Scientific Transl, Jerusalem.
A. G. Trestman.
Book, Transl from Russian, OTS61-11465, U. S. Dep of Commerce, 163 p, 1964. 14 tab, 54 fig, 92 ref, 3 append.

Descriptors: *Discharge measurement, *Stage-discharge relations, *Stream gages, *Gaging stations, *Hydrographs, Streams, Flowmeters, Flow rates, Runoff, Hydrology, Hydrologic data, Methodology.
Identifiers: *USSR, Hydrometeorological service, Discharge curves.

The methods of runoff measurement and computation in use in the USSR are given in a 163-page manual covering the full range of the problems of hydrometry. Novel proposals are made concerning methodology of analyzing hydrometric data. A detailed classification of discharge curves according to their degree of instability is supported by numerous practical examples to facilitate analysis of runoff. The general categories covered are: present hydrometric methods and their short-comings; classification of discharge curves by their degree of stability; relationship between runoff and stability of discharge curves as a basis for runoff-computation methods; and the task of the hydrometerological service in organizing and supervising hydrometric work. WATER DISCHARGE DETERMINATIONS FOR THE TIDAL REACH OF THE WILLAMETTE RIVER FROM ROSS ISLAND BRIDGE TO MILE 10.3, PORTLAND, OREGON,
U. S. Geological Survey, Water Resources Division, Washington, D. C.
George R. Dempster, Jr., and Gale A. Lutz.
U S Geol Surv Water-Supply Pap 1586-H, 1968. 32 p, 10 fig, 2 tab, 6 ref.

Descriptors: *Discharge (Water), *Discharge measurement, *Stage-discharge relations, *Unsteady flow, *Tidal waters, Digital computers, Mathematical models, Hydrographs, Routing, Oregon.
Identifiers: Slope-discharge relations, Willamette River, Portland.

Existing limited information about the river flow at Portland is supplemented and the use of mathematical models for determining water discharge in a tidal portion of the Willamette River is evaluated. In addition to presenting flow parameters, the applicability of using mathematical models to determine the discharge for the Willamette River at Portland is demonstrated by comparing computed and observed discharges for short term records and by comparing daily computed and routed discharges for a partial water year. The routed discharges are based on summations of upland streamflows routed to Portland. Discharges computed by using the mathematical models compare satisfactorily with observed discharges, except during the period of backwater from the annual flood of the Columbia River. The flow resistance coefficients used in the models vary with discharge. Agreement of computed with routed daily mean discharges is fair; above 30,000 cfs, average differences between the two discharges are about 10% and below 30,000 cfs, computed daily discharges are consistently greater than routed discharges by as much as 25%. SOME RUNOFF CHARACTERISTICS OF BRITISH RIVERS,
Hull Univ., England, Department of Geography.
R. C. Ward.
J Hydrol, Vol 6, No 4, pp 358-372, Aug 1968. 15 p, 8 fig, 1 tab, 5 ref.

Descriptors: *Runoff, *Rivers, *Hydrographs, *Streamflow, Rainfall-runoff relationships, Spatial distribution.
Identifiers: Britain.

Runoff data available for British rivers are reviewed and general characteristics of seasonal and spatial variation of flow are outlined. Short periods of record are lacking generally, so 10 yr records are compared statistically with 25 yr records to determine their correspondence. Mean annual flows differ by no more than 10%, mean monthly extremes show only one case of greater

LIBRARY U. OF I. URBANA ILLINOIS

than 10% difference, and mean monthly minima show only a few large differences between 10 and 25 yr records. Of 37 rivers studied, 29 show a low water period in summer and a maximum in winter. The remaining 8 show a slight tendency to have a secondary high in summer. Maxima occur in Dec in the northwest of Britain, but as late as March in the southeast. Mean minima occur in June in the northwest and as late as Oct in the southeast. These trends are explained by greater evapotranspiration in the south and east and less infiltration in the northwest. Rainfall, as well as runoff intensity, generally decrease from northwest to southeast. (Knapp-USGS)

SOME THERMAL CHARACTERISTICS OF TWO RIVERS IN THE PENNINE AREA OF NORTHERN ENGLAND,
Durham Univ., U. K., Dept. of Geography.
K. Smith.
J Hydrol, Vol 6, No 4, pp 405-416, Aug 1968. 12 p, 6 fig, 4 tab, 18 ref.

Descriptors: *Water temperature, *Rivers, Weather data, Hydrological data, Climatology.
Identifiers: River thermal characteristics, England.

Water temperature for the Wear and Tees Rivers and climatic data in the Pennine region of Northern England are compiled and analyzed. In the period of record of 4 yr, the thermal regime is compared at upstream and downstream sites on each river. River temperature and climatic data are presented graphically and in tables. The range in air temperatures is several times that of the water temperatures and the diurnal water temperature peak is progressively delayed relative to peak air temperature with distance downstream. RECORDS OF NORTH-SIDE SPRINGS AND OTHER INFLOW TO SNAKE RIVER BETWEEN MILNER AND KING HILL, IDAHO, 1948-67,
U. S. Geological Survey.
C. A. Thomas.
Idaho Dep Reclam Water Inform Bull No 6, Aug 1968. 65 pp, 5 fig, 3 ref.

Descriptors: *Springs, *Inflow, *Discharge (Water), *Idaho, *Data collections, Hydrographs, Stream gages, Flow measurement, Discharge measurement.
Identifiers: Snake River, Idaho.

The average annual inflow of water to the Snake River, Idaho, between gaging stations at Milner and King Hill was determined to be 7,400 cfs during the water years 1910-1966. An estimated average of 5,900 cfs or 4.3 million acre-ft per yr issued from springs on the north bank and 1,500 cfs was from all south side sources. The spring flow is discharge from the Snake Plain aquifer which is recharged by seepage from streams flowing onto the Plain from the mountains to the north, seepage from Snake River and its tributaries, and infiltration of precipitation and irrigation water. All spring records collected from 1948 to 1967 are tabulated. A map shows locations of gaging stations and spring-measuring sites. Graphs show annual mean inflow, total spring flow, and the recharge index for the Snake River Plain. Hydrographs are drawn of spring flows, south bank inflow, total inflow, and recharge index below American Falls. (Knapp-USGS)

EVALUATION OF RUNOFF COEFFICIENTS FROM SMALL NATURAL DRAINAGE AREAS,
Kentucky Univ., Lexington.
Carlos Fix Miller.
Kentucky Univ, Water Resources Inst, Res Rep No 14, 1968. 112 pp, 25 fig, 14 tab, 36 ref.

Descriptors: *Rainfall-runoff relationships, *Flood forecasting, *Runoff coefficient, *Overland flow, *Small watersheds, Hydrograph analysis, Peak discharge, Infiltration, Rainfall intensity, Flood routing, Rainfall disposition, Time lag, Vegetation effects.
Identifiers: *Overland flow prediction.

Overland flow runoff coefficients are estimated from local watershed characteristics. The Stanford Watershed Model was used as a basis for developing a simplified empirical method for predicting flood peaks and frequencies for the design of small engineering structures such as highway bridges and culverts. The overland flow may be taken as some fraction of peak rainfall intensity. The coefficients of overland flow depend on the nature of the watershed surface, the probable soil moisture content, and the rainfall intensity. To predict the resultant streamflow, each overland flow hydrograph is routed downstream to a common point. The coefficient of resultant flow depends on areal distribution of overland flow, basin shape, drainage pattern, stream velocity, stream cross section, and tributary area. Equations and graphs are given to relate exposed surface index, percent impervious area, permeability, soil depth, and slope to coefficient of overland flow. Sources of information are soil surveys, topographic maps, and air photos. (Knapp-USGS)

INSTANTANEOUS UNIT HYDROGRAPH RESPONSE BY HARMONIC ANALYSIS,
Virginia Polytechnic Institute, Blacksburg, Water Resource Center.
J. M. Wiggert.
OWRR Project, Report No. A-014-VA, August, 1968. 5 p.

Descriptors: Harmonic analysis, *Instantaneous unit hydrograph, Surface runoff.

The method of harmonic analysis for the derivation of instantaneous unit hydrographs was studied with reference to its applicability to surface runoff prediction. It was noted that stability of harmonic coefficients was approached, as a minimum of twenty data points were available, though more were desirable. The need for a realistic separation of runoff and base flow was indicated. Most success at obtaining realistic instantaneous unit hydrographs was had when rainfall excess was confined to one or two measurement intervals. Very good correlations of predicted surface runoff were obtained with the observed surface runoff hydrographs when these instantaneous unit hydrographs were combined with more complex patterns of rainfall excess from storms of equal, overall duration. THE SOLUTION OF GYPSUM AND LIMESTONE BY UPWARD FLOWING WATER,
Nottingham Univ., Department of Geology, Great Britain.
R. J. Firman, and J. A. D. Dickson.
The Mercian Geologist, Vol 2, No 4, pp 401-408, Aug 1968. 8 p, 3 fig, 3 plate, 2 ref.

Descriptors: *Aquifers, *Gypsum, *Limestones, *Leakage, Groundwater.
Identifiers: *Leaky artesian aquifers, Evaporites, Nottinghamshire, Great Britain.

Examples are described of gypsum and limestone which have been dissolved by upward flowing water. It is suggested that such artesian and subartesian waters are more often agents of corrosion than is generally recognized. Gypsum nodules in the Newark Series of the Keuper Marl of Nottinghamshire commonly have solution holes on their bottom surfaces. Comparable holes are not found on the top surfaces of any nodules. Water commonly flows up out of the bottoms of gypsum quarries in which similar corrosion is seen on the undersurfaces of gypsum beds. Limestone quarries show the same features. In both examples the geologic structure consists of dipping strata containing alternating impermeable and soluble beds, which is a common occurrence with limestone and evaporites. Water moves upward out of the confined aquifer through solution openings in the soluble rocks. This is a common form of aquifer leakage in many artesian systems. (Knapp-USGS)

THE HYDROGEOLOGY OF AN INDUCED STREAMBED INFILTRATION AREA,
Connecticut University, Department of Geology and Geography, Storrs, Conn.
P. H. Rahn.
Ground Water, Vol 6, No 3, pp 21-32, May-June 1968. 12 p, 12 fig, 2 tab, 45 ref.

Descriptors: *Groundwater, *Induced infiltration, *Glacial drift, *Surface-groundwater relationships, Connecticut, Permeability, Pump testing, Streamflow, Observation wells, Hydrologic aspects, Hydrogeology.
Identifiers: *Induced recharge, *Streambed infiltration, Vertical permeability, Horizontal permeability, Eskers.

An evaluation is made of the hydrogeology and physical properties of an aquifer system in which induced infiltration is evident. Measurement of streamflow at 3 weirs on the Fenton River, Connecticut, shows that about 34% of the water withdrawn was induced streambed infiltration. The Connecticut University well field is in a sand and gravel ice-contact stratified drift aquifer which fills the valley 60-ft deep. Water level measurements in 30 observation wells show that cones of depression spread underneath the river and are influenced in shape by highly permeable, partly buried eskers. The water table is detached from the river in the area of influence of the wells because of the low vertical permeability of the streambed in comparison with the high horizontal permeability of the drift aquifer. The streambed cannot recharge the aquifers in the immediate area of pumping as fast as water is withdrawn. Time-drawdown pumping tests are not affected by the river. Thus, geology has a more important effect on aquifer yield than the pure hydrologic river-well system. Production is about 1 mgd. Quality is very good; no chlorination is needed. Data presented in topographic and surface geologic maps, water-table contour maps, tables, and sections. (Knapp-USGS)

UNSTEADY SEEPAGE FLOW BETWEEN FULLY-PENETRATING TRENCHES,
Wisconsin Univ., Milwaukee, Dept. of Mech., and Northwestern Univ., Evanston, Ill., Dept. of Civil Eng.
Gabor Karadi, Raymond J. Krizek, and Hameed Elnagger.
J Hydrol, Vol 6, No 4, pp 417-430, Aug 1968. 14 p, 9 fig, 3 ref.

Descriptors: *Unsteady flow, *Groundwater movement, *Drainage effects, *Ditches, Dupuit-Forcheimer theory, Digital computers.
Identifiers: Matrix computation methods.

Unsteady seepage flow between 2 fully penetrating trenches is analyzed for homogeneous isotropic porous media characteristics. The solution may be extended to a cross-anisotropic porous medium. The method uses matrix mathematics to solve a non-linearized equation derived from Dupuit-Forcheimer approximations and the replacement of partial differential equations with a system of ordinary differential difference equations. The method may easily be adopted to computers and handles complicated boundary and initial conditions as well as allowing step by step treatment of the non-linearity of the differential equation. The results calculated are in better agreement with experimental results than are results obtained by the use of linearized field equations. (Knapp-USGS)

PRELIMINARY REPORT ON THE WATER RESOURCES OF THE KAHUKU AREA, OAHU, HAWAII,
U. S. Geological Survey, Honolulu, Hawaii.
K. J. Takasaki, Santos Valenciano, and A. M. Ho.
Hawaii Dep of Land and Natur Resources, Div of Water and Land Dev, Circ C39, Nov 1966. 33 p, 16 fig, 11 ref.

Descriptors: *Water resources, *Groundwater, *Hawaii, Rainfall, Basalts, Irrigation water, Saline water intrusion, Runoff, Isohyets, Ephemeral streams, Hydrographs.
Identifiers: Kahuku area, Oahu, Hawaii, Dike water, Potential water sources.

Groundwater is the source of all the water used in the Kahuku area because the rainfall, which ranges from 30 in. on the coast to 300 in. in the mountains, infiltrates rapidly and very little of the aggregate precipitation of 273,000 acre-ft per yr runs off. Most streams are perennial in the high parts of the area and some are perennial in their middle reaches where they are fed by groundwater discharge. Most streams are ephemeral in their lower reaches. In a 2-3 mile wide zone along the crest of the mountains, groundwater is impounded by basaltic dikes. Water levels in dike impoundments range from 10-1,000 ft msl. The water moves parallel to the dikes as well as through and over them. In coastal areas, basal ground water levels are within a few ft of sea level. Numerous wells tap the basal groundwater to irrigate sugar cane. Total groundwater draft is 29 mgd. There is some salinity increase from sea water intrusion and return of irrigation water. (Knapp-USGS)
W69-00130

PRELIMINARY REPORT ON THE WATER RESOURCES OF THE KAU DISTRICT, HAWAII,
U. S. Geological Survey, Honolulu, Hawaii.
Dan A. Davis, and George Yamanaga.
Hawaii Dep of Land and Natur Resources, Div of Water and Land Dev, Circ C27, Oct 1966. 25 p, 7 fig, 5 ref.

Descriptors: *Water resources, *Groundwater, *Infiltration, *Hawaii, Rainfall, Perched water, Basalts, Saline water intrusion, Runoff.
Identifiers: *Volcanic terrane, Kau area, Hawaii.

Groundwater and rainwater caught on roofs and rainsheds are the only water sources in the Kau area, which includes the slopes of Mauna Loa, Hawaii, because infiltration of the 15-125 in. annual rainfall into the highly permeable lava flows, ash, and tuff is so rapid that no streams are perennial. Groundwater is discharged principally from springs near the shore at the outcrop of the basal groundwater body; (visible spring discharge is 30-50 mgd). The basal water is brackish for a considerable distance inland in most of Kau. Pumpage is less than 3 mgd. Perched water occurs in lava flows in the uplands from Pahala to Naalehu and discharges in springs, seeps, and numerous water-development tunnels. Average total tunnel flow is 1-2 mgd, and many tunnels are abandoned because the water was used to flume cane, which is no longer done. A thick body of high-level groundwater is impounded to 230 ft above sea level by an undetermined geological structure near Pahala. A shaft with drilled wells taps the reservoir and about 1.5 mgd is pumped but the extent and potential yield of the reservoir are not known. (Knapp-USGS)

WATER RESOURCES AND SURFICIAL GEOLOGY OF THE HOMER AREA, SOUTH-CENTRAL ALASKA,
U S Geological Survey.
Roger M. Waller, Alvin J. Feulner, and Donald A. Morris.
U S Geol Surv Hydrol Invest Atlas HA-187, 1 sheet, 1968. 3 map, 1 photo, 1 tab, 2 chart, 9 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Hydrogeology, Aquifers, Hydrologic data, Logging (Recording), Water levels, Springs, Water sources, Water yield, Specific capacity, Alaska.
Identifiers: Homer, Alaska.

The groundwater resources of the Homer area, at the southern end of the Kenai Peninsula, Alaska, are described. The use of surface water is not practical because of insufficient flow in nearby streams and long distance to an adequate supply. Most of the wells drilled into Cretaceous Kenai Formation at the lower altitudes yield less than 10 gpm. The largest recorded specific capacity was 0.25 gpm per ft. On top of the 1100 ft high escarpment north of Homer, wells in the Kenai Formation yield 50-100 gpm with a specific capacity of 1 gpm per ft. Quaternary sands and gravels yield about as much water as the Kenai Formation. No fresh water is available under Kenai Spit, where most of the area's industry is located. Groundwater is of the Na-Ca-bicarbonate type with as much as 30 ppm Fe and some combustible gas. Additional development of groundwater north of the escarpment seems feasible. The water in test holes is of good quality and contains 1-2 ppm Fe. Maps scaled 1:63,360 show location of wells and springs, water quality, and surficial geology. A cross section shows relative position of major physiographic and geologic units. (Knapp-USGS)

THE RELATIONSHIP OF FLOODING AND SALINE WATER TABLES,
S. T. Smith.
Western Australia Dept of Agr J, Ser 4, 7 (s), pp 334-335; 338-340, August 1966. 5 p, 4 fig, 2 photo.

Descriptors: *Flooding, *Saline water, Groundwater movement, *Water table, Base flow, Aquifers, Underground streams, Land clearing, Surface drainage, Valleys, *Saturated soils, Bores, Water properties, Water pressure, Confined water, *Seepage.

In Western Australia there are several ways in which salt manifests itself. The most serious and extensive of these is in the valley systems where shallow saline water tables occur. This type of salt problem is called 'valley waterlogging' and occurs in most of the flat valleys throughout Western Australia. Underground water movement studies were carried out in seven valleys. The studies consisted of drilling bores to various depths both across and down each valley to tap the underground water. Four areas of water characteristics were determined when the potential pressure of the water was measured. The aspects studied were: whether the water was confined, seasonal fluctuation of the water table, continuity of underground aquifers and the direction of flow. Studies indicated that it is the water entering the higher country and passing beyond the reach of plant roots and seeping into the valley that causes water tables. Water tables did not arise from flooding. Clearing the land had greatly accelerated rising water tables. Surface drainage would have little or no effect on rising water tables. (Blecker-Ariz)

RADIOMETRIC STUDIES OF THE FLORIDAN AQUIFER,
Florida State Univ., Tallahassee, Florida.
J. K. Osmond, and B. F. Buie.
Office of Water Resources Research, Project Completion Report A-005-FLA July 1968. 40 pp, 9 fig, 1 tab, 30 ref.

LIBRARY U. OF I. URBANA CHAMPAIGN

Descriptors: *Uranium radioisotopes, *Tritium, *Florida, *Groundwater movement, Gravity studies, Seismic studies, Groundwater recharge, Aquifer, Radioisotopes.

Research under grant A-005-FLA of the Office of Water Resources Research has been concerned with three aspects of the Floridan aquifer near Tallahassee, Florida: (1) Data on the concentration of uranium and the variations of uranium isotopes (U-234/U-238) provide a method of estimating quantitatively the volumes of sources contributing to the aquifer. Both the techniques of isotopic analysis and method of data analysis have been developed to the point where general application to hydrologic problems seem desirable; (2) Data on the tritium content (H-3) of aquifer water can be used to study time dependent problems of infiltration and aquifer flow. More analyses are needed to complete this type of study, but a new liquid scintillation counting approach (conversion to benzene) has been developed; (3) The results of a study by geophysical methods of the aquifer strata were inconclusive in the case of seismic refraction, but gravimetric traverses suggest that information may be obtained concerning faults and caverns in the limestone aquifer. UNCONFINED AQUIFER CHARACTERISTICS AND WELL FLOW,
Engineering-Science, Inc., Oakland, Calif., and California Univ., Davis.
Houshang Esmaili, and Verne H. Scott.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5872, pp 115-136, Mar 1968. 22 p, 6 fig, 3 tab, 25 ref.

Descriptors: *Groundwater movement, *Unsteady flow, *Aquifer characteristics, Hydraulic conductivity, Storage coefficient, Darcys law, Dupuit-Forcheimer theory, Injection wells, Withdrawal.
Identifiers: Unsteady radial flow.

Numerical solutions are developed for determination of aquifer characteristics and unsteady radial flow through injection wells in unconfined aquifers under constant drawdown and injection pressure conditions. These solutions are based on a numerical solution of the basic differential equation of flow. Appropriate dimensionless parameters are introduced to transform the basic differential equation of flow into an explicit form. Dimensionless graphical solutions are presented for the rate and accumulative volume of discharge and recharge and the radius of expansion of recharge mounds versus time for a range of draw-down and injection pressure values. Numerical examples are presented by applying these solutions to hypothetical field conditions. (Author)

PROGRAMMING FOR PAVLOVSKY'S GROUND-WATER PROBLEM,
Oklahoma Univ., Norman.
George T. Papadopoulos, and Joakim G. Laguros.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5840, pp 49-56, Mar 1968. 8 p, 6 fig, 1 tab, 4 ref.

Descriptors: *Groundwater movement, *Seepage, *Digital computers, *Computer programs, Aquicludes, Water level fluctuations, Irrigation, Drainage.
Identifiers: Pavlovskys method, Kuo method.

The amount of seepage and the free surface profile in an unconfined flow between two water bodies above an inclined impervious layer are highly dependent on the normal depth of flow. Pavlovsky's solution requires a rather time-consuming graphical method of calculating the value of the normal depth. The computer program presented not only reduces the time element but it also encompasses the rising surface and falling surface types of flow for values of slope greater and less than zero and for a range of headwater and tailwater values. This is made possible by using Kuo's method of false position, which is uniquely adapted to problems where the unknown function is expressed unavoidably in terms of the same unknown parameter. Variations in the length of the impervious medium are considered and 1 example is presented. (Author)

GEOLOGICAL STRUCTURE AND ITS EFFECT ON THE GEOTHERMAL HYDROLOGY OF SOUTHWESTERN HREPPAR, ICELAND,
Cornell Univ., Ithaca, N. Y., Geol. Sciences Dept.
George A. Kiersch, and L. N. Chaturvedi.
OWRR Project No. A-020-NY, Cornell Water Resources and Marine Sciences Center, August, 1968. 6 p.

Descriptors: *Geological structures, *Geothermal hydrology, Hot springs.

The report is a summary of results of a field investigation on geothermal hydrology in southwestern Hreppar, Iceland. A Ph.D. thesis in preparation will discuss in detail the structural pattern and the mechanism by which it controls the localization of hot springs. The investigations to date indicate the following results: (1) most of the water at boiling temperatures occurring as hot springs in southwestern Hreppar is meteoric in origin; (2) the water circulates through a system of faults and through permeable zones between basalt flows, the water moves to several thousand feet below the surface and is heated by abnormally high geothermal gradient; (3) rise of this heated water back to surface is carried out again through a system of faults which slowly enlarge into convection conduits; and (4) the localization of hot water in the form of hot springs is controlled by a system of faults which are aligned in three major directions. DRAWDOWNS DUE TO PUMPING FROM STRIP AQUIFERS,
Pakistan Irrigation and Power Dept., Lahore.
S. M. H. Bokhari, J. K. Strachan, and A. K. Turner.

J Irrig and Drainage Div (ASCE), Vol 94, No IR 2, Proc Paper 5981, pp 233-242, June 1968. 9 p, 4 fig, 1 tab. Melbourne Univ., Parkville Australia Affiliate Inst.

Descriptors: *Drawdown, Pumping, Wells, *Aquifers, Recharge, Equations, *Permeability, *Theoretical analysis, Analog models, Boundaries (Surfaces), *Membranes, Mathematical models.
Identifiers: *Strip aquifers, Membrane analogs.

Drawdown patterns due to pumping from wells in long narrow (strip) aquifers were dependant mainly on the type of side boundary (recharge, impermeable). A theoretical solution was developed for an idealized confined aquifer with impermeable boundaries, and the results compared favorably with those obtained from complimentary tests using a membrane analog. Solutions were also given for a simpler case of recharge boundaries. Either the mathematical or membrane solutions are thought to be suitable for field purposes. (Affleck-Ariz)

2G. Water in Soils

SOME PROBLEMS OF SOIL HYDROLOGY,
Academy of Sciences, USSR, V V Dokuchayev Institute of Soil Science.
Yu. F. Gotshalk.
Pochvovedeniye, No 11, pp 100-106, Nov 1967. 6 p, 5 tab, no ref. Soviet Soil Science, Transl by Scripta Technica, Inc, pp 1520-1526, Aug 1968.

Descriptors: *Soil investigation, *Crop production, *Soil moisture, *Methodology, Percolation, Permeability, Translations.
Identifiers: *Soil hydrology, *USSR.

The practical and theoretical significance of soil hydrology is briefly reviewed in relation to the effect of soil moisture on crop productivity in the USSR. Experiments were conducted on the percolation of water through dead roots of lowland peat soils, silty clays, and soils with manure and other organic additives. Results are graphed of an experiment with earthworms in connection with the application of organic fertilizers. The data indicate that soil of the heavily manured plot was more friable and more permeable to water. Also reported are: study on soil supersaturated with water in the vicinity of the Carpathians, and some characteristics of the water regime of soil in an area of excessive wetness. It is concluded that since soil moisture and water reserves of the soil are so variable soil hydrology problems are strictly of zonal character and cannot be evaluated on a unified basis. (Llaverias-USGS)

THERMAL-GRADIENT TRANSPORT OF WATER IN SANDY SOILS,
Academy of Sciences, USSR, V. V. Dokuchayev Institute of Soil Science.
N. F. Kulik.
Pochvovedeniye, No 11, pp 86-98, Nov 1967. 13 p, 9 tab, 3 fig, 11 ref. Soviet Soil Science, Transl by Scripta Technica, Inc, pp 1507-1519, Aug 1968.

Descriptors: *Water conveyance, *Sands, *Thermal radiation, Arid lands, Porosity, Translations.
Identifiers: *USSR, *Thermal diffusion, Temperature fluctuations, Soil hydrology.

In an investigation of the water regime of sandy terrain areas of southeastern European USSR, the thermal-gradient transport of water in soils (thermal diffusion) is briefly discussed. This study involved two phenomena of seasonal and daily soil temperature fluctuations resulting from changes in solar heat received by the earth. Experiments indicate that because of temperature gradients moisture moving in the aeration zone of sand and sandy soils can be utilized by plants. Most plant root systems are located within the zone of influence of the daily temperature fluctuations, where maximum values of water transport are observed. In an arid zone conditions in sand offer wide seasonal and daily temperature fluctuations, and favor utilization of soil moisture. When the temperature difference per cm of the profile is 1C,

the range of change in thermal-gradient water transport in sand and sandy soils is 0.0130 to 0.0150 mm/hr with moisture contents from twice the wilting percentage to the minimum moisture capacity. (Llaverias)

J. R. Philip.
Australian J Soil Res, Vol 6, No 1, pp 1-19, July 1968. 19 p, 5 fig, 4 tab, 23 ref.

Descriptors: *Absorption, *Porous media, *Aggregates, *Soil water movement, *Soil properties, Laplaces equation, Darcys Law, Porosity, Permeability.

The theory of absorption in unsaturated aggregated media is developed to provide a means of studying the applicability of diffusion analysis to transient flows. An aggregated medium is regarded as one made up of macroporosity, through which flow on the Darcy scale occurs, and microporosity, which is free to exchange water with the macroporosity. Absorption is analyzed with the aid of 2 extreme models of macropore flow, one a wet-front model and the other a linearized model. It is found that there is little difference between the solutions for the 2 models. The wet-front model is chosen for further study since it appears to be more realistic and is mor versatile. All models (and general physical considerations) indicate that the aggregated medium behaves initially as a classical medium with sorptivity equal to that of the macroporosity S, and the apparent sorptivity increases with time, ulimately approaching a limiting value greater than S. The cumulative uptake into the microporosity appears to be proportional to time initially, but is finally proportional to the sq root of time. It is concluded that diffusion analysis may usually be applied to aggregated media. Means of analyzing the exceptional cases, such as media containing large aggregates of low sorptivity, are also provided. (Knapp-USGS)

HYDROLOGIC PROPERTIES OF SEVERAL UPLAND FOREST HUMUS TYPES IN THE LAKE STATES REGION,
Michigan State Univ., East Lansing, Department of Forestry.
Wade L. Nutter, and Donald P. White.
Proj completion Rep, June, 1968. 147 p. 27 fig, 7 tab, 42 ref, 4 append.

Descriptors: *Humus, *Hydrologic properties, *Permeability, *Specific retention, *Evaporation, *Moisture tension, Organic soils, Porosity, Forest soils, Moisture content, Soil water movement.
Identifiers: Mulches.

Relatively undisturbed humus samples 16.5 cm in diameter and 25.4 cm deep were taken from 10 sites in forested Michigan regions and studied in the laboratory to determine the hydrological effect of humus on evaporation, infiltration, and water distribution, and to learn of the hydrology of humus formation. Humus types sampled are mull, duff-mull, mor, and a pseudo-duff mull. The mulls and duff-mulls held more water after drainage from saturation than the mors. The mors lost 80% by evaporation compared with 60% for the mulls and duff-mulls at high potential evaporation. Water moves rapidly through dry organic soils, wetting them only slightly. The suggestion that humus holds water for later infiltration does not seem to be valid, but if humus horizons become saturated during storms of long duration, they can hold water against overland flow because of their high porosity. Humus types cannot be classified by hydrologic properties alone, but their hydrologic properties parallel the present classification system and support the validity of the distinct types described in the Great Lakes Region. WATER MOVEMENT IN DRY SOILS I. PHYSICAL FACTORS AFFECTING SORPTION OF WATER BY DRY SOIL,
Rothamsted Experimental Station, Harpenden, Herts., England.
D. A. Rose.
J of Soil Sci, Vol 19, No 1, pp 81-93, March 1968. 13 p, 9 fig, 4 tab.

Descriptors: *Soil water movement, Soil moisture, Arid lands, Atmosphere, Diffusivity, *Temperature, Salinity, Evaporation control, Environmental effects, *Sorption, Water vapor, Water transfer, Equations, Soil aggregates, *Moisture content, *Soil physics.

The paper considered effects of various soil physical conditions on uptake of water from a moist atmosphere by a soil sufficiently dry that both liquid and vapor components of flow may be important. Water extraction by growing plants will dry soil in the root zone to c pF 4.2 and natural evaporation can dry surface layers to c pF 6 or even drier in arid regions. Theoretical aspects of water movement in dry soils were explained using 5 equations. Sorption took place in soil columns that were in a turbulent atmosphere at constant temperature and realtive humidity. Diffusivity rose to a maximum and then fell as water content increased. Effects of environment and management were studied in the areas of temperature, pressure, porosity, organic manure, aggregate size, still atmosphere, mulching, salinity, evaporation suppressents, ignition and degradation of structure. In the dry soils tested, water movement was a mixture of liquid and vapor transfer and the relative importance of the two modes of flow varied from soil to soil. The data showed the effect of pre-treatment on diffusity and sorptivity but there was no experience yet to indicate what changes might have agricultural significance. (Blecker-Ariz)

CLIMATES OF SOME GREAT SOIL GROUPS OF THE WESTERN UNITED STATES,
California Univ., Berkeley.
Rodney J. Arkley.
Soil Sci, Vol 103, No 6, pp 389-400, June 1967. 12 p, 5 fig.

Descriptors: *Climatic zones, Arid climates, Weathering, *Soil types, Soil moisture, Soil formation, Soil temperature, Air temperature, Leaching, Plant growth, Evapotranspiration, Organic matter, Precipitation excess, Rainfall, *Reclamation states, *Water balance, Storage capacity.

This paper summarizes an investigation of the distribution of soils in the 11 western states in relation to climatic parameters taken from the water-balance analysis of 1082 climatic stations. The water-balance approach to climatic classification developed by Thornthwaite was used to relate climate directly to soil-forming processes. The method permitted an evaluation of the approximate moisture regime of soils throughout the year as well as the amount of water available for leaching and for plant growth. The leaching effectiveness of the climate, the actual evapotranspiration, and the mean annual temperature considered simultaneously served to represent climatic factors most closely related to the kind of 'zonal' soils one would expect to find under each climate. The results indicate that soils in arid climates were effected by evapotranspiration, accumulation and decomposition of organic matter, central 'core' climate, air and soil temperature, rainfall, leaching, excess of precipitation and soil moisture-storage capacity. (Blecker-Ariz)

THE WATER BUDGET OF IRRIGATED PASTURE LAND NEAR MURRAY BRIDGE, SOUTH AUSTRALIA,
Australia Dept. of Agriculture, Adelaide.
J. W. Holmes, and C. L. Watson.
Agr Meteorol, Vol 4, No 3, pp 177-188, May 1967. 12 p, 2 fig, 1 tab, 1 append.

Descriptors: Irrigation practices, Pastures, *Irrigation efficiency, Arid climates, Rainfall, Seepage, *Evaporation, Surface drainage, *Lysimeters, Radiation, *Hydrologic budget, Climatic data, *Equations.

The measurement of water efficiency on an irrigation district basis was often inaccurate because of inadequate control of factors that occur in arid climates. The purpose of the experiment was to measure components of the water balance which included rainfall, amount of irrigation, evaporation, surface and underground drainage. Techniques of measurement yielded a standard error of about 10% of the total water inventory. The evaporation, measured with the help of small lysimeters, was strongly correlated with measured net radiation. Three formulae for estimating evaporation, based on large weighable lysimeters, were tried. By suitable choice of the coefficient for introducing the effect of the drying power of the air into the formula, it was possible to obtain a close estimate of evaporation. The correlation was no better than the correlation between evaporation and net radiation. (Blecker-Ariz)

INFILTRATION IN SANDS AND ITS RELATION TO GROUNDWATER RECHARGE,
U. S. Geological Survey, Washington, D. C.
W. O. Smith.
Water Resources Res, Vol 3, No 2, pp 539-555, 1967. 17 p, 8 fig.

Descriptors: *Infiltration, Capillary conductivity, Hydraulic conductivity, Soil moisture, *Sands, *Groundwater recharge, Arid climates, Topography, Field capacity, *Sediments, Equations, Retention, Rocks.

Sediments consisting of boulders, gravel, sand and silt are, in addition to fissured rocks, the principle rocks capable of infiltration adequate for substantial groundwater recharge in arid climates. The problem considered in the study was infiltration into sands as related to groundwater recharge. The principles of capillarity applicable to infiltration process were reviewed. Qualitative experiments were described to show the nature of the hydraulic transfer process in sands. The problem of how deeply a given rain will penetrate into a sand, and under what conditions it will contribute to the recharge of groundwater, are considered. Influence of topography on groundwater recharge and the nature of specific retention or field capacity in sands were discussed. The infiltration process in dry sand consisted essentially of the downward passage of bulk water. Infiltration in sands was a simple hydraulic process subject only to modification by capillarity arising from the internal pore structure of the sand. The amount of water extracted from the infiltrating mass by a dry sand was determined by the specific retention of the sand. (Blecker-Ariz)

IN SITU MEASUREMENT OF SOIL SALINITY WITH A SENSOR,
U. S. Salinity Lab., Riverside, Calif.
J. D. Oster, and R. D. Ingvalson.
Soil Science Soc Proc, Vol 31, No 4, pp 572-574, July-August 1967. 3 p, 2 fig, 1 tab.

Descriptors: *Saline soils, *Electrical conductance, *Temperature, Plant physiology, Soil profiles, Soil water movement, Irrigation effects, Moisture uptake, *Measurement, Soil-water-plant relationships, Electrodes.
Identifiers: *Thermistors, *Sensors.

Electrical conductivity (EC) of the soil solution was measured in situ with a salinity sensor whose salt-sensitive element was a ceramic electrical conductivity cell. The face electrode was covered with a thin layer of ceramic, thereby preventing dislodgment of the electrode and improving the stability of the sensor. The temperature correction used values from tables corresponding to the temperature as measured by the thermistor. The sensors measured changes in EC during an irrigation cycle due to water uptake by the plant and salt movement in the soil profile by convection of salt in the soil water. The accuracy of the measurement was estimated at plus or minus 0.5 mmho/cm. (Blecker-Ariz)

THE QUALITY OF WATERS PERCOLATING THROUGH STRATIFIED SUBSTRATA, AS PREDICTED BY COMPUTER ANALYSES,
California Univ., Water Resources Center, Davis.
K. K. Tanji, L. D. Doneen, and J. L. Paul.
Hilgardia, Vol 38, No 9, pp 319-347, June 1967. 29 p, 17 fig, 5 tab, 6 append.

Descriptors: *Water quality, *Computer programs, *Soil profiles, *Soil chemical properties, Arid climates, Saturated soils, Percolating water, Gypsum, Cation exchange, Stratfied flow, Equations, *Saturation, Analytical techniques, Stratification, Solutes.

This paper presented theoretical consideration and procedures utilized in Fortran computer programs and resulting predictions on quality of waters percolating through three substrata profiles in the arid San Joaquin Valley of California. A study was done on prediction of chemical changes induced by saturating a stratfied substrata profile, prediction of quality of the percolating water and changes in chemical properties of the profile. Comprehensive predictions on solute concentrations in the percolate and chemical changes in the substrata profile were presented. Formulations in the computer programs were based on theoretical considerations concerning solubility and dissociation of gypsum and cation exchange. (Blecker-Ariz)

ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5843, pp 57-71, Mar 1968. 15 p, 3 fig, 3 tab, 23 ref, 2 append.

Descriptors: *Permeability, *Porous media, *Soils, *Pore pressure, Drainage, Model studies, Equations, Soil compaction, Saturation, Regression analysis.
Identifiers: Capillary pressure-permeability relationships, Porosity-permeability relationships, Kozeny equations.

An equation is presented for calculating saturated permeability from capillary pressure-desaturation data. The use of this equation along with the relative permeability equations of Brooks and Corey is proposed for calculating the permeability of both saturated and partially saturated media. The analysis leading to the development of the equation is based on theory developed in the petroleum industry. The equation utilizes parameters introduced by Brooks and Corey for describing the hydraulic behavior of partially saturated porous media on the drainage cycle. In laboratory measurements, the permeability of three disturbed soils each packed at 5 different values of porosity was determined at various capillary pressures. Predicted relationships were calculated using capillary pressure-desaturation data in the new equation and in the relative permeability equations of Brooks and Corey. Calculated and experimental values of permeability agreed within 27% over the range of capillary pressures studied. (Knapp-USGS)

A SOIL MOISTURE REGIME AND MICROCLIMATOLOGICAL STUDY OVER SAND DUNES IN WESTERN RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur, Rajasthan, India.
A. Krishnan, P. N. Bhatt, and P. Rakhecha.
Ann of Arid Zone, Vol 5, No 1, pp 1-9, March 1966. 9 p, 4 fig, 3 tab.

Descriptors: *Sands, Dunes, *Soil moisture, Climatic data, Ecology, Soil temperature, Air temperature, Humidity, *Microclimatology, Monsoons, Arid lands, Vegetation establishment.
Identifiers: *India.

In order to study the microclimate and soil moisture regime of the dunes of Rajasthan, stabilized and unstabilized dunes at Osian were selected. Diurnal cycle, microclimate and soil moisture observations were taken on two days during the four seasons: winter, hot weather period, monsoon and post monsoon. High moisture concentration occurred below 4 meter depth in the stabilized sand dune during March to July and below 1.5 meter depth in the unstabilized sand dune throughout the year. Vertical moisture movement under the influence of temperature gradients appeared to be the factor causing this occurrence. (Affleck-Ariz)

2H. Lakes

ON THE INFLUENCE OF THE POLDERING OF LAKE TOGO-IKE FOR THE TOGO HOT SPRING GROUP,
Japanese Society of Limnology, Otsu, Japan.
Kinzo Seno, Soki Yamamoto, and Shirobe Kiuchi.
Jap J of Limnol, Vol 29, No 1, pp 1-12, May 1968. 12 p, 7 fig, 6 tab.

Descriptors: *Surface-groundwater relationships, *Hot springs, *Water temperature, *Discharge (Water), Water-level fluctuations, Chlorides, Sulfate, Tidal effects, Water quality.
Identifiers: Poldering, Lake Togo-ike, Japan.

The influence of change in lake level on the discharge of hot springs at Lake Togo-ike, a brackish lake situated in the middle of Tottori Prefecture, was studied. All of the springs of the Togo hot spring group have the same chemical constituents and ground temperature, suggesting that they have a common origin. Some of these springs discharge through the lake bottom, but they have little influence on quality of the lake water. Factors which will affect spring discharge are barometric pressure, rainfall lake-level change, tides, and pumping. Barometric and tidal effects are not separated. The effect of lake-level changes on the spring discharge, which is larger at Azusa than at Togo, suggests that change of lake level directly affects the discharge of hot springs. It is concluded that deepening of this lake will cause a decrease of hot springs discharge. (Knapp-USGS)

Identifiers: Yubara-Ko Lake, Japan.

The limnological features of Yubara-ko, a man-made lake in the northern part of Okayama Prefecture, which stores water for hydroelectric power, were investigated on August 7-10, 1965, 10 yr after the water was impounded. The metalimnion developed between 15-16m and 23m. The color of water is Forel's Nos. 6-9, the Secchi's disc transparency varies from 1.5 to 4.0m. The pH-values range from 7.2 to 7.4 in the surface and from 6.0 to 7.3 in the bottom water. The contents of dissolved oxygen vary between 7.88-10.56 ppm in the surface and 8.67-10.4 ppm in the bottom water. Total Fe is 0.004-0.48 ppm in the bottom water. The amount of ammonium is 0.08 ppm, four times as much as that in 1958. Nutrients in the water have become richer in the past 10 yr. Of 30 species of plankton found, 11 are phytoplankton and 19 zooplankton. The plankton concentration ranged from 5,370 per 10 liters to 121 per 10 liters. (Knapp-USGS)

FORECASTING THE LEVELS OF THE GREAT LAKES,
U. S. Lake Survey, Detroit, Michigan.
B. G. Decooke, and E. Megerian.
Water Resources Research, Vol 3, No 2, pp 397-403, Second Quarter 1967. 7 p, 4 tab, 5 ref, 1 append.

Descriptors: *Forecasting, *Great Lakes, Water levels, Temperature, Precipitation, Time series analysis.
Identifiers: *Net Basin Supply, Multiple linear regressions, Current trend.

A description is given of the U. S. Lake Survey method of forecasting Great Lakes water levels. The method, in general, consists of determining a level for each month of a 6-month forecast period on each of the Great Lakes by routing a predicted volume of water (Net Basin Supply) to each of the Great Lakes basins. The technique employed in prediction of the volume of the water consists of using multiple linear regressions based upon U. S.

Weather Bureau precipitation and temperature data as predictors for the first month and trend predictors for the second through the sixth month. This technique results in forecasting of lake levels on the average from 15 to 40% closer to the recorded lake levels, in comparison with the technique that utilizes the long-term average volume of water as the basis of projection. 2I. Water in Plants

EFFECTS OF MOISTURE STRESS ON GERMINATION OF ALKALI SACATON, GALLETA AND BLUE GRAMA,
U. S. Forest Serv., Rocky Mountain Forest and Range Experiment Station, Albuquerque.
O. D. Knipe.
J Range Manage, Vol 21, No 1, pp 3-4, January 1968. 2 p, 1 fig, 2 tab.

Descriptors: *Grasses, *Moisture tension, *Seeds, Germination, *Moisture stress, Aqueous solutions.

The objective of the study was to determine the effect of moisture stress and seed germination. Seeds were collected within the arid Rio Puerco watershed near the village of San Luis, 58 miles northwest of Albuquerque, New Mexico. Each species was replicated four times at moisture tension levels of 0, 1, 4, 7, 10, 13, and 16 atm. Alkali sacaton was affected most by increases in moisture tension. Percent germination of alkali sacaton was significantly reduced by 1 atm moisture tension, and was further reduced by each 3 atm increase with the exception of 13 to 16 atm. Present germination of galleta and blue grama was not significantly reduced until a moisture tension of 10 atm was reached. The rapidity of germination of galleta and blue grama was delayed by moisture tension of 4 atm and the rapidity of germination of alkali sacaton was delayed by a moisture tension of 1 atm. EFFECT OF TEMPERATURE ON NET ASSIMILATION RATE,
GSIRO, Canberra, Australia, Division of Plant Industry.
J. Warren Wilson.
Ann of Botany, N S, Vol 30, No 120, pp 753-761, 1966. 11 p, 2 fig, 1 tab, 23 ref.

Descriptors: *Temperature, Leaves, Arid climates, Sorghum, *Growth rates, Plant physiology, Regression analysis, *Plant growth.
Identifiers: *Assimilation rate, Dry matter, Rape, Sunflower.

The net assimilation rates (rate of increase of dry matter per unit leaf area) and other growth attributes were compared for rape, sunflower and maize plants growing at temperatures of 10, 16, 22, 28 and 34 deg C. These plants were grown in arid climates. Plants were widely spaced to reduce the mutual shading effect and grown under 3,000 f c fluorescent lighting to simulate summer weather. The estimates of the net assimilation rate (EA) suggested that the optimum temperature was lowest in rape (just over 20 deg C) and highest in maize (just below 30 deg C). Relative growth-rate (RW) was almost identical with relative leaf-area growth-rate (RA) at each temperature for rape and sunflower and both RW and RA rose more steeply than EA with increasing temperature. In hot climates EA fell with an increase in temperature in those species which had low optima. In warm conditions the EA rate varied little with temperature by only plus or minus 10% between 12 and 30 deg C for rape and 23 and 36 deg C for maize. (Blecker-Ariz)

THE COMPOSITION OF SEVERAL ARID SPINIFEX GRASSLANDS OF CENTRAL AUSTRALIA IN RELATION TO RAINFALL, SOIL WATER RELATIONS, AND NUTRIENTS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research.
R. E. Winkworth.
Australia J of Botany, Vol 15, No 1, pp 107-130, 1967. 24 p,3 fig, 3 plate, 13 tab, 18 ref.

Descriptors: *Grasslands, Arid climates, Biological communities, Climatic data, Soil-water-plant relationships, *Rainfall, *Temperature, Humidity, Evaporation, Geomorphology, Soil physical properties, Soil chemical properties, Plant physiology, *Soil profiles, *Vegetation, Sands, Clays, Vegetation regrowth, Environmental effects.

The paper reports the community analysis and associated climatic and soil studies of arid spinifex grasslands in five locations in the Northern Territory. All sand-plains were flat to broadly undulating. A study of the arid climate included rainfall, temperature, relative humidity and tank evaporation. Soils were studied with respect to morphology, physical and chemical properties and plant nutrition. The outstanding feature of the soils was their sandy nature, the profiles having large proportions of sand and low clay contents down to the underlying substrates. The vegetation study included a general description of where the plants were found, their floristic differences and quantitative community characteristics. Uniformity of the sand-plain vegetation of central Australia overrode minor geographical differences. The main climatic feature was the increase in rainfall from 5 in. annually to 14 in. from south to north. Communities regenerating from fire were very extensive (about 4000 sq. miles). The almost exclusive occupancy of the sand-plains by spinifex suggested true adaption to this soil environment. (Blecker-Ariz)

COMPETITION BETWEEN BURROWEED AND ANNUAL AND PERENNIAL GRASSES FOR SOIL MOISTURE,
U. S. Forest Serv., Rocky Mountain Forest and Range Experiment Station, Tucson.
Dwight R. Cable.
Proc Amer Forage and Grassland Counc, pp 11-27, 1966. 17 p, 8 fig.

Descriptors: *Grasses, Plant groupings, Semiarid climates, Vegetation, Root development, Root distribution, *Root systems, Environmental effects, Summer, *Competition, Ecology, *Soil moisture, Annual, Growth states, *Plant growth, Phenology, Water requirements.
Identifiers: *Perennial, *Burroweed.

A study was conducted to determine the extent of competition for soil moisture between annual grass, perennial grass and burroweed and the influence of rooting habits and growth cycles on these competitive relations. The study was conducted on the Santa Rita Experimental Range, south of Tucson, Arizona, in a semidesert grass-shrub type area. The areas studied were herbage production, plant root systems, phenological development and moisture extraction patterns under different types of vegetation cover. Perennial grass production was reduced about 20% on plots with annual grass or burroweed competition and about 44% on plots with both. Because burroweed has a taproot system with little lateral spread and is primarily a spring grower, summer yields of annual and perennial grasses are only moderately affected by the presence of burroweed. Perennial grass, because of its deeper and perennial rooting habit, competed strongly with annual grasses during the summer growing season. (Blecker-Ariz)

WATER STRESS IN NATIVE VEGETATION DURING THE DROUGHT OF 1965,
Australia Commonwealth Sci. Indus. Research Org., Canberra.
E. W. Pook, A. B. Costin, and C. W. E. Moore.
Aust J Bot, Vol 14, No 2, pp 257-267, July 1966. 11 p, 4 tab, 3 plate.

Descriptors: *Moisture stress, Vegetation, *Droughts, Fine-textured soils, Trees, Soil moisture, *Moisture content, *Biological communities, Rainfall, Soil profiles, Crop response, Wilting, *Soil-water-plant relationships, Leaves.

Reported in this paper is the reaction of native vegetation in parts of the Australian Capital Territory and Monaro Region where drought occurred in 1965. The general pattern was for wilting to occur in lightertextured, stonier, or shallower soils, especially on steep and sunny aspects. Variation between the species of Eucalyptus was largely a reflection of site differences. Trees of all size classes showed signs of water stress. Relative moisture content of the foliage of E rossii on E macrorhyncha could be low before signs of water stress were obvious. Comparison of moisture contents of whole trees showing different degrees of water stress indicated that the prolonged period of dehydration had caused general drying out of the trees, rather than only leaf and twig desiccation. The differences in soil moisture storage were chiefly a function of soil volume, as determined by profile depth and proportion of fine soil particles. It was suggested that the so-called ineffective summer rain in south-eastern Australia was both effective and essential for native communities on soils of low water-holding capacity. The role of drought in distribution of native communities was discussed. (Blecker-Ariz)

2J. Erosion and Sedimentation

SEDIMENTARY AND FAUNAL FACIES ASSOCIATED WITH THE DRAINING OF CROPSTON RESERVOIR,
Nottingham Univ., Department of Geology, Great Britain.
W. A. Cummins, and A. J. Rundle.
The Mercian Geologist, Vol 2, No 4, pp 389-400, Aug 1968. 10 p, 2 fig, 1 tab, 2 plate, 3 ref.

Descriptors: *Reservoirs, *Drainage effects, *Erosion, *Biological communities, *Sedimentation, Aquatic environment.
Identifiers: *Reservoir drainage, *Leicester, Great Britain, Faunal assemblages.

The sedimentary and faunal changes resulting from the draining of Cropston Reservoir in Charnwood Forest, which supplied water to Leicester, England, were studied. The reservoir had been in continuous use for 95 years. The slow uniform deposition of black mud was interrupted and a new pattern of erosion, sedimentation and desiccation destroyed the molluscan fauna. Shoreline reed flora continued to flourish. Bottom muds were eroded and redeposited nearer the dam. Remains of the molluscan fauna were sampled and listed. The features produced by draining the reservoir are studied in terms of their preservation in the geological record when the reservoir is refilled and black mud sedimentation is resumed. Observation of a geological process taking place should help in the interpretation of the past geological record. (Knapp-USGS)

URBANIZATION'S EFFECT ON SEDIMENT YIELD IN NEW JERSEY,
U S Geological Survey.
Peter W. Anderson, and John E. McCall.
J Soil and Water Conserv, Vol 23, No 4, pp 142-144, July-Aug 1968. 3 p, 5 fig, 2 ref.

Descriptors: *Sediment yield, *Urbanization, Streams, Runoff, Storm runoff, New Jersey, Delaware River, Water pollution.
Identifiers: Philadelphia, Trenton, New York City.

Data on sediment content of New Jersey streams are summarized; they suggest that yields are proportional to the degree of urbanization. The sparsely populated Pine Barrens yield 10-40 tons per sq mi per yr. The moderately heavily urbanized Delaware River area yields 25-100 tons generally, and up to 500 tons near Philadelphia. The northwestern area of New Jersey is hilly with steep slopes and rapid runoff, but a low degree of urbanization; its sediment yields are 25-100 tons per sq mi per yr, while yields in the Trenton-New York City area, which is very heavily urbanized and probably has about the same topography and natural sediment yield as the northwestern area, are several thousand tons. Bacteria and organic content of water are also much higher in urban streams. In the Delaware River near Trenton, 5-25% of the suspended load is oxidizable. The U S Geological Survey is studying the effects of urbanization on sediment in the Stony Brook Basin, about 48 sq mi in area, 10 mi north of Trenton. The amount of sediment for a given rate of runoff has increased significantly with urbanization of the area from 1956 to 1958. (Knapp-USGS)
W69-00118

SEDIMENTATION IN THE NATION'S RESERVOIRS,
Department of Agriculture, Oxford, Mississippi, Sedimentation Laboratory.
Farris E. Dendy.
J Soil and Water Conserv, Vol 23, No 4, pp 135-137, July-Aug 1968. 3 p, 5 fig, 1 tab, 15 ref.

Descriptors: *Reservoir silting, Sediment yield, Reservoir storage, Trap efficiency.
Identifiers: Reservoir storage depletion.

Reservoir sedimentation data compiled by the U S Department of Agriculture Sedimentation Laboratory are summarized. The Nation's 968 reservoirs range from small ponds to over 1 million acre-ft. Annual average storage loss was 150,000 acre-ft, about 0.2% of initial total capacity, well within the design requirments of most reservoirs. Average depletion rates are much higher in reservoirs of 100 acre-ft or less, which account for only a small part of total reservoir capacity, but are 40% of the total number of reservoirs. Depletion was less than 1% for 58% of the reservoirs larger than 100,000 acre-ft, over 3% for 15% of the reservoirs, and in excess of 10% for only 2% of the reservoirs. Average sediment accumulation rates, in general, decrease as drainage area increases. Prediction of depletion rates can be successful only if local empirically determined relationships are used. The conclusions reached are that the depletion rate of 0.2% is not alarming, the 3% rate in small upland and reservoirs seems excessive, and if present rates continue, about 20% of small reservoirs will be half filled with silt in 30 years. (Knapp-USGS)

DILUTION METHODS OF MEASURING TRANSPORT OF SAND FROM A POINT SOURCE,
Hydraulics Research Station, Wallingford, Berkshire, England.
G. H. Lean, and M. J. Crickmore.
J of Geophys Res, Vol 71, No 24, pp 5843-5855, December 1966. 13 p, 12 fig, 4 tab.

Descriptors: Transportation, *Sands, Channels, Measurement, Particle size, *Velocity, Elevation, Dye releases, *Tracers, Flow, Dispersion, *Diffusion, *Equations, Steady flow, Sediment transport, Mixing, Streams.
Identifiers: *Point source, *Transport.

The object of the investigation was to compare lateral dispersion of sand and water in the absence of a lateral velocity gradient and to examine the validity of the point source tracer method for measurement of sand transport. Distribution of labeled particles from a steady point source and mean velocity and vertical diffusion coefficient were discussed using equations. The experiments demonstrated that in steady flow constant-dilution and time integration methods could be applied to measurement of sand transport by injection at a point source, provided that sediment transport was uniform across the width of the channel and a sufficient distance (20 feet in the case studied) was allowed between the point and measuring section for mixing. Independence of tracer concentration in elevation allows the method to be applied to samples taken in the suspended flow. Tracer concentrations measured both on the bed and in the water resulted in transport values accurate to within 5% for positions beyond the mixing distance. The methods described could be used to study transport of sand in streams and rivers in arid areas. (Blecker-Ariz)

PROCESSES ON ARID-REGION ALLUVIAL FANS,
Minnesota Univ., Dept. of Geology and Geophysics.
Roger LeB Hooke.
J of Geology, Vol 75, No 4, pp 438-460, July 1967. 23 p, 10 fig, 5 tab, 23 ref, 1 append.

Descriptors: *Alluvial channels, *Channel morphology, Slopes, Petrography, Infiltration, Weathering, *Arid lands, Sediment discharge, Sediment transport, Alluvium, Geomorphology, Deposition (Sediments), Model studies, Mudflows, Sands.
Identifiers: *Fans.

The object of the study was to understand processes acting on fans and features produced by these processes. Three fans were studied in the desert region of California. Reconnaissance work included qualitative observations of features such as debris size, lithology, channel form, fan area and slope. The laboratory study included fan morphology, qualitative relationships among fan slope, water discharge, debris-flow behavior and depth of fanhead incision. The fans had six distinguishable ages of alluvium and segmented profiles which may have resulted from tectonic disturbance of the fan-source system. Small alluvial fans were built of mud and sand in a laboratory apparatus. These fans were not intended to be scale models of a natural fan but were treated as small fans in their own right. Justification for use of laboratory models was given. General equivalence of slopes on laboratory and natural fans indicated that gross scaling relationships between debris size and discharge were similar. Areas of debris flows, fluvial processes, mechanics of sediment transport, fan morphology, water flows, infiltration and sieve deposition, channels and deposition on alluvial fans and fanhead incision were discussed. (Blecker-Ariz)

A MONOGRAPH ON SEDIMENT TRANSPORT IN ALLUVIAL STREAMS,
Denmark Technical Univ., Copenhagen.
Frank Engelund, and Eggert Hansen.
Monogr, Denmark Tech Univ, Hydraul Lab, 62 p, 1967. 30 fig, 3 tab, 31 ref.

Descriptors: *Sediment transport, *Alluvial channels, *Streams, *Channel flow, *Stage-discharge relations, Water conveyance, Hydraulics.
Identifiers: Channel design, Monograph.

Transport of sediments in alluvial streams is explained in a generally non-mathematical or 'engineering' sense, and the basic mechanism of sediment transport is reviewed in a short text taken from lectures given at the University of Denmark. Part of the book is based on research in the Hydraulic Laboratory in Copenhagen and has not previously been presented except in discussions or progress reports. The topics covered are sediment properties, hydraulics of alluvial streams, the similarity principle, fluviology, and numerical examples of prediction of stage-discharge relations and design of channels. 2K. Chemical Processes

GEOCHEMISTRY OF GROUNDWATER FROM UPPER CRETACEOUS-LOWER TERTIARY SAND AQUIFERS IN SOUTH-WESTERN VICTORIA, AUSTRALIA,
Geological Survey, Melbourne, Australia, Mines Department.
M. W. Johns.
J Hydrol, Vol 6, No 4, pp 337-357, Aug 1968. 21 p, 4 fig, 2 tab, 22 ref.

Descriptors: *Water chemistry, *Groundwater, Groundwater basin, Saline water, Sodium, Chlorides, Ion exchange, Magnesium, Sulfates, Carbonates.
Identifiers: *Geochemical processes, Otway Basin, Victoria, Australia.

The groundwater chemistry of the sand aquifers in the upper Cretaceous and Lower Teriary of the Otway Basin, SW Victoria, Australia was studied by considering separately the main geochemical processes that produce variations in water composition. The processes are cation exchanges in-

volved in formation of sodium bicarbonate, release of carbonic acid with variations in alkalinity, incorporation of originally oceanic saline water, and variations of sulfate-chloride ratio by sulfate accumulation or bacterial action. The waters have been divided into several classes. Class A has Na:Cl less than 80, class B has Na:Cl between 80 and 95, class C has Na:Cl over 95 and Mg:Cl over 20, and class D has Na:Cl over 95 and Mg:Cl less than 20. Class B, C, and D waters are found elsewhere in Australia, but class A water is found only in the Otway Basin. (Knapp-USGS)

INTERACTION BETWEEN ALUMINUM AND PHOSPHATE IN AQUEOUS SOLUTION,
Rutgers Univ., New Brunswick, New Jersey.
Pa Ho Hsu.
Advances in Chem Ser, No 73, pp 115-127, 1968. 13 p, 3 fig, 2 tab, 17 ref.

Descriptors: *Phosphate, *Aluminum, *Inorganic compounds, *Water chemistry.
Identifiers: Complex ions, Polymers.

Hydroxy-aluminum solutions with NaOH/Al molar ratios from 0 to 2.7 were mixed with a sodium phosphate solution to give a phosphate/Al ratio from 0 to 15, and it was found that hydroxy-aluminum polymers and Al ion did not yield the same reaction products with phosphate. The complete precipitation of hydroxy-aluminum polymers by phosphate at their isoelectric points was interpreted to be a simple 'neutralization' of the net positive charge of the polymer by the phosphate anion. Aluminum formed soluble complexes with phosphate up to a phosphate/Al molar ratio of 8. In solution with polymers and Al ions, each reacted with phosphate separately because there is no rapid equilibrium between Al ion and polymers. (Knapp-USGS)

CONTROLS ON Mn, Fe, Co, Ni, Cu, AND Zn CONCENTRATIONS IN SOILS AND WATER: THE SIGNIFICANT ROLE OF HYDROUS Mn AND Fe OXIDES,
U. S. Geological Survey, Denver, Colorado.
E. A. Jenne.
Advances in Chem Ser, No 73, pp 337-387, 1968. 51 p, 6 fig, 1 tab, 257 ref.

Descriptors: *Trace elements, *Soil chemical properties, *Oxides, *Water chemistry, *Sorption, Chelation, Organic matter, Carbonates, Clays.
Identifiers: Hydrous oxides, Complex ions.

It is proposed that the hydrous oxides of Mn and Fe, in general, furnish the principal control on the fixation of Co, Ni, Cu, and Zn (heavy metals) in soils and fresh water sediments; hydrous oxides of Mn and Fe are nearly ubiquitous in clays, soils, and sediments. The common occurrence of these oxides as coating, allows the oxides to exert chemical activity far out of proportion to their total concentrations. Sorption or desorption of these heavy metals occurs in response to the following factors: (1) aqueous concentration of the metal in question; (2) aqueous concentration of other heavy metals; (3) pH; and (4) amount and strength of organic chelates and inorganic complex ion formers present in solution. Other suggested controls on the concentration of the heavy metals in soils and fresh waters are: (1) organic matter; (2) clays; (3) carbonates; and (4) precipitation as the discrete oxide or hydroxide. The available information on these controls is reviewed and found to be inadequate to explain the fixation of Co, Ni, Cu, and Zn. (Author)

SALT-WATER ENCROACHMENT IN THE SOUTH EDISTO RIVER ESTUARY, SOUTH CAROLINA,
U. S. Geological Survey, Water Resources Division, Washington, D. C.
T. Ray Cummings.
U S Geol Surv Water-Supply Pap 1586-I, 1968. 19 p, 12 fig, 2 tab, 11 ref.

Descriptors: *Encroachment, *Estuaries, *South Carolina, Tidal effects, Discharge (Water), Saline water intrusion, Water quality, Winds, Dissolved solids.
Identifiers: *South Edisto River, *Specific conductance.

A study of salt-water encroachment in the South Edisto River, South Carolina, found that chemical characteristics are altered to about 25 mi upstream from the mouth. Precise correlations of discharge, tide, and weather, the factors affecting distance of the salt-water encroachment, with specific chemical characteristics are not possible in the report area. Mean discharge, flow duration, high tide frequency, relation of specific conductance to discharge, frequency curves of specific conductance, relation of dissolved solids to conductance, frequency curves for dissolved solids and chlorides, and water temperatures, are presented graphically. Tables show maximum and minimum values of dissolved solids and the physical properties of water at 2 gaging stations. (Knapp-USGS)

DELAWARE COAST, BEACH EROSION CONTROL AND HURRICANE PROTECTION.
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, Senate Doc No 90, 110 p, 1968. 21 photo, 20 tab, 1 append, 1 suppl.

Descriptors: *Beach erosion, *Shore protection, *Flood control, *Landfills, *Coastal engineering, Hurricane, Delaware.
Identifiers: Delaware, Atlantic coastal area.

A beach erosion and hurricane protection study of beaches along the Delaware Coast found that all the public and private beaches have been damaged by erosion, and that improvements landward of the beaches are threatened. The quantity of sand supplied naturally to the beaches by littoral drift is insufficient to offset the loss from storms and high tides. Plans of improvement for individual localities, financed as small beach erosion control projects, consisting of initial placement of fill, periodic nourishment of beaches, construction of groins where required, and maintenance and replacement of existing structures, are economically justified only for Broadkill Beach, South Bowers, and Lewes. Beach erosion control for the entire Delaware Coast financed as a whole, consisting of fill, bulkheads, nourishment, placement of sand fences, and planting of dune grass is, however, economically justified by the benefits in prospect. The estimated first cost is $8,044,000, annual cost is $157,700, and the benefit-cost ratio is 1.4 for the northern reach and 1.6 for the southern reach. (Knapp-USGS)

MIXING OF THE CONGO RIVER WATERS WITH THE WATERS OF THE SOUTH ATLANTIC,
Institut geographique du Congo.
Jean Meulenbergh.
Academie Royale des Sciences d'Outre-Mer, Classe des Sciences Techniques, NS, 16-6, Brussels, 1968. 148 p, 55 fig, 4 tab, 28 ref. Trans by USGS.

Descriptors: *Estuarine environment, *Watersheds (Basins), *Aquatic environment, Fish migration, Tidal effects, Water temperature, Fish attractants.
Identifiers: *Water mixing, *Congo River, Africa, Oceanography.

As a contribution to knowledge of the fluviomarine zone of the Congo River, an analysis is presented based on hydrological data collected by electronic sounding and other equipment between 1959 and 1963. The fluviomarine water quality varies with changing river discharge (between 25,000-60,000 cu m/sec) and the nature of the marine water. Effects of tides, coastal currents, and wind action are discussed. Temperature and salinity observations are graphed. Contrary to general belief, the study shows that in this zone there is turbulent mixing of fresh and sea waters of different salinity and temperature. At about 20 m depth, river waters mix with cold salt waters of the submarine canyon. T-S diagrams indicate that at certain seasons, normal salinity occurs at depths between 20-25 m. The data are considered of interest to maritime fishing, because fish leave the too-warm waters of the Gulf of Guinea (24-30 deg C) that are low in salinity (33-34 parts per thousand), and lack plankton and other nutrients. Diffusion and mixing are reduced vertically by a thermocline at 30 m which is a zone preferred by fish. Bathythermograms indicate the zone does not mix with the Guinea water mass. (Llaverias-USGS)

BREVARD COUNTY, FLORIDA (BEACH EROSION CONTROL).
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 352, 74 p, 1968. 10 fig, 1 plate, 13 tab, 1 suppl, 1 append.

Descriptors: *Beach erosion, *Shore protection, *Coastal engineering, Dredging, Harbors, Jetties, Littoral drift, Florida.
Identifiers: Brevard County, Florida, Cape Canaveral, Cape Kennedy.

Investigation of beach erosion south of Canaveral Harbor, Florida, shows that the jetties and other harbor works are intercepting the southward littoral drift of sand and as a consequence erosion of the beaches of Brevard County is severe. Remedial measures proposed include development and protection of 2.8 miles of beach immediately south of Canaveral Harbor and at Indialantic and Melbourne Beach. Nourishment of the beach at the City of Cape Canaveral would be provided by a sand transfer plant which would restore the littoral drift now being intercepted by the harbor works. First costs are estimated to be $852,000 for the city of Cape Canaveral and $511,000 for Indialantic--Melborne Beach; estimated annual costs are $34,700 and $81,800 respectively. The plan is economically justified with benefitcost ratios of 5.9 for Cape Canaveral and 2.5 for Indialantic and Melbourne Beach. It is recommended that the Federal Installations at Cape Kennedy and Patrick Air Force Base also undertake remedial measures to be paid for by the Federal agencies involved. (Knapp-USGS)

RIVER CHANNEL BARS AND DUNES--THEORY OF KINEMATIC WAVES,
U. S. Geological Survey.
Walter B. Langbein, and Luna B. Leopold.
U S Geol Surv Prof Pap 422-L, pp L1-L20, 1968. 19 fig, 4 tab, 20 ref.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Sediment transport, *Sediment distribution, *Dunes, *Sand bars, Meanders, Model studies, Flumes.
Identifiers: *Kinematic waves.

A study of the movement of beads carried in moving water in a narrow flume, and of sand in a pipe or flume in dune movement shows that flux-concentration curves characteristic of kinematic wave movement can be constructed. From the kinematic point of view, concentration of particles in dunes and other wave bed forms results when particles in transport become sufficiently numerous or closely spaced to interact and reduce the effectiveness of the ambient water to move them. Field observations over a 5-yr period are reported in which individual rocks were painted for identification and placed at various spacings on the bed of an ephemeral stream in New Mexico, to study the effect of storm flows on rock movement. The data on about 14,000 rocks so observed show the effect of variable spacing which is quantitatively as well as qualitatively comparable to the spacing effect on small glass beads in a flume. Dunes and gravel bars may be considered kinematic waves caused by particle interaction, and certain of their properties can be related to the characteristics of the flux-concentration curve. THE PROBLEM OF THE PALEOKARSTIC DAMMAM LIMESTONE AQUIFER IN KUWAIT,
Food and Agriculture Organization of the United Nations, Rome, and Dept. of Water and Gas, Government of Kuwait.
David J. Burdon, and Abdullah Al-Sharhan.
J Hydrol, Vol 6, No 4, pp 385-404, Aug 1968. 20 p, 2 fig, 2 tab, 21 ref.

Descriptors: *Aquifers, *Karst, Limestones, Water yield, Water quality, Paleohydrology.
Identifiers: Kuwait, Paleokarst, Dammam Limestone, Imported water.

A preliminary study of the Dammam Limestone shows that the karstic zones developed in Upper Eocene and Oligocene time should yield more water of better quality than zones of lower permeability. The Kuwait City and Ahmadi municipal well fields yield 27 million cubic meters of poor-quality water (4,000 ppm TDS). Further groundwater development is planned. It may be possible to use the anisotropic aquifer for storage of imported water. The piezometric surface of the aquifer was mapped, the general stratigraphy of Kuwait is shown in a table, and a cross section shows the Karstic nature and problems of development of the Dammam Limestone. GROUND-WATER RESOURCES OF ACCOMACK AND NORTHAMPTON COUNTIES, VIRGINIA,
U. S. Geological Survey.
Allen Sinnott, and G. Chase, Tibbitts, Jr.
Virginia Dep of Conserv and Econ Develop, Div of Mineral Resources, Rep 9, 1968. 113 p, 7 fig, 4 plate, 8 tab, 25 ref.

Descriptors: *Groundwater, *Water resources, *Water wells, *Aquifers, *Virginia, Coastal plains, Water yield, Water quality.
Identifiers: *Accomack County, Virginia, *Northampton County, Virginia, Delmarva.

Groundwater resources of Accomack and Northampton counties, in the Virginia part of the Delmarva peninsula, were studied by the USGS and the Virginia Division of Mineral Resources. Mean annual temperature is 58 deg and the precipitation is 43 in. Thin surficial Pleistocene sands, and clays are underlain by Miocene deposits which supply most of the water for municipal and industrial uses. Chemical character of the deeper water suggests hydraulic connection with the artesian aquifers east of Chesapeake Bay. Domestic water is mainly from wells in the Pleistocene deposits. Larger wells are mainly in Miocene aquifers; one near Exmore yielded 746 gpm with 37 ft of drawdown, and one at Cape Charles yields 645 gpm. The water is good, moderately hard, and usually low in iron and fluoride. Deep Miocene wells yield water high in bicarbonate and fairly high in chloride. Withdrawal is not excessive anywhere and the supply is adequate for foreseeable needs. Well descriptions, aquifers, water levels, yields, and chemical analyses are tabulated. Maps, cross sections and a stratigraphic column show well location, geology, and stratigraphy. (Knapp-USGS)

CONTOUR FURROWING, PITTING, AND RIPPING ON RANGLANDS OF THE WESTERN UNITED STATES,
U. S. Geological Survey, Water Resources Div., Denver.
F. A. Branson, R. F. Miller, and I. S. McQueen.
J of Range Manage, Vol 19, No 4, pp 182-190, July 1966. 9 p, 12 fig, 25 ref.

Descriptors: *Mechanical equipment, Contour furrows, Ranges, *Grasslands, Crop response, Fine-textured soils, Vegetation, Precipitation intensity, Runoff, Altitude, Soil moisture, Moisture content, Salinity, Furrows, Reclamation states, Sediment control, Soil water movement, Halophytes.

During the growing season of 1964, the effects of mechanical treatment on rangelands administered by the Bureau of Land Management were measured in Montana, Wyoming, Colorado, Utah, New Mexico and Arizona. Variables evaluated in the study included kinds of mechanical treatments, soils, vegetation types, variation in precipitation, altitude, latitude and longitude. No well-defined relationship was found between annual precipitation and altitudes with respect to treatments. The purposes of mechanical land treatments were to reduce runoff, thereby increasing moisture storage for plant use, and to decrease sediment and water movement from treated sites. Salinity and pH did not appear related to treatment success. Medium- to medium-fine textured soils were the most suitable for mechanical treatment. The halophytic Nuttall saltbush responded more favorably to contour furrowing than did any other type sampled. Of the seven kinds of mechanical treatments, the contour furrowing and broadbase furrowing were the most effective. Treatment of winter fat resulted in a decrease in perennial grass production. AN EVALUATION OF FIVE APPLICATION METHODS FOR APPLYING EVAPORATION SUPPRESSANTS TO THE SURFACE OF SMALL WATER STORAGES,
Manitoba Univ., Agricultural Engineering Dept., Winnipeg.
H. M. Lapp.
Can Agr Eng, Vol 10, No 1, pp 17-22, May 1968. 6 p, 6 fig, 16 ref.

Descriptors: Emulsions, *Evaporation control, Hexadecanol, Octadecanol, *Monomolecular films, *Reservoir evaporation, Precipitation, *Application methods, Rates of application, Alcohols, Semiarid climates, Water storage, *Retardants, Wind velocity.

In semi arid regions, potential evaporation losses frequently exceed annual precipitation values. Seven methods were listed that could be employed to reduce evaporation from water storages. A review of evaporation suppression and the physical properties of monolayer materials was given. The five application methods evaluated were: manual powder, continuous emulsion, continuous solution, intermittent powder and continuous powder. The superior evaporation suppressant to date appears to be a mixture of approximately equal quantities of hexadecanol and octadecanol. A methyl alcohol based solution of about 5% concentration and a dry fine powder are suitable forms of evaporation suppressant for application to a water surface. An evaporation suppressant should be generated continuously from the upwind shore and at rates proportional to wind speeds to form an efficient monolayer for evaporation suppression. A continuous application of dry fine powder from a dispenser located on the upwind shore was judged to be the most practical and efficient method of applying an evaporation suppressant to small water storages. SIMULATION OF GREAT LAKES BASIN WATER SUPPLIES,
U. S. Lake Survey, Detroit and Inland Waters Branch, Ottawa, Canada.
Edmond Megerian and Ralph L. Pentland.
Water Resources Research, Vol 4, No 1, pp 11-17, February 1968. 7 p, 3 fig, 3 tab, 6 ref.

Descriptors: *Model studies, *Water supply, *Great Lakes, Mathematical models, Testing, Persistence.
Identifiers: *Net basin supply, Simulation studies, Two-station model, Multivariate model, Great Lakes Basin, Autocorrelation test.

The basic concept utilized in the simulation study is to statistically evaluate the recorded supplies in order to isolate the two components assumed to constitute the basin water supply: (1) that portion of the supply that is considered random, owing to chance interaction of unpredictable meteorological elements, and (2) that portion of the supply that is the result of the persistance due to natural storage in the lakes, soil, bedrock, and snow over the drainage basin. In this study, consideration was also given to the relationship between supplies in neighboring basins. These factors were used to formulate mathematical models for simulation of supplies to all of the Great Lakes simultaneously. Extensive statistical tests have been used to ensure that the statistical parameters and the time series characteristics of the simulated data resemble those of the recorded data. (Seneca-Rutgers)

CLIMATE AND STREAMFLOW OF PUERTO RICO,
U. S. Geological Survey, San Juan, Puerto Rico, Water Resources Division.
E. V. Giusti, and M. A. Lopez.
Caribbean J Sci, Vol 7, No 3-4, pp 87-93, Sept-Dec 1967. 7 p, 5 fig, 1 tab, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Puerto Rico, Streamflow, Climatology, Synoptic analysis.
Identifiers: Thornthwaite's method, Climatic index.

The presently available data on streamflow, runoff rainfall, and temperature of Puerto Rico are evaluated, although the period of record is very short, with a view to contributing to the knowledge of hydrology of tropical islands. The average annual streamflow in Puerto Rico is 56% of the annual rainfall, or 15% more than in the Eastern Piedmont of the U S where it is 30%. Climate is assumed to be responsible for this difference as well as for the differences of the flows of Puerto Rican streams which vary from 15 to 85% of the annual rainfall. Variations in the climate of Puerto Rico are shown by Thornthwaite's climatic index on a map of the Island, and the variations of the streamflow to rainfall ratios of Puerto Rican streams are shown to be related to Thornthwaite's climatic index. RECESSION CHARACTERISTICS OF IOWA STREAMS,
Iowa Univ., Iowa City.
J. W. Howe.
Iowa State Water Resources Res Inst Bull 43, Iowa Univ, 32 p, 1968. 12 fig, 2 tab.

Descriptors: *Recession curves, *Streamflow forecasting, Iowa, Low flow, Surface-groundwater relationships.

The behavior of Iowa streams in low-water periods during the crop-growing season, May to Sept inclusive, was determined. The flow records in all such periods to 10 days or more in length were analyzed to determine recession constants. The results are shown on a map of the state and indicate a considerable uniformity of behavior during each of the summer months. The flow at the beginning of the periods was related to the area and soil permeability of the drainage basin and to the antecedent temperature and precipitation by means of correlation techniques. Data were obtained from the USGS, US Weather Bureau, and the US Soil Conservation Service. The lower parts of recession hydrographs with steady declines of at least 10 days were plotted using logarithmic discharge and linear time scales. The best straight line through the plotted points was constructed, breaks in slope were assumed to mark the beginning of groundwater flow, and recession constants were calculated. The recession constants were plotted on maps showing station locations. Observed and predicted discharges were plotted for May through Sept. Values of the recession constants and a summary of stations, data, and results are tabulated. (Knapp-USGS)
W69-00262

DISTRICT CONTROL OF WATER RESOURCES,
Detroit Univ Law School.
T. E. Lauer.
U of Detroit L J, Vol 37, No 1, pp 28-75, Oct 1959. 47 p, 344 ref.

Descriptors: *Water resources development, *Administration, *Water districts, Drainage districts, Levees, Flood control, Water policy, Administrative agencies, *Great Lakes region, State governments, Water management (Applied), Water supply.
Identifiers: Multiple-purpose districts, Single-purpose districts.

Water use law is not the only law directly affecting water resources-- 'water development law' is a second major area which is directed at group or community protection, and is based on cooperation instead of conflict. This article is concerned with water districts, a branch of water development law, with detailed emphasis on the developments in the Great Lakes States. Single-purpose districts are often used because needs arise and are recognized singularly. Drainage districts are usually established to drain potential farmland, and their powers were severely limited. Flood control, levee, and river improvement districts are usually established to allow participation in federally financed programs. Water supply districts, pollution control and sewage disposal districts, and various miscellaneous single-purpose districts are considered in detail. The modern tendency is toward multiple-purpose districts, which provide various economies. Conservancy and watershed districts and soil conservation districts are discussed, detailing Great Lakes States provisions. Advantages such as local control, and disadvantages such as financing problems are discussed in regard to districts. Problems involved in creating districts (i.e. geographical boundaries and scope of powers) are considered.

APPROACHES TO WATER RESOURCE DEVELOPMENT IN CENTRAL AND SOUTHERN FLORIDA, 1845-1947,
John M. DeGrove.
Florida Univ., Gainesville, 1958. 53 p.

Descriptors: *Federal government, *State government, *Land reclamation, Coordination, *Florida, Water resource development, Crops, Multiple-purpose projects, Legislation, Drainage practices, Navigation, Project planning, Flood control, Optimum development plans, Political aspects, Administration, Drainage districts, Soil properties, Crops.

This study consists of a selective survey of federal, state, local and private efforts to solve the water control problem of central and southern Florida from 1845 to 1947. It is selective because the study does not purport to be a general history of the subject during this period. Within a broad historical framework, specific kinds of problems are selected for analysis. These problems are concentrated within the general problem areas of administration, economics, and policy. The aim will be to attempt to discover whether experience in the evolution of the Florida project is useful in better understanding the general nature of the problems in the areas to be concentrated on. It is also hoped that by better understanding how present patterns in the administration, finance, and federal-state-local fields have evolved, it will be possible to face more realistically the task of making improvements in each of the areas treated.

3C. Use of Water of Impaired Quality

DUHON V BUCKLEY (SALINE WATER INTRUSION).

161 So 2d 301-307 (La 1964).

Descriptors: Louisiana, Judicial decisions, Salinity, *Rice farms, Oil wells, *Saline water-freshwater interfaces, Brine disposal, *Desalination, *Water pollution, Damages.

This was an action by four rice farmers against several owners of an oil well for damage to their rice fields, because the defendants had permitted salt water from their well to flow into the source from which plaintiffs pumped water for their rice fields. Defendants denied that their negligence caused any significant change in the salinity of the water source, and even if it had, that plaintiffs were contributorily negligent because they did not check for salt content before filling the rice fields. It was held that defendants' mine was the only possible source of salt water in the area, that the water in the rice fields and the water source was unusable for rice growing, and that plaintiffs did not have a duty to check for salinity before pumping water onto their fields. SOURCES OF SALINE WATER IN THE UPPER BRAZOS RIVER BASIN, TEXAS,
U. S. Geological Survey.
Jack Rawson, M. W. Flugrath, and Leon S. Hughes.

US Geol Surv Progr Rep to June 1967, Mar 1968. 163 p, 2 fig, 8 tab, 23 ref.

Descriptors: *Saline water, *Water pollution sources, *Texas, Data collections, Water quality, Discharge (Water), Water wells, Oil fields.
Identifiers: Brazos River Basin, Texas.

Sources of salt in Brazos River, west-central Texas, were studied to determine the best means of alleviating saline-water problems in connection with developing the basin's water resources. The Brazos above Possum Kingdom Reservoir is too saline for most uses; in the reservoir the salinity is usually over 1,200 ppm. The upper Brazos contributes only 18% of the total river flow, but about 55% of TDS, 85% of the chloride, and 75% of the sulfate. Poor water quality is due principally to inflow of natural brine, solution of calcium sulfate from soil and rocks, and pollution by oil field brine. Salt yields, chemical quality records, chemical analyses of stream water, records of wells and streams, annual discharge summaries, annual water quality summaries, quality of Possum Kingdom Reservoir water, and hypothetical reservoir water quality based on partial control of natural salinity, are tabulated. The major salt-contributing areas are described in detail. One stream, Salt Croton Creek, contributes about 27% of the dissolved solids, 42% of the chloride, and less than 5% of the sulfate to Possum Kingdom Reservoir. (Knapp-USGS)

WATER PROBLEMS IN THE SPRINGFIELD-HOLYOKE AREA, MASSACHUSETTS - A LAYMAN'S LOOK AT WATER IN THE METROPOLITAN AREA,
U S Geological Survey.
J. C. Kammerer, and H. L. Baldwin.
Geological Survey Water-Supply Paper 1670 pp 30-68, 1963. 39 p. 5 fig, 10 photo, 3 dwg, 4 tab, 26 ref, 1 append.

Descriptors: Rivers, Groundwater, Hardness (Water), Iron, *Water pollution control, *Water users, Interstate commissions, Water pollution effects, Water pollution sources, Industrial wastes, Sewage treatment, Pre-treatment (Water), Sewage treatment, *Water rates, *Water requirements, *Recreation, Recirculated water, Public health.

Mineral content of area water, with the exception of iron, is not a problem. Sanitary sewage and industrial wastes cause pollution, and the larger streams are often polluted. Water is classified according to its sanitary condition. The three area rivers are condition 'D', or, suitable for transporting wastes without nuisance. Polluted water is fit for some industrial purposes. Some area cities do not treat their sewage. Ground water quality varies. The pollution-control program of Massachusetts aims at primary treatment of all wastes and sewages. There are 420,000 plus people and about 900 manufacturing industries in the area. Seven public water systems provide an average of 60 million gallons a day from reservoirs and wells. Water costs are about average. The flow of the Connecticut River is regulated by reservoirs and hydroelectric power plants. Recreational use is increasing. Total area water use amounts to 400 million gallons a day. One way to save water is to recirculate it, another is to build multiple-purpose reservoirs.

INTERACTION OF SALINE WATER IRRIGATION AND NITROGEN FERTILIZATION ON CORN PRODUCTION IN CALCAREOUS SOILS,
Desert Inst., Egypt Soils Dept.
M. A. Abdel Salam, and S. A. el Nour.
J Soil Sci (UAR), Vol 5, No 2, pp 120-133, 1965. 13 p, 7 tab.

Descriptors: *Saline water, *Irrigation water, *Corn (Field), *Calcareous soils, Fertilizers, *Nitrogen, Plant growth, Crop production, Salinity, Adsorption, Lysimeters, Mineralogy, Soil chemistry, Ions, Sodium, Osmotic pressure.
Identifiers: United Arab Republic, Ionic composition, Fresh weight, Dry weight.

Variation in yield and mineral composition of corn grown in calcareous loamy soil, irrigated with solutions of varying total and relative salt levels and fertilized with gradual amounts of nitrogen was studied in the United Arab Republic. Salinity levels of 1, 2, and 3 atm of osmotic pressure; sodium adsorption ratios of 2.7, 19.3, and 51.2 and nitrogen levels of 50, 150, and 250 kilograms of ammonium nitrate were utilized. Significant differences were obtained in yield and mineral composition for both salinity and the sodium adsorption ratio. Adverse effects of increased salinity on crop yield decreased progressively with the nitrogen level applied. Maximum decrease in yield was associated with the highest ESP values where solutions of 3 atm osmotic pressure and 51.2 SAR were added. (Affleck-Ariz)

FUTURE QUANTITY AND QUALITY OF COLORADO RIVER WATER,
Leeds, Hill and Jewett, Inc, San Francisco.
Raymond A. Hill.
J Irrig and Drainage Div (ASCE), Vol 91, No IR 1, Proc Paper 4244, pp 17-30, March 1965. 14 p, 15 tab.

Descriptors: *Colorado River, *Water quality, *Salts, River flow, Water supply, Water chemistry, *Withdrawal, Colorado River Compact, Mexican Water Treaty, Salt balance, Consumptive use, *River forecasting, Water demand.
Identifiers: *Salt burden.

The Colorado River water used in California, Arizona and Mexico currently (1964) contains approximately 0.9 tons of salt per acre foot. It was predicted that progressive depletions in the natural flow of the Colorado River by upstream developments will have little effect on the total salt burden but a pronounced effect in the future on the unit concentrated of salts in the river water available for use. It was concluded that the water supply available in the Colorado River for use in the Lower Basin and in Mexico will shrink during the next 30 years from an average of 11,800,000 to approximately 8,000,000 acre feet per year. The chemical quality of the waters of the Colorado River was expected to fall far below present accepted standards. (Affleck-Ariz)

PROGRESS IN WASTE WATER RE-USE IN SOUTHERN CALIFORNIA,
Los Angeles County Sanitation Districts.
John D. Parkhurst.
J Irrig and Drainage Div (ASCE), Vol 91, No IR 1, Proc Paper 4253, pp 79-91, March 1965. 13 p, 3 fig, 1 tab.

Descriptors: California, *Water reuse, *Waste water (Pollution), Water supply, *Water quality, Industrial wastes, *Reclaimed water, Irrigation water, Recharge, Sanitary engineering, Water resources development, Sewage treatment, Economic feasibility, Alkylbenzene sulfonates, Public health, Domestic wastes, Detergents.

Water re-use in the Los Angeles area was planned to furnish a supplemental water supply in a water deficient area. It was found that suitability of waste water for re-use depended on the water supply quality and the character of industrial waste pollutants. Detailed planning was necessary for effective water re-use. Plans for water re-use developments in the Los Angeles area by the Sanitation Districts was presented. It was found that reclaimed water could be used for such purposes as industrial use, irrigation water for forage crops, cotton, nursery stock, field crops, parks, golf courses, and recharging underground water basins. THE EFFECT OF SALINE IRRIGATION WATER WITH DIFFERENT SODIUM AND CALCIUM CONCENTRATIONS ON SOME SOIL PROPERTIES,
Ain Shams Univ., Egypt, Soils Dept.
H. Hamdi, S. Youssef, and M. M. El Mansey.
J Soil Sci (UAR), Vol 6, No 1, pp 63-71, 1966. 8 p, 5 tab.

Descriptors: *Saline water, Irrigation effects, *Irrigation water, Sodium, Calcium, *Soil chemical properties, *Cation exchange, *Chemical analysis.
Identifiers: United Arab Republic, *Na : Ca ratios.

An investigation was conducted to determine the effect of using irrigation waters of varying total salt concentrations with different Na:Ca ratios on a clay loam and a sandy soil in the United Arab Republic. Irrigation waters used on the pots contained total salt concentrations of 1,000, 2,000 and 3,000 ppm and Na:Ca ratios of 2:1, 3:1 and 4:1. Results showed that total soluble salts, soluble sodium, calcium and chloride increased in the 1:5 soil water extract with both soils. Soluble sodium increased with higher Na:Ca ratios while soluble Ca decreased and Cl remained constant in both soils. (Affleck-Ariz)
W69-00373

THE EFFECT OF USING DIFFERENT CONCENTRATIONS OF SALINE WATER CONTAINING DIFFERENT Na : Ca RATIOS ON THE GROWTH AND CHEMICAL COMPOSITION OF ALFALFA,
Ain Shams Univ., Egypt. Soils Dept.
H. Hamdi, S. Youssef, and M. M. Elmansey.
J Soil Sci (UAR), Vol 6, No 2, pp 131-143, 1966.

Descriptors: *Saline water, *Irrigation water, Absorption, Plant growth, *Alfalfa, Crop production, *Ions, Nutrients.
Identifiers: United Arab Republic, Ionic concentration, Dry weight, Na:Ca ratios.

The effect of irrigation waters with varying Na:Ca ratios upon the growth and nutrient uptake of alfalfa was studied in the United Arab Republic. Two soils, one a clay loamy type and the other a sandy type, were utilized. Pots sown with alfalfa were treated with irrigation water containing total salt concentrations of 1,000, 2,000 and 3,000 ppm and three different ratios of Na:Ca namely 2:1, 3:1 and 4:1. The control group received distilled water. Alfalfa yield was decreased as the salt concentration increased and the plants showed an increase in Na super +, Ca super ++, and Cl super - contents but a decrease in K super +. Increase of salt concentration also resulted in decreased Ca super ++, Na super +, and K super + uptake and an increased Cl super - uptake. As the Na:Ca ratio was increased plants showed an increase in Na while Ca super ++ and Cl super - contents remained constant. (Affleck-Ariz)

INTERACTION OF SALINE WATER IRRIGATION AND PHOSPHOROUS FERTILIZATION ON CROP PRODUCTION,
Desert Inst., Soils Dept., Egypt.
M. A. Abdel Salam, and A. Z. Osman.
J Soil Sci (UAR), Vol 5, No 2, pp 75-87, 1965. 13 p, 6 tab.

Descriptors: *Irrigation water, *Saline water, *Fertilizers, Alfalfa, Barley, Sodium, Adsorption, *Crop production, Ions, Soil analysis, *Mineralogy, Salinity.

The effect of interaction between phosphorous fertilization and saline water irrigation on the growth and mineral composition of alfalfa and barley was studied in the United Arab Republic. A calcareous loamy soil and a clay soil were treated with tagged (P super 32) superphosphate fertilizer and utilized in earthenware pots then sown with alfalfa and barley. They were irrigated with solutions of salinity levels of 1, 2, and 3 atm osmotic pressure and sodium adsorption ratios of 2.7, 19.3, and 51.2. Differences in yield and mineral composition were caused by both salinity and sodium adsorption ratio. The salinity level in irrigation waters adversely affected the percentage of phosphorous derived from fertilizer. (Affleck-Ariz)

3E. Conservation in Industry

CHAUTAUQUA CO FED'N OF SPORTSMENS CLUB V CAFLISCH (MILL DAMS).
State of New York.

15 App Div 2d 260; 222 N Y S 2d 835-840 (1962).

Descriptors: Dam, *Mill dams, Electric power, Ponding, Conservation, *Wildlife conservation, Habitat improvement, Impounded waters, Water level fluctuations, Water law, Water levels, Flooding, Fish conservation, New York, Water policy, Running waters, Surface water, Natural flow.

The issue on appeal was whether the plaintiff had the right, by grant and by prescription, to raise and maintain the waters of Jaquins Pond for any lawful purpose or use, including conservation purposes, to a normal level. The court considered what rights the plaintiff acquired by the terms of the conveyances from its grantor and through him from his predecessors in title. No document that conveyed the property in question conveyed any right to use the waters impounded by the dam except for the purpose, express or implied, of operating machinery. The plaintiff conceded that the use of the impounded waters had nothing to do with the operation of machinery, but is solely for conservation purposes. The court stated that the express and unambigous language of the grant to plaintiff revealed an intention to limit the use of the water impounded by the dam to the operation of machinery and it must be given effect. The court reversed the trial court and held that the uplands may not be flooded for conservation purposes under the terms of such a grant. (R. Smith-Fla)

IRRIGATION REGIME OF SOILS REQUIRING RECLAMATION,
Academy of Sciences, USSR, V V Dokuchayev Institute of Soil Science.
I. P. Komyagin.
Pochvovedeniye, No 11, pp 66-73, Nov 1967. 7 p, 2 tab, 22 ref. Soviet Soil Science, Transl by Scripta Technica, Inc, pp 1488-1494, Aug 1968.

Descriptors: *Irrigation, *Crop production, *Land reclamation, Soil structure, Precipitation intensity, Translations.
Identifiers: *USSR, Soil compaction, Irrigation regime.

The influence of irrigation regimes on soils in relation to productivity in the USSR is briefly discussed. It was observed that when the amount of precipitation was large and soil compaction heavy, as in the Izobil'noye region, the equilibrium compactness was considerably less, and vice versa. Judgements of the effects of different methods of irrigation on the soil immediately after water is applied cannot be adequately evaluated. For example, soil structure is damaged to a greater extent by flood irrigation than by sprinkling or by furrow irrigation. Success in improvement of soils depends on the proper selection of irrigation regime. Experiments involving increased depth of soil wetting by irrigation have resulted in increased yields of crops. This is demonstrated in the southern Ukraine where 4 irrigations during the growing season resulted in marked increase in yields of tomatoes and other crops. (Llaverias-USGS)

EFFECT OF STRAW MULCH RATES ON SOIL WATER STORAGE DURING SUMMER FALLOW IN THE GREAT PLAINS,
B. W. Greb, D. E. Smika, and A. L. Black.
Soil Sci Soc Amer Proc, Vol 31, No 4, pp 556-559, July-August 1967. 4 p, 1 fig, 5 tab, 17 ref.

Descriptors: Arid climates, *Stubble mulching, Moisture availability, Precipitation, *Soil moisture, Fallowing, Wheat, *Water storage, Mulching, *Great Plains, Evaporation control, Soil profiles.
Identifiers: *Straw.

The effect of defined rates of straw mulch on soil water storage fallow was studied. Soil water storage data from three experiments which were being conducted within the Great Plains area utilizing various known quantities of initial rates of straw were presented. Each experiment included an alternate crop and fallow block of plots utilizing winter wheat (Triticum aestivum L) as a source of straw. The length of summer fallow averaged 14 months. In all cases, initial available soil water was relatively low at wheat harvest (beginning of fallow). Soil water differences were evident at all locations by early spring. Net gains of soil water at the end of fallow as credited to increasing quantities of straw mulches varied from 1.0 to 4.3 cm at Sidney, Montana, 2.1 to 4.1 cm at Akron, Colorado and 1.3 to 3.3 cm at North Platte, Nebraska. More than 70% of the net gains in soil water under heavier amount of mulch was found below the surface 61 cm of the soil profile at all locations, thereby minimizing potential evaporation losses. Since wheat is grown in arid climates, the principles and practices studied could be applied to this particular climate. (Blecker-Ariz)

STUBBLE MULCH INCREASES AMOUNT OF MOISTURE STORED IN SOIL,
South Dakota State Univ.
Earl Adams.
Crops and Soils Mag, Vol 20, No 7, pp 30, April-May 1968. 1 p.

Descriptors: *Stubble mulching, Moisture availability, Wind erosion, *Soil erosion, Precipitation, Evaporation, *Soil moisture, Fallowing, Topsoil, Field capacity, Water storage, Mulching.

Stubble mulching is a good way to reduce wind and water erosion on grain fields. Stubble mulched fields may store as much as 30% more moisture for the next crop in areas where annual precipitation is between 12-13 inches in Montana. Data indicated that the heavier the mulch, the less the surface evaporation and the deeper the moisture penetrates the soil profile. The total soil moisture gain for the 21 months in which the land was in fallow ranged from 2.9 inches for bare fallow up to 4.3 inches for the heaviest mulch. An important side effect of the mulch treatments is the amount of topsoil saved that might have otherwise been lost through soil erosion by wind and water. (Blecker-Ariz)

STABILIZING AND MANAGING MALLEE SANDHILLS,
Wanbi Research Centre, Australia.
P. D. Guerin.
J of Agr of S Australia, Vol 69, No 8, pp 305-309, March 1966. 5 p, 5 photo.

Descriptors: *Dunes, Wind erosion, *Soil stabilization, Sands, *Arid climates, *Vegetation establishment.

Treatment of the long sand ridges that occur throughout the sandy mallee farming areas is an important aspect of farm management in South Australia. The basic principle in treating vulnerable sandhills in arid climates is that the plant cover must be both established and maintained. The two classes of sandhills are the low to medium sandhills which, when properly stabilized, may be cropped and managed with the remainder of the paddock, and secondly the sandhills with large, steep ridges which should be fenced out. Cereal rye has proved to be the most outstanding vegetation cover for initial stabilization of sand drift. The most satisfactory species for permanent cover on sandhills are lucerne and perennial veldt grass. (Blecker-Ariz)

Irrigation Research Lab., Griffith, New South Wales, Australia.
E. R. Hoare.
XVII Int Hort Congr Proc, Vol 2, pp 105-112, 1967. 8 p, 1 fig, 1 tab.

Descriptors: Semiarid climates, Trees, *Fruit crops, *Solar radiation, Humidity, Soil moisture, Crop production, Water utilization, Salinity, *Irrigation practices, Water loss, *Orchards, Soil-water-plant relationships, *Crop response, Moisture stress.
Identifiers: *Penman's formula.

The semi arid areas of the world have been ideally suited to the growing of tree fruit due to higher sunlight intensity, suitable soils and low humidity. Prior to the 1940's, the approach to water usage by plants was botanical in concept. Penman's formula was discussed in terms of water losses that would occur in an orchard. The interaction of soil and plant with respect to soil moisture content and crop yield as related to the plant's water stress were discussed. If an orchard was planted in some remote arid area of the world, with the data given it is possible to calculate within 20% the full water requirements of that crop. The effects of salinity on the amount and frequence of irrigation were discussed. (Blecker-Ariz)

Identifiers: Economics, *Irrigation.

This paper examines the trends in irrigation. Even though there has been rapid expansion of irrigation, physical potentials for further development exist. The amount of irrigable lands in the Great Plains States is related to the cropland harvested. Studies suggest that there may be ten million acres available for irrigation for which there are reasonable prospects of supplying water. The development of this potential irrigable acreage should be done by public agencies. The public interest will not be satisfied solely by the development of irrigable acreage since demands from non-agricultural uses of water exists, and these demands will increase in the future. Therefore, the development of water resources for irrigation purposes will have to be judged in relation to other beneficial uses. (Grossman-Rutgers)

MANAGEMENT: A KEY TO IRRIGATION EFFICIENCY,
Dep of Agriculture, Phoenix, Arizona, Agricultural Research Service.
Leonard J. Erie.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR3, Pap 6107, pp 285-293, Sept 1968. 9 p, 4 tab, 2 fig, 10 ref.

Descriptors: *Water management (Applied), *Irrigation practices, *Water consumption (Plants), *Water loss, Evapotranspiration, Water utilization, Soil-water-plant relationship, Conservation.
Identifiers: *Irrigation efficiency, Crop irrigation.

Water consumption and efficiency of crop irrigation are discussed with relation to management. Water losses that occur in transporting from sources to ultimate irrigation sites are described, and some unavoidable water losses in management procedure are identified. Comparisons are made between various water uses, particularly those in industry and agriculture, and consumptive use data are discussed relative to conservation. Because irrigated agriculture accounts for 80%, or more, of all water consumed in the U S, the greatest opportunity for water conservation exists in good irrigation management. About 60% of the water withdrawn for irrigation is lost through evapotranspiration, and another large percentage is not otherwise beneficially used by plants. Inefficient application occurs because of lack of knowledge about soils, root systems, and consumptive use estimates by the manager. (Lang-USGS)

STABLE ALKANOL DISPERSION TO REDUCE EVAPORATION,
Dept. of Agriculture, Phoenix, Arizona, Water Conservation Lab.
Gary W. Frazier, and Lloyd E. Myers.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5849, pp 79-89, Mar 1968. 11 p, 3 fig, 2 tab, 14 ref.

Descriptors: *Evaporation control, *Alcohols, *Monomolecular films, *Surfactants, *Dispersion, Suspension, Solvents, Hexadecanol, Octadecanol.
Identifiers: Alkanols.

Highly stable sol- or gel-type dispersions of long-chain alkanols in water have been prepared and shown to be more effective than powdered alkanol in reducing evaporation from water surfaces. Surfactants used to prepare the dispersions are algicides and bactericides. Dispersion samples have shown no separation or deterioration after 5 yr storage under nonsterile condit ons. Concentrated dispersions can be prepared for shipment or storage and can be diluted with water containing up to 1,700 ppm soluble salts to make stable, low-viscosity dispersions for application with simple drip-type applicators. Film release rates and film pressures from dispersions exceed those from powder. Fifty pounds of powdered alkanol per acre per month r duced evaporation from outdoor tanks by 15% under adverse testing conditions. Under the same conditions only 10 lb of dispersed alkanol per acre per month reduced evaporation by 28%. (Author)

CONSUMPTIVE USE DERIVED FROM EVAPORATION PAN DATA,
USAID, Bogota, Columbia.
George H. Hargreaves.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5863, pp 97-105, Mar 1968. 9 p, 5 tab, 10 ref.

Descriptors: *Evapotranspiration, *Evaporation, *Consumptive use, *Climatic data, Irrigation programs, Rainfall, Evaporation pans.
Identifiers: Irrigation requirements, Evapotranspiration calculations.

Evapotranspiration measurements or computations provide basic information for the computation of irrigation requirements. Unfortunately, in underdeveloped or developing countries both evapotranspiration and weather data are usually of limited availability and for some proposed project areas nonexistent. Formulas and methods are required by engineers working on design and development of irrigation. These must permit the evaluation of needs and requirements for irrigation with an absolute minimum of data. Formulas are given for computing evaporation from climate data. Ratios of evapotranspiration to Class A pan evaporation are given for a large number of crops. Crops are grouped together or assigned general classifications whenever possible. Consumptive use coefficients converting evaporation to evapotranspiration are given by 10% increments of the crop growing season or vegetative cycle. A method of computing utilizable rainfall is presented and a formula is given for converting evapotranspiration to irrigation requirements. Irrigation requirements may be computed with several levels of data availability if temperature and rainfall measurements at the disposal of the engineer constitute the minimum of data required. WATER RIGHTS IN LOUISIANA,
Louisiana Law Review, Baton Rouge.
Jerry G. Jones.
La L Rev, Vol 16, No 3, pp 500-511, Apr 1956. 12 p, 49 ref.

Descriptors: Louisiana, Civil law, Water law, Water rights, Administrative agencies, State jurisdiction, Irrigation, Legislation.

Article 661 of the Civil Code, a typical expression of riparian doctrine, allows water usage only to those whose land abuts a stream. This basic legislation has been supplanted in areas where irrigation is controlled by administrative agencies. The enactment of R S 9:1101 declaring all waters to be the property of the State of Louisiana with the privilege of use by everyone further complicates the picture. If 661 is construed as unaffected by this legislation, an application of the general rules of servitude still yield many inequitable results, e g prohibition against riparian owner's use of water to serve non-riparian lands ajoining his riparian estate, but which have been purchased subsequent to the initial exercise of the servitude. Comprehensive legislation is needed to eliminate present doubt and conflict.

PROBLEMS OF FEDERALISM IN RECLAMATION LAW,
Colorado Univ. Law Review, Boulder.
Joseph L. Sax.
U Colo L Rev, Vol 37, No 1, pp 49-84, Fall 1964. 36 p, 157 ref.

Descriptors: *Federal Reclamation Law, *Federal-state water rights conflicts, Recreation, United States, State jurisdiction, *Compensation, Water reuse, States, Water policy, Reclamation, Irrigation, *Water allocation (Policy), Competing uses, Judicial decisions.
Identifiers: Federal Farm Policy, Surplus Crops.

The problems raised here center on Section 8 of Reclamation Act of 1902. This section delineates the rights reserved to the states where a Federal reclamation program is in force. Section 8 was originally interpreted to place state law above federal law whenever a conflict occurred. Recent cases indicate by dicta that the section now should be read so as to give state law priority only in situations concerning compensation for the loss of private property rights. Brief attention is paid to various legislation such as the Boulder Canyon Project Act, the Warren Act, the Reclamation Extension Act, and the Fryingpan-Arkansas Project law. Extensive analysis of the legislative history of the Reclamation Act is provided. The role of the Dept. of Interior in the area of recreation in water areas is discussed, with a conclusion that it will play a quite active role both in policy planning and administration. The relationship between the Reclamation Acts and Federal Farm policy is discussed with the conclusion being that Congress intended to utilize the reclamation laws to promote farm policy.

THE IRRIGATION DEMAND PHASE OF THE WATER SUPPLY AND DEMAND PROJECT (SECTION I: IMPROVING THE DESIGN OF ECONOMIC IRRIGATION SYSTEM - CROP RESPONSE),
Cornell University, Ithaca, N. Y., Agricultural Engineering Dept.
Gilbert S. Levine, J. Kampen, and I. Seginer.
OWRR Project No. A-001-NY, Technical Report No. 14, Cornell Water Resources and Marine Sciences Center, September 1968. 21 p, 6 fig, 7 tab.

Descriptors: Irrigation design, *Soil-water-plant relationships, *Evapotranspiration, *Crop response, Potatoes, Forage mixtures, Vegetable crops.

The yield responses of 8 vegetable crops, potatoes, and a variety of forages to additions of water were determined from past research in 5 Northeastern U.S. states. A relatively simple analysis and interpretation scheme revealed some generalizations: (1) for most vegetables there is a positive correlation between yield and water added; (2) the rate of yield response decreases when the water added is excessive, and may become negative; (3) this break point is approximately 13 in. for short season crops, 20 in. for potaotes and 20 to 22 in. for forages. Yield response of forages is between 0 and 500 lbs per inch of water used. (Levine-Cornell)

THE USE OF WATER BY COTTON CROPS IN ABYAN, SOUTH ARABIA,
Empire Cotton Growing Corp., Namulonge, Uganda.
D. A. Rijks.
J Applied Ecol, Vol 2, No 2, pp 317-343, Nov 1965. 27 p, 13 fig, 5 tab, 28 ref.

Descriptors: *Evaporation, *Cotton, Irrigation practices, *Rates of application, Water balance, Soil moisture, *Moisture content, *Energy budget, Temperature, Humidity, Crop production, Soil physical properties, Soil profiles, Meteorological data, Water utilization.
Identifiers: South Arabia, *Energy balance.

The object of a study conducted in South Arabia was to estimate by two methods, the actual evaporation from cotton crops grown under four different rates of irrigation. Evaporation was estimated from water balance studies, which took into account rainfall, irrigation and changes in soil water content. A second estimate was obtained by combing measurements of the energy balance over cotton with the temperature and humidity profiles in and above the crop. The four rates of irrigation, applied before sowing were 15, 45, 60 and 90 cm of water which resulted in the crops using 14, 34, 46 and 67 cm of water respectively. A relation between the decrease in yield and time of onset of water strain was presented. It was concluded that the most efficient use of water resulted when irrigation rates were adjusted to provide 50 cm of available water. (Affleck-Ariz)

INFLUENCE OF SOIL TEXTURE AND RAINFALL ON THE RESPONSE OF COTTON TO MOISTURE REGIME,
Lower Rio Grande Valley Research and Extension Center, U. S. Dept. of Agriculture, Weslaco, Texas.
C. J. Gerard, and L. N. Namken.
Agron J, Vol 58, pp 39-42, Jan-Feb 1966. 4 p, 5 fig, 3 tab.

Descriptors: *Soil texture, Rainfall, Crop response, *Cotton, Root distribution, *Soil moisture, Texas, Rates of application, Irrigation water, Arid lands, *Soil physical properties, Fine-textured soils, *Crop production.
Identifiers: Medium-textures soils, *Moisture regime.

A paper was presented which discussed the influence of soil texture and related rooting characteristics and of rainfall on the response of cotton to different soil moisture regimes in the Lower Rio Grande Valley of Texas. Cotton on medium textured soils developed an extensive root which was able to extract water to depths of 4 to 5 feet, while on fine-textured soils cotton was only able to extract water to 2 feet. On medium-textured soils cotton needed only 1 or 2 irrigations to produce satisfactory yields. It was found that cotton on fine-textured soils needed to be irrigated every 10 to 15 days starting at the first bloom. This study will provide important information for arid regions in that the best time to use a limited supply or irrigation water can be determined. (Affleck-Ariz)
W69-00374

OPTIMAL TIMING OF IRRIGATION,
California Univ., Riverside, Dept. of Engineering.
Warren A. Hall, and William S. Butcher.
Nevada Univ., Reno, Dept. of Engineering Affiliate Inst. J Irrig and Drainage Div (ASCE), Vol 94, No IR 2, Proc Paper 5993, pp 267-275, June 1968. 8 p.

Descriptors: *Irrigation efficiency, *Timing, *Dynamic programming, *Optimization, Yield equations, *Mathematical models, Water supply, Irrigation water, Analytical technique, Rates of application, Growth stages, Cost-benefit analysis, Water distribution, Supplemental irrigation.

A methodology was derived permitting determination by dynamic programming of the optimal timing of irrigation, to produce the greatest net return inclusive of the cost of irrigation. It was particularly useful under conditions in which seasonal supply was inadequate but reasonably predictable. The analysis was based on the principle that the adverse effects of deficiencies (nutrition, excessive salinity and soil moisture) were geometric when existing in combination. For general use, additional data concerning the yield coefficients will be required covering each of the critical stages in the growth of the crops independently. (Affleck-Ariz)

EFFECT OF RECLAMATION SYSTEM AND CULTIVATION ON THE DISTRIBUTION OF SALINITY AND ALKALINITY IN SOIL PROFILES IN AN AREA IN NORTHERN PART OF THE NILE DELTA,
Cairo Univ., Cairo, Egypt, Soils Dept.
Abdella Zein el Abedene, Amin Abdel Barr, and A. M. el Akyabi.
J Soil Sci (UAR), Vol 5, No 2, pp 89-109, 1965. 21 p, 7 tab, 5 fig.

Descriptors: *Land reclamation, *Cultivation, *Salinity, *Alkalinity, *Soil profiles, Soil chemical properties, Groundwater, Salts, Sampling, Chemical analysis, Ions, Sodium, Adsorption, Solubility.
Identifiers: United Arab Republic, *Cations, *Anions.

The effect of reclamation and cultivation upon chemical properties of the soil was studied in the northern Nile Delta. Ten profiles from five localities in a cultivated area and also an adjacent barren area were studied. By comparison, it was shown that salt content in the cultivated soil crust decreased from 8.19 to 0.58 m/mhos. An accumulation of salt was found at approximately 20 cm below the soil surface in cultivated soil unlike the gradual decrease of uncultivated soils. The ground water salinity of cultivated soils was 1.3 to 31.5% of the salinity of barren soils. It was also shown the cultivated soil was more alkaline due to removal of salt giving higher values for pH, exchangeable sodium percentage, soluble sodium percentage and Na/Ca + Mg ratios. (Affleck-Ariz)

SOIL MOISTURE RESPONSE TO SPRAYING BIG SAGEBRUSH WITH 2,4-D,
Rocky Mountain Forest and Range Experiment Station, Laramie, Wyoming.
Ronald D. Tabler.
J Range Management, Vol 21, No 1, pp 12-15, January 1968. 4 p, 4 fig.

Descriptors: *Soil moisture, *Spraying, Vegetation regrowth, *Evapotranspiration control, Nuclear moisture meters, Soil profiles, *Sagebrush, *Crop response, Grasses, Soil moisture meters, Moisture content, Sampling, Water loss, *2-4 D, Herbicides.
Identifiers: Plots.

This study's primary objective was to determine responses of the soil moisture regime to spraying big sagebrush. Measurements were made over a period of 3 years following treatment, as grass production increased and subsequently diminished. The study area was near Dubois, Wyoming, at 9,500 ft elevation with annual precipitation of 20 inches. Treatment consisted of spraying plots with 2,4-D in water at a rate of about 3 lb acid equivalent/acre. Gravimetric and neutron probe measurements were taken to determine soil moisture content. About 90% of the sagebrush plants on treated plots were killed by spraying. Net effect of the treatments was to depress total production below control plot levels. Spraying big sagebrush reduced the rate of soil moisture withdrawal. 75% of the difference in total moisture depletion occured within the 3-6 ft soil depth. An opposite effect in the second foot indicated that the increase in grass herbage production was most strongly reflected in that zone. Total evapotranspiration losses from the 0-6 ft soil profile were reduced about 14% over the 4-month growing period the second year after spraying. Big sagebrush grows in arid climates where the principles of the study could be applied. (Blecker-Ariz)

WATER ENTRY, WATER USE AND SEASONAL-MOISTURE REGIMES IN FLOOD-IRRIGATED RIVERINA SOILS,
Australia CSIRO, Div. of Soils.
J. Loveday, and D. R. Scotter.
Australian J Exp Agr and Anim Husb, Vol 6, pp 296-304, August 1966. 9 p, 5 fig, 7 tab.

Descriptors: Soil physical properties, Flood irrigation, Soil moisture meters, *Infiltration, *Soil water, *Water balance, *Fertilizers, Irrigation practices, Bouyoucos blocks, Crop production, Moisture content, Sampling.
Identifiers: New South Wales, Australia, Seasonal moisture regimes.

An experiment was conducted in New South Wales, Australia to determine the amount of water used by irrigated winter pasture species and the water potentials of the soils supporting vegetation. The assessment of the soil water regimes were made by both the water balance and matric potential methods. Four types of treatments were made on 14 sites. Treatments consisted of normal fertilizer and normal irrigation, extra fertilizer and normal irrigation, normal fertilizer and frequent irrigation, and extra fertilizer and frequent irrigation. The matric potential, water use, and yield data suggested that soil water was below optimum for part of the growing season on most of the soils with the normal irrigation schedule. It was concluded that water entry characteristics largely covered the yield. (Affleck-Ariz)

WATER SUPPLY FORECASTS FOR THE NORTHEASTERN UNITED STATES.
Weather Bureau, River Forecast Center, ESSA, Hartford, Conn.

Yearly ESSA publications on January 1, February 1, March 1, and April 1. Vol. 10 No. 1-4, Jan-April, 1968.

Descriptors: Water supply, *Streamflow, Northeast U. S., Seasonal.
Identifiers: *Forecasts.

These bulletins present ESSA Weather Bureau forecasts of total seasonal streamflow (November through May) to be expected from numerous

LIBRARY U. OF I. URBANA - CHAMPAIGN

watersheds in Maine, New Hampshire, and New York. The success of these forecasts is largely due to the time lag between winter precipitation and spring runoff, and to the lack of runoff produced by summertime precipitation. Forecasts are based on flow to date, precipitation to date and information on the snowpack at higher elevations. They are issued on the first of each month, January through April of each year. Five levels of possible flow or forecasts are given depending upon whether precipitation yet to fall through May 31st is equal to the minimum of record, the lower quartile, average precipitation, upper quartile, or the maximum of record. Forecasts in tabular form are summarized in narrative statements made for major basin drainages. (Strahl-ESSA)

STEVENS V SPRING VALLEY WATER WORKS AND SUPPLY CO (DAMAGES TO STREAM FLOW BY PUMPING).

42 Misc 2d 86, 247 N Y S 2d 503-512 (1964).

Descriptors: *Judicial decisions, *New York, Real property, Riparian rights, Pumping, *Perennial streams, Percolating water, *Damages, Water supply, Wells, Surface-ground water relationships, Obstruction to flow, *Water sources, Ground water.

An award for damage to plaintiff's real property allegedly caused by defendant's interference with the source of a perennial stream was affirmed by the New York Supreme Court Appellate Term. The court held that testimony of plaintiff's expert witness and admissions of defendant's chief engineer and a ground water geologist who testified for defendant as an expert presented a jury question whether there was any correlation between the pumping of defendant's well and the lowering of the water table in another well and the drying up of a stream. A riparian owner's right to a natural stream flow proects him from diversion and diminution of a stream caused by arresting and collecting underground waters which percolate through the Earth to feed the stream, according to New York case law cited as authority for the decision. (MacMillan-Fla)

CHAPPELL V WINSLOW (DIVERSION OF SURFACE WATER).
State of North Carolina.

258 N C 617; 129 S E 2d 101-107 (1963).

Descriptors: Drains, Ditches, Surface drainage, *Diversion, *Natural flow doctrine, *Surface runoff, Surface waters, Drainage water, Discharge (Water), Judicial decisions, North Carolina.

Lower land owners sought an injunction to stop upper land owners from accumulating, then discharging surface waters onto their lands. The trial court granted the injunction and the Supreme Court of North Carolina affirmed. Upper land owners have an easement, which requires lower owners to receive waters from the upper tract which flow naturally therefrom. The upper land owner may even increase and accelerate the flow. But he cannot divert the surface water so as to cause it to flow on lower land in a different manner and place. Following this rationale the trial judge decided that the defendants were not entitled to drain into a highway ditch surface water from ditches spaced about 250 feet apart. Such drainage would amount to a diversion of water from its natural flow, causing plaintiffs injury for which they had no adequate remedy at law. Plaintiffs were thus entitled to the injunction granted. (Harriett-Fla)

STATE ROADS COMM'N V PRESTON (DRAINAGE EASEMENTS).
226 Md 443; 174 A 2d 61-66 (1961)

Descriptors: *Easements, Legal aspects, Surface runoff, Drainage systems, Ditches, Channeling, *Drainage, *Water, Judicial decision, Maryland.

The state acquired in 1954, by deed, strips of land adjacent to a roadway. Also acquired was a right to maintain on or across part of the grantor's land waterway necessary for drainage. The part of the grantor's land subject to the drainage easement was clearly marked on the plats. When the state widened the road in 1955, the additional surface runoff caused by the widening was directed by ditches and pipes onto grantor's lands, causing considerable erosion. The section of the grantor's land where the water and accumulated debris were dumped had not been marked on the plats. The grantors' obtained an injunction to stop the flow of water upon their land. The injunction was upheld on appeal, because the deed did not convey a drainage easement over all of the grantors' adjacent property, but over only those portions marked on the plats. (Harriett-Fla)

HOLMES V STATE (FLOODING BY DRAINAGE INTERFERENCE).
32 Misc 2d 1077; 226 N Y S 2d 626-631 (1962).

Descriptors: *New York, Surface runoff, *Drainage water, Drainage, *Water law, Judicial decisions, Riddance (Legal aspects), *Damages.

Plaintiff brought an action for damages against the State of New York for flooding of the basement of his house caused by the construction of a highway bridge approach. The State defended the action on the ground that the design of the offending structure was in accordance with good engineering practive. The court, in holding for the plaintiff, stated that the fact that the design was in accordance with good engineering practice was not sufficient to remove liability of the State if its acts were in derogation of the rights of the claimant. As to the plaintiff's rights, the court said that a lower property owner (the state here) has a right to improve his property provided that the improvements are made in good faith and that the water is not collected and drained into the property. The court on the facts found that the defendant had gone beyond what it might do as a lower property owner without incurring liability. However, recovery was limited to injuries sustained up to the time of filing the claim. (Patterson-Fla)

WITHERS V BEREA COLLEGE (WITHHOLDING DRAINAGE WATERS NOT ACTIONABLE).
349 S W 2d 357-359 (Ky 1961).

Descriptors: *Kentucky, *Watercourses (Legal), *Surface runoff, *Drainage water, Drainage, Water law, Judicial decisions.

The case involves an action for damages and an injunction against the defendant Berea College for wrongfully causing a creek, as it passed through the land of the plaintiffs, to go dry during the summer months. The defendant had constructed a dam across a hollow and had impounded water in this area. The trial court held for the defendant on the theory that prior to the construction of the dam, the creek did not exist as a watercourse above the dam site. The court in the instant case agreed. It stated that although it is difficult to determine factually at what point water ceases to be surface drainage and becomes a natural watercourse, the law as to surface water is clear. At common law and Kentucky statute, the owner of land may collect and use as he pleases surface water that has not entered into a natural stream or definite waterbody. The court also stated that surface drainage becomes a natural watercourse where it begins to form a channel with a bed and banks, or sides and current, although the stream may be small and the flow intermittent. (Patterson-Fla)

E J HOLLINGSWORTH CO V JARDEL CO (SURFACE DRAINAGE).
178 A 2d 307-310 (Del 1962).

Descriptors: Watercourses (Legal), Storm drains, Drainage, Ditches, *Surface drainage, *Paving, Pipes, *Easements, Rain water, Surface runoff, Land development, Water law, Overflow, Flood damage, Rain, *Storm runoff, Drainage systems, Delaware.

Plaintiff brought this action to enjoin the defendant from collecting and dumping its surface water by means of a storm sewer into a pipe on plaintiff's land which in turn empties into a ditch running across plaintiff's property. Plaintiff's lands have served for innumerable years as the natural drainage area for the surface water of much of the surrounding land, including most of defendant's property. The court concluded that there had been created in defendant's favor a drainage easement across plaintiff's property. The issue was as to the defendant's rights in such easement. The defendant proposes to blacktop an area of about 27 acres. Only two-tenths of the water falling on defendant's land from any storm now flows off the ground. After the paving is completed nine-tenths will flow off. The court held that the extent of the burden which defendant will place on the easement is so great that plaintiff is entitled to a permanent injunction prohibiting defendant from permitting surface water from flowing into plaintiff's drainage pipe. (R. Smith-Fla)

WINTERSTEIN V DIETRICH (NEW DRAINS WHERE OLD DRAINS EXIST).
369 Mich 415 120 N W 2d 254-258 (1963).

Descriptors: Michigan, Judicial decisions, Farms, Ditches, Drainage, *Assessments, Subsurface drains, Drainage programs, Drainage districts, Administrative decisions.

This case concerned the construction of a new drain over an older, yet servicable, drain. The issue was whether or not an adjoining landowner of the old drain could be fully assessed for the new drain where the old drain fully met his needs. It was held that he would be liable only for the actual gain to him. The new drain was to be underground while the old drain was an open ditch designed for farm drainage. Since the landowner here was a farmer, his liability was limited by that use. (Crabtree-Fla)

PRICE V EMPIRE LAND CO (LAND DRAINAGE).
218 Ga 80; 126 S E 2d 626-630 (1962).

Descriptors: Surface waters, Surface drainage, *Diversion, Natural flow doctrine, *Discharge (Water), *Flumes, *Sumps, Diversion structures, Judicial decisions, Georgia, Surface runoff, Ditches, Drainage systems, Damages, Erosion.

The litigants owned adjoining lands. The defendants connected all surface drainage by a system of ditches, causing all waters to concentrate in three large sumps. The water from the sumps was discharged into a concrete flume which sloped to the plaintiff's property line. Plaintiff contended that this construction by the defendant caused the waters to enter plaintiff's lands with greater force than the natural flow, resulting in erosion damage to plaintiff's property. The trial court refused to grant an interlocutory injunction. The Supreme Court of Georgia acknowledged that there was evidence of damage to plaintiff's land, but decided no abuse of discretion resulted from the trial courts refusal to grant the interlocutory injunction. Plaintiff did not show that an injunction was necessary to protect the plaintiff's interest during pendency of the suit. (Harriett-Fla)

BRAUN V FOXBORO CO (DISCHARGE OF SURFACE WATERS).
193 N E 2d 680-681 (Mass 1963).

Descriptors: *Judicial decisions, *Massachusetts, Water law, Legal aspects, *Surface drainage, *Surface runoff, Conduits, Reasonable use.
Identifiers: Injunction.

Plaintiff lower landowners sought to enjoin defendant upper landowners from discharging surface and contaminated water onto the lower land. The defendants had enclosed a brook which ran through their land in an eighteen inch pipe and connected it to a culvert installed under a road abutting on plaintiff's land. The natural drainage was from the defendant's land to plaintiff's land anyway. The facts as established in a master's report showed that the periodic increases in the flow of surface water were not attributable to the defendant and that it did not contaminate such waters. Also, only seventeen percent of the average flow in the drainage system was a result of the defendant's plant operation. The court held that this was a reasonable use and the lower court was correct in dismissing plaintiff's bill seeking injunctive relief. (R. F. Williams-Fla)

WILLIS V RICH (OBSTRUCTION OF DRAINAGE EASEMENT).

30 111 2d 323, 196 N E 2d 676-680 (1964).

Descriptors: *Judicial decisions, *Illinois, Remedies, *Easements, Surface runoff, Surface drainage, Drainage systems, Drainage water, Surface waters, Drains, *Tiles, Prescriptive rights.
Identifiers: *Injunctions.

Plaintiff, owner of a dominant estate, brought an action for a mandatory injunction to compel defendant to restore a mutual drain line across defendant's servient estate to its original condition. Defendant had built a retainer wall in the natural watercourse and diverted the flow into a 15 inch tile line which was inadequate to handle the flow of water. Flooding of plaintiff's property resulted. The trial court dismissed the suit for want of equity. On appeal to the Illinois Supreme Court, held, reversed. Plaintiff had repeatedly demanded the removal of the substituted drain system. Plaintiff had a drainage easement across defendant's land prior to the obstruction and such obstruction by the defendant will ripen into an easement itself unless the mandatory injunction is granted. (R. F. Williams-Fla)

KIDWELL V BAY SHORE DEVELOPMENT CORPORATION (OBSTRUCTION TO FLOW TO SURFACE WATERS).

232 Md 577 194 A 2d 809-814 (1963).

Descriptors: Judicial decisions, Maryland, *Obstruction to flow, *Prescriptive rights, Civil law, *Natural flow doctrine, Reasonable use, Damages, Highways, *Landfills, Zoning.
Identifiers: *Servitudes.

Plaintiff was a motel owner whose property adjoined a landfill owned by defendant and filled after plaintiff's motel was built. Ocean City was a third-party defendant joined because a highway bordered plaintiff's land and because Ocean City permitted the landfill operation. When plaintiff built the motel, his land was not in Ocean City. The landfill operation obstructed the normal flow of surface water from plaintiff's land. The court held, that while Maryland is a Civil Law state as to surface waters, reasonable use could be applied for equitable reasons. Here, plaintiff secured partial relief and defendant was not held strictly liable for all damage caused. (Crabtree-Fla)

BELLVILLE V PORTER (ACCRETION AS IT RELATES TO MAINTENANCE).

130 N W 2d 426-431 (Iowa 1964).

Descriptors: Iowa, Judicial decisions, Ditches, Drainage, Riparian rights, Obstruction to flow, *Accretion (Legal aspects), Prescriptive rights, *Dikes, *Maintenance, Maintenance costs, Natural flow.
Identifiers: *Sloughes.

This case involves two watercourses, one being a ditch and the other a slough. Plaintiffs contend overflow water from the ditch flows through the slough onto defendant's property, and defendant's removal of a dike across said slough caused interference with the flow of the ditch. Plaintiffs asked further relief for maintenance of the ditch and slough. It was held that the dike did not substantially interfere with the ditch flow, and that common riparian landowners have a duty to maintain the ditch because it is a natural watercourse. (Crabtree-Fla)

WAGNER V TIDEWATER OIL CO (DAMAGE RESULTING FROM STREAM FLOW ALTERATION).

191 A 2d 326-330 (Del 1963).

Descriptors: Delaware, Judicial decisions, *Alteration of flow, Dikes, Riparian rights, Natural flow, Relative rights, *Obstruction to flow, *Embankmants, *Tidal effects, Flood damage, Repulsion (Legal aspects), Streams.

A lower riparian owner was legally answerable to the adjoining upper owner for the increase in the amount of water which found its way onto the upper owner's land as a consequence of the diversion of a creek and the alternation of its physical characteristics caused by his action to improve his own land through erection of restraining dikes composed of soft mud. It was found that employees of the lower owner were aware of the character of the mud and should have anticipated the consequence of alteration of the normal course of the stream, casting significantly increased amounts of water on the land of the upper owner. (Crabtree-Fla)

ALLEN V ATLANTA (SURFACE DRAINAGE).
219 Ga 65; 131 S E 2d 549-551 (1963).

Descriptors: Drainage, Surface drainage, Paving, *Ponding, Drainage systems, *Sewers, Surface waters, Storm runoff, Rain water, Water law, Drainage water, Storm drains, Natural flow, Georgia.

The plaintiffs alleged that the defendant by its negligent construction and maintenance of its drainage system was discharging large amounts of surface water upon the lands of the plaintiffs; that a change in the natural flow of the surface water had been caused solely by the city in installing certain paving and curb lines; and that as a result, whenever it rains extensive damage has been occasioned by the flow of waters and by the consequent ponding of waters after the rains subside. Although the plaintiffs proved some of the allegations of their petition without any rebuttal testimony being offered, there was a conflict as to a material issue of the case, that is: upon whom did the responsibility for the unquestioned water damage to the lands of the plaintiffs rest. The defendant claimed the damage was a result of a faulty or clogged drainage sewer maintained by the City of Decatur. On the basis of this conflicting evidence the court affirmed the decision of the trial judge denying the plaintiffs prayers for an interlocutory injunction. (R. Smith-Fla)

Identifiers: *Vega Alta and Vega Baja, *Hydrological atlas, *Flood occurrence, Drainage basin.

Flooding from Rio Cibuco and its tributary, Rio Indio, is reported and illustrated by USGS Hydrological Atlas HA-289 (scale 1:20,000). A base map shows the topography (contour intervals 5 and 10 m) and displays: the boundary of the 1965 flood; area flooded December 11, 1965; and spoil banks placed during 1966 and 1953-58. Most of the area flooded by Rio Cibuco is planted in sugarcane or used as pasture. In 1966 a drainage canal was constructed from the urban area (flooded in 1965) to the Rio Cibuco channel. The December 11, 1965 flood on Rio Cibuco was the highest known, reaching an elevation of 5.6 m at Central San Vicente. It is estimated that floods will reach stages of 5.6 and 5.5 m at Central San Vicente on the average of once every 68 and 34 years, respectively. The flood profile base lines were drawn to conform with the general direction of the 1965 flood flow. Maximum depth of flooding can be estimated

LIBRARY U. OF I. URBANA - CHAMPAIGN

from any point shown in the inundated area on the map. Water surface contours can also be determined by levels from a bench mark. (Llaverias-USGS)

CAPE FEAR RIVER BASIN, NORTH CAROLINA; INTERIM REPORT ON RANDLEMAN AND HOWARDS MILL PROJECTS.
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 343, 233 p, 1968. 4 fig, 1 plate, 18 tab, 37 ref, 5 attach, 2 append.

Descriptors: *Water supply, *Recreation facilities, *Floods, *Flood control, *River basin development, North Carolina, Water quality, Cost-benefit analysis, Municipal water.
Identifiers: Cape Fear River Basin, N C, Deep River Basin, N C.

The flooding, public water supply and recreational potential of the Cape Fear River basin, North Carolina, were investigated and a plan for basin-wide development of water resources is presented. The area includes the cities of Greensboro, High Point, and Burlington. The Randleman and Howards Mill dam construction projects in the Deep River Basin would provide for present and future needs, substantially supplementing the New Hope project, which is under construction. The projects would: increase the prevention of annual flood damages from 59% to 83%, provide 27,000 acre-ft of storage for water supply, provide 25,000 acre-ft of storage for water quality control, and provide excellent recreational facilities for an estimated 2,867,000 persons. First cost is estimated to be $26,320,000 with annual cost of $288,000. Annual benefits are $2,115,000 with a benefit-cost ratio of 1.7 to 1. Data on the economics, population, hydrology, water quality, power needs, and municipal water needs of the area are tabulated. (Knapp-USGS)
W69-00117

FLOOD PROFILE STUDY, SQUAW CREEK, LINN COUNTY, IOWA.
U. S. Geological Survey.

U S Geol Surv open-file rep, June, 1968. 13 p, 4 fig, 4 plate, 1 tab, 2 ref.

Descriptors: *Floods, *Flow profiles, *Flood protection, *Hydrologic data, Backwater, Floodways, Iowa, Watershed management.
Identifiers: Flood profiles, Cedar Rapids, Iowa.

Flood-inundation limits for a flood of 8,000 cfs under present channel and valley conditions are shown on maps scaled about 1 in. to 200 ft for an 18,000 ft reach of Squaw Creek, a tributary of Cedar River in Cedar Rapids, Iowa. Water surface profiles are also presented graphically for the 8,000 cfs flood and for a 5,600 cfs flood under 2 different assumed degrees of channel encroachment. Mean velocities for selected conditions at many sites are given in a table. The information presented is of particular value for planning agencies and groups involved in flood plain management. (Knapp-USGS)
W69-00129

LABORATORY AND FIELD TESTS OF POND SEALING BY CHEMICAL TREATMENT,
Tennessee Univ., Knoxville, Dept. of Agricultural Engineering.
John I. Sewell.
OWRR Project No. A-003-Tenn., Agricultural Experiment Station Bulletin 437, March, 1968. 14 p, 4 fig, 5 tab, 4 ref.

Descriptors: *Seepage, *Permeability, *Reservoir leakage, *Reservoirs, *Darcy's law, Lagoons, Ponds, Farm ponds, Water holes.
Identifiers: *Pond sealing.

Over 500 permeability tests with 8 soil-dispersing chemicals were conducted on 9 Tenn. soil types. Sodium pyrophosphate treatments at 2 and sodium carbonate (soda ash) at 5 tons per acre were the most successful. These treatments costing approximately $375 per acre for chemicals reduced the permeability of the 9 soils to from 1/10 to 1/100 of the permeability of identical but untreated samples. Laboratory test results suggest that at least 1 ft. of well compacted relatively impervious seal blanket over porous areas of pond floors is necessary to prevent rupture of the seal blanket under 10-ft. heads. 9 seriously leaking ponds were treated according to the best procedures developed in the laboratory. 8 of these treated ponds held well; and between Jan. 1 and Nov. 15, 1967, the mean ratio of minimum to maximum pond depths was 0.74. 1 pond developed serious leaks which were successfully repaired to a pond depth of 6 ft. The field tests substantiated the laboratory tests in that chemical treatments can, for certain situations, be effective in reducing reservoir seepage. (Author)

BIG SIOUX RIVER, IOWA AND SOUTH DAKOTA.
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, Senate Doc No 94, 73 p, 1968. 5 tab, 1 attach, 2 append.

Descriptors: *Flood control, *Channel improvement, *Iowa, *South Dakota, Missouri River.
Identifiers: Big Sioux River, Iowa, Sioux City, Iowa.

Flooding of the Big Sioux River, a left bank tributary joining the Missouri River just upstream from Sioux City, is described and a plan for flood control is presented. The Big Sioux River drains 9,565 sq miles in 3 states. The basin is used almost entirely for agriculture. The lower 5.5 miles of the river traverses a suburban residential area and presents a serious flooding and erosion problem. Annual flood damages are $103,100 and are expected to reach $174,900 with no control. A feasible plan includes channel straightening and widening, a cutoff at the lower end, and riprap at concave bends and bridge abutments. The cost is $2,910,000, and the benefit-cost ratio is 1.3 to 1. There are some recreational benefits. (Knapp-USGS)
W69-00235

TANANA RIVER BASIN AT FAIRBANKS, ALASKA (FLOOD CONTROL PROPOSAL).
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, Senate Doc No 89, 96 p, 1968. 1 plate, 4 photo, 1 suppl, 1 append.

Descriptors: *Flood control, *Recreation facilities, *Dams, *Levees, *Reservoirs, Cost-benefit analysis, Alaska, Floods, Flood damage.
Identifiers: Tanana River, Alaska, Chena River, Fairbanks.

Flooding in Fairbanks, Alaska, in the Tanana River Basin, is described and a proposal for flood control is presented. The 0est solution to the flood problem is a dam and reservoir on the main Chena River, a dam and detention reservoir on the Little Chena River, a levee on the tanana River, and a pumping plan0 in Fairbanks. The estimated first cost is $113,000,000 of which $111,000,000 is Federal and $2,000,000 is non-Federal. The annual cost is $261,000, and benefit-cost ratio is 2.7 to 1. The estimated annual recreational benefits are $250,000. (Knapp-USGS)
W69-00243

ALHAMBRA CREEK, CALIFORNIA (FLOOD CONTROL PROPOSAL).
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 336, 116 p, 1968. 1 fig, 2 plate, 2 photo, 1 attach, 3 append.

Descriptors: *Flood control, *Channel improvement, *Diversion, *California, Cost-benefit ratio, Floods, Flood damage.
Identifiers: Alhambra Creek, California, Martinez, California.

Flooding of Alhambra Creek, Martinez, California, was investigated and a plan for flood control is presented. Martinez is about 25 miles east of San Francisco. The drainage basin is about 5 miles long, averages 3.5 miles wide and has an area of about 16.5 sq mi. A serious flood problem exists; future damages are expected to average $291,000 per yr. Flood control by channel improvement and diversion works is economically feasible. The total cost is $8,900,000 of which $8,000,000 is federal. Annual charges would be $310,000 and benefits are estimated to be $372,000 from reduction of damage, reduction in bank protection expense, and land enhancement; the benefit-cost ratio is 1.2 to 1. (Knapp-USGS)
W69-00244

MARTIN COUNTY, FLORIDA.
Army Corps o Engineers, Jacksonville, Florida.

Army Corps of Eng, Surv-Rev Rep, 35 p, Sept 22, 1967. 1 plate, 3 tab, 1 suppl, 3 append, 1 disc.

Descriptors: *Flood control, *Water resources, *Irrigation water, *Florida, Levees, Canals, Locks, Recreation facilities.
Identifiers: Martin County, Florida.

In response to requests that Martin County be included in the Central and Southern Florida Project, the plans were reviewed and it was found that a primary canal system of 60% standard project flood capacity would be an adequate outlet for the area's flood waters. The proposed plan would eliminate floods up to 30 yr magnitude, reduce stages and durations of larger floods, provide water control, and provide facilities for supplying irrigation water from Lake Okeechobee. The estimated benefit-cost ratio is 15.3 to 1. The total cost is estimated to be $16,220,900. (Knapp-USGS)
W69-00246

WATER RESOURCES FOR CENTRAL AND SOUTHERN FLORIDA.
Army Corps of Engineers, Jacksonville, Florida.

Army Corps of Eng, Surv-Rev Rep, 75 p, Feb 15, 1968. 12 fig, 1 plate, 5 tab, 1 suppl, disc.

Descriptors: *Water resources, *Flood control, *Florida, Levees, Canals, Design flow.
Identifiers: Everglades National Park, Lake Okeechobee.

A restudy of the water supply and flood control project for central Florida, some of which is already constructed, finds that the authorized project will not meet water resource needs of the area after 1976, and presently existing works are part of the cause of a dangerously decreased flow of water into Everglades National Park. The most practicable plan is: (1) Raising Lake Okeechobee about 4 ft above presently authorized levels; (2) Provision of facilities for pumping excess water back into storage in Lake Okeechobee and the water conservation areas; (3) Provision of a system of canals, levees, pumping stations, and control structures for conveyance of water to demand areas; (4) Removal of humps from North New River and Miami Canals; (5) Provision of enough canal capacity at and below Tamiami Trial to permit design discharge at Structure 12; (6) Pumping first from agricultural canals when Lake Okeechobee must be drawn down; (7) Provision of needed recreational facilities. Estimated first cost is $76,918,300, of which $6,617,000 is for recreational facilities. Annual cost is $4,691,700, of which $698,000 is for recreation. The benefit-cost ratio is 2.8. (Knapp-USGS)
W69-00247

FLOODFLOWS FROM SMALL DRAINAGE AREAS IN ILLINOIS: PRELIMINARY FLOOD-FREQUENCY RELATIONS,
U. S. Geological Survey, Champaign, Illinois.
Davis W. Ellis.
U S Geol Surv open-file rep, 10 p, 1968. 6 fig, 4 ref.

Descriptors: *Floods, *Frequency analysis, *Small watersheds, *Illinois, Streamflow forecasting, Hydrographs.
Identifiers: Flood frequencies.

Preliminary techniques are presented for estimating flood-frequency relations, up to the 50-yr recurrence interval, for streams in Illinois that have drainage areas no greater than 10 sq miles. The defined relations will be useful for the design or improvements of highway culverts and other hydraulic structures. Annual flood discharges for 61 stations with 12 yr of record and for 36 stations with 7 yr of record were analyzed with the respect to several basin characteristics. The drainage areas for these 97 stations range from 0.02 to 40 sq miles. Two estimating techniques are presented: One requires determination of only the size of drainage basin and a regional factor; and the other requires the determination of an additional parameter, channel slope. The relative reliability of the 2 techniques is approximated. An example is given to demonstrate a step-by-step procedure of applying the techniques by computing the 25- and 50-yr floods for a site on Crooked Creek in Union County, Illinois. Nomographs relate flood frequency, drainage area, slope, and regional runoff factor. (Knapp-USGS)

SURFACE WATER LAW IN VIRGINIA.
Virginia Univ, Charlottesville.

U Virginia L Rev, Vol 44, No 1, pp 135-150, Jan 1958. 16 p, 82 ref.

Descriptors: Remedies, Runoff, Surface runoff, *Virginia, Local governments, Water law, Civil law, Judicial decisions, Legal aspects, *Repulsion (Legal aspects), *Surface waters, Riddance (Legal aspects), Reasonable use, *Discharge (Water), Obstruction to flow, Relative rights, Diversions, Abatement, Rain water, Snow melt.

Three primary divisions of surface water law are discussed. These are the definition of surface water, the theories applied by the courts in this country, and the Virginia rule and its application. Surface water is defined as water which results from rains or melting snow and is diffused over the surface of the ground, forming no part of a natural stream or watercourse. Under the civil law rule, judicial enforcement of physical law is the key determinative in resolving conflicting interests of abutting property holders. Under the common-law rule, surface water is regarded as a common enemy which every landowner may fight off as best he is able. The reasonable use theory maintains that every landowner has the right to make reasonable use of his land, even though harm is caused to his neighbor. Virginia follows the common enemy concept, modified by the proposition that one must make use of his property so as not to injure the rights of another. The application of the Virginia rule is discussed in detail.

AIRPORTS, SUBDIVISIONS AND SURFACE WATERS,
Cincinnati Univ., Ohio.
James Munro.
U Cin L Rev, Vol 30, No 4, pp 391-417, fall 1961. 27 p, 74 ref.

Descriptors: Surface waters, *Surface runoff, Drainage water, Floods, *Drainage systems, Drainage, Drainage practices, Excess water (Soils), Drainage patterns (Geologic), Damages, *Flood damage, Streams, Channels, Ditches, Surface drainage, *Repulsion (Legal aspects), Ohio.

The law of surface waters in Ohio is discussed. The decision of Mason v Vommissioners of Fulton County is analyzed for its modification of the law of surface waters. The modification per Macon permits an upper proprietor in the exercise of his servitude to cause an increase in flow, providing that the increased flow is placed in channels or watercourses already existing on the premises of the upper proprietor. But the change in an upper proprietor's right of servitude may be more illusary than real. One reason is that the Mason rule only applies to rural lands. The common enemy rule obtains with urban lands. The common enemy rule obtains with urban lands, which permits the lower owner to repel the surface water flowing onto his land. Also, recent decisions from lower Ohio courts undermine the additional protection of Mason. These decisions limit the increase of flow to the capacity of the stream. This new trend places the burden on the man who changes run-off patterns, because he runs the risk of paying damages for overburdening existing channels.

PREDICTION MODELS FOR INVESTMENT IN URBAN DRAINAGE SYSTEMS,
Virginia Polytechnic Institute, Water Resources Research Center, Blacksburg.
John W. Knapp, and W. J. Rawls.
OWRR Report A-011-VA, August, 1968. 7 p.

Descriptors: *Drainage systems, *Economic predictions, Investment, *Storm drains, *Cost analysis, Drainage practices, Controlled drainage, Small watersheds, Cost-benefit theory, *Cities.
Identifiers: Prediction models, Urban drainage systems.

Study of data from over 100 small urban drainage systems led to formulation of prediction equations for the cost of conventional storm drainage facilities. Variables studied represented both physical features and design considerations. Regression techniques and factor analysis were used to screen the variables, to verify significance and independence, and to identify design patterns. Multiple regression techniques and principal components analysis were used in selecting and fitting the prediction models. Non-linear models provided the best predictors. One type to estimate total cost included independent variables describing slope, runoff factor, smallest pipe diameter, outlet capacity, and developed area; it can be used as a planning factor before preliminary layout of the system. Another used largest and smallest pipe diameters, developed area, total length of lines, and number of inlets and manholes; it can be used for estimating cost after preliminary design layout. Both types gave correlation coefficients over 0.95 and efficiency ratios over 70%. The models can be manipulated for use in comparative benefit-cost analysis. (Author)

LEGAL DECISIONS INVOLVING WATER AND WASTEWATER,
Leo T. Parker.
Water Works and Wastes Engineering, Vol 2, No 3, pp 63-64, Mar 1965. 2 p.

Descriptors: *Judicial decisions, Water law, Legal aspects, *Cities, *Water pollution, Municipal water, *Water works, Water conveyance, Conduits, Damages.
Identifiers: Damages (Legal aspects).

This article discussed several recent decisions regarding water works. In the first, Gordon v Provo City, 391 Pac 2d 430, it was held that when a city operates a water system as a commercial venture, it is liable for negligence in maintenance and operation (in this case, the placing of a water meter) regardless of whether the water meter is placed on plaintiff's land or in the street. Fields v Kansas City, 377 S W 2d 528, held city liable for injuries sustained by plaintiff when he fell into an uncovered manhole in an unlighted alley. Pieper v City of Scottsbluff, 126 N W 2d 865, held that in an eminent domain proceeding, the actual fair and reasonable market value included the value of gravel beds on the land. Anderson v Boise Water Corp, 372 Pac 2d 752, held officials of the water works negligent for not frequently inspecting an old water main. In conclusion, several cases on nuisance, and the measure of damages therefore are discussed. (Williams-Fla)

DIFFUSED SURFACE WATER: SCOURGE OR BOUNTY,
Frank E. Maloney, and Sheldon J. Plager.
Natural Resources Journal, Vol 8, No 1, pp 72-113, Jan 1968. 42 p, 242 ref.

Descriptors: Reasonable use, Remedies, Consumptive use, Surface drainage, *Diversion, Watercourse, *Surface runoff, *Repulsion (Legal aspects), *Riddance (Legal aspects), Civil law, Nuisance (Water law), Stagnant water, *Obstruction to flow, Riparian rights, Drainage districts, Easements, Judicial decisions, Water transfer, Florida.
Identifiers: Everglades National Park, Green Swamp (Fla), Central and Southern Florida Flood Control District, 1957 Water Resources Law.

Diffused surface water is water from rain, springs, or melting snow which lies or flows on earth's surface but which does not form part of water course or lake. This excludes natural water courses and flood waters connected thereto, lakes, ponds, marshes, swamps, and water artificially brought on property. Under civil-law rule, upper owner has easement over lower owner's land for natural drainage; under common enemy rule lower owner may keep water off land by any means. Reasonable use modification to both rules allows owner to deal with diffuse surface water as he wishes as long as his act is reasonable under all circumstances. Upper owner's liability is discussed for diversion, collection and discharge, raising land level, paving surface and drainage into natural watercourse. Lower owner's liability is considered for damming back water and raising land level. Legal action may be based on trespass, negligence and nuisance. Preferred remedy is injunction. Identification of injury as permanent or temporary determines measure of damages. Defenses are contributory negligence, assumption of risk, statute of limitations and prescriptive rights. Avoidable consequences or comparative negligence rule may reduce recovery. Priority of occupation is defense in some states. (Ausness-Fla)

COMPENSABLE VALUES IN FEDERAL 'TALKING' OF DAMSITES.

Stan L Rev, Vol 14, No 4, pp 800-810, July 1962. 11 p, 58 ref.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: Judicial decisions, *Navigable waters, *Damsites, Federal government, Dam construction, *Eminent domain, Water policy, Public benefits, *Riparian land, Water law, Non-navigable waters.
Identifiers: *Navigation servitude, Constitutional law, *Property rights.

The article focuses on the amount of compensation which the fifth amendment requires the federal government to pay for taking privately owned damsite lands. The navigation servitude, which stems from congressional power to regulate interstate commerce, holds that private ownership of property in and along navigable rivers is subservient to the federal interest. This servitude extends to flood control and hydroelectric projects. In United States v Twin City Power Co, the Supreme Court indicated that compensation must be paid for the taking of private property above the mean high-water mark, except for value which is attributable to the 'flow of the stream.' However, when viewed in light of United States v Virginia Elec Power Co, these cases raise questions as to what upland values will be deemed attributable to the flow of the stream. After a careful examination of the two cases, the author concludes that they are not inconsistent on the basis of Hohfeldian analysis. United States v Grand River Dam Authority, which extended the navigation servitude to nonnavigable rivers, is discussed. It is concluded that the social cost of exercising the navigation servitude should not be overlooked. (Patterson-Fla)

SUMMARY REPORT ON THE GROUNDWATER RESOURCES OF THE ANYANG CHON BASIN,
U S Geological Survey.
J. T. Callahan, S. I. Choi, and J. S. Han.
J Geol Soc of Korea, Vol 4, No 1, pp 1-21, May 1968. 22 p, 2 fig, 4 tab, 7 ref.

Descriptors: *Water resources, *Groundwater, *Hydrogeology, Aquifers, Water quality, Water yield, Discharge (Water).
Identifiers: Korea, Anyang Chon Basin, Pumping tests.

The groundwater resources of the Anyang Chon Basin which includes the industrial cites of Anyang and Yong Dung Po Ku in the Special City of Seoul, Republic of Korea are described. Total groundwater discharge is about 24% of the total average annual rainfall of 1,240 mm. Groundwater in storage in the basin is about 1,400 million metric tons; about 190 million tons in alluvium, 980 million tons in saprolite, and 245 million tons in the crystalline rocks. Alluvial acqifers occupy about 85 sq kilometers in the basin. Bedrock consists of granite, gneiss, schist, quartzite, marble and limestone, ranging in age from Precambrian to Cretaceous. Normally the basin receives 70% of its precipitation during the summer growing season. The aquifers of the basin should yield at least 100 million metric tons of water per yr, a little more than double the pumpage in 1967. Existing pumpage is concentrated in Yong Dung Po and Anyang. To develop more ground water, well fields must be dispersed in other parts of the basin. Although the chemical, physical, and bacteriological quality of the ground water generally is satisfactory, its usefulness is threatened by industrial wastes. Waterborne disease epidemics result from improper construction of wells and the proximity of wells to pit latrines. (Knapp-USGS)

GROUND-WATER RESOURCES OF SAN JACINTO COUNTY, TEXAS,
U S Geological Survey.
W. M. Sandeen.
Texas Water Development Board, Rep 80, 89 p, Aug 1968. 19 fig, 7 tab, 37 ref.

Descriptors: *Groundwater, *Aquifers, *Appraisals, Wells, Hydrologic aspects, Water analysis, Texas.
Identifiers: *San Jacinto County, Jasper aquifer, Evangeline aquifer.

In order to determine the availability of groundwater suitable for public supply, irrigation, and industrial uses in San Jacinto County, southeastern Texas, cooperative research was conducted by the USGS and the Texas Water Development Board. Much undeveloped fresh water was found to extend to depths of 1,600 ft in the county. More than half of the 1.2 mgd withdrawn in 1965 was discharged from flowing wells. About 40,000 acre-ft/yr (or 35 mgd of fresh water) could be pumped from the Jasper and Evangeline aquifers, two of three major hydrologic units. A smaller amount of water is available from sands below 400 ft, and from the Catahoula Sandstone, another hydrologic unit. The chemical quality of groundwater is suitable for most purposes. Some waters contain less than 100 ppm/dissolved solids content. The Evangeline aquifer supplies 70% of the water used; the Jasper aquifer, 25%. Stream base-flow measurements related to rejected discharge should be developed since this recharge now rejected by the outcrop areas is an important future water source. (Llaverias-USGS)

PROBLEMS IN THE USE OF THE PUBLIC DISTRICT FOR GROUNDWATER MANAGEMENT,
Wisconsin Univ, Madison.
Stephen C. Smith.
Land Econ, Vol 32, No 3, pp 259-269, August 1956. 11 p, 29 ref.

Descriptors: *Groundwater, Legislation, State governments, Saline water intrusion, Overlying proprietor, Groundwater recharge, *Surface-groundwater relationships, *Groundwater mining, Water management (Applied), Water resources development, Coordination, Water districts, Artificial recharge, Water conservation, Pumping, Hydrologic cycle.

Many problems associated with the utilization of groundwater can be alleviated by instituting a program of groundwater management. In initiating such a program it is important that groundwater be considered as a component of the area's total water economy and that interrelationship between groundwater and surface water be considered. The execution of such a program requires the creation of some form of organization. One such form is the public district. The article indicates that the district can play a useful role as a local agency for groundwater management. Its geographic flexibility, intertemporal flexibility, concentration upon a single problem, ability to reflect local interests to obtain program adjustments, and ability to relate project costs to benefits commend the district as a groundwater management agency. On the other hand, if the problem is split into fragments, the district form of management may be used to inject an element of rigidity which will slow the process of social change.

FLORIDA'S GROUND WATER: LEGAL PROBLEMS IN MANAGING A PRECIOUS RESOURCE,
Miami Univ, Miami, Fla.
Frank E. Maloney, and Sheldon J. Plager.
U of Miami L Rev, Vol 21, No 4, pp 751-776, 1967. 25 p, 3 fig, 3 map, 129 ref.

Descriptors: Groundwater, Percolating water, Aquifers, Overdraft, *Saline water intrusion, Surface-groundwater relationships, *Artesian wells, Reasonable use, *Legal aspects, Legislation, Florida, Hydrologic cycle, Underground streams, Remedies.
Identifiers: Floridan aquifer, Biscayne aquifer.

There are four legal categories interrelated hydrologically: watercourses, diffuse surface water, underground streams and percolating groundwater. Groundwater is contained in permeable limestone beds called aquifers. In Florida two main aquifers are Floridan and Biscayne. Both water-table and artesian conditions exist. Groundwater problems are interference, overdraft, and contamination. Interference occurs between wells when cones of depression overlap. Overdraft results from pumping at a greater rate than intake of water from recharge area. Contamination includes pollution of groundwater by industrial, municipal or private wastes and salt water encroachment into aquifer - a serious problem in coastal areas. These are met by well-cupping stature, multipurpose water management districts, establishment of salt-water barrier

lines, and pollution control. Groundwater is divided into underground streams and percolating and is presumed to be percolating unless shown otherwise. Surface water law covers underground streams. Percolating groundwater is covered by two rules. Under common law rule, land owner, without malice or waste, may extract unlimited amounts and use it beyond overlying land despite harmful effects to neighbor. Under reasonable use rule, use is limited to beneficial purposes having reasonable relationship to land.

GROUND-WATER DEVELOPMENT IN DESERT AREAS,
Arizona Univ., Tucson, Dept. of Hydrology and Water Resources.
John W. Harshbarger.
Ground Water, Vol 6, No 5, pp 2-4, Sept-Oct 1968. 3 p.

Descriptors: *Water resources development, Arid lands, *Groundwater mining, *Deserts, *Water management (Applied), Computer programs, *Hydrogeology, Planning, Aquifers.
Identifiers: Sahara, Atacama-Peruvian Desert, Egyptian Desert, North American Desert, West Pakistan.

A summary of the development of ground water in several major deserts of the world during the period of 1958-1968 was given. The deserts included the Sahara, the Egyptian, the Atacama-Peruvian, and the North American deserts. Some basic principles for optimum groundwater management are listed. The Indus Basin of West Pakistan was given as an example of a model of sophisticated water management. It was concluded that physical resources and knowledge were available to develop desert areas, the computer and water systems analysis were available for guidance in water management, but man had to supply the necessary wisdom and judgment. 4C. Effects on Water OF Man's Non-Water Activities

BYERS V HAMMAN (WATER DAMAGE TO ADJOINING LAND).
State of Pennsylvania, Harrisburg.

46 Westmoreland 213-218 (Pa Com Pl 1964).

Descriptors: Judicial decisions, *Pennsylvania, Spillways, Real property, Marshes, Water level fluctuations.
Identifiers: Equity.

A complaint was filed in equity in the Court of Common Pleas of Westmoreland County, Pennsylvania, charging that the construction of a spillway on defendant's land adjoining plaintiff's property had caused a marshy condition. Defendant answered by denying the alleged facts and raising affirmative defense of laches. Upon hearing, the court dismissed the complaint by decree nisi because the plaintiff failed to prove by clear and convincing evidence that any activities upon part of defendant or her predecessors in title were the cause of the condition complained of. The court deemed it unnecessary to rule on the question of laches, the plaintiff having failed to prove a cause of action. (MacMillan-Fla)

LAMB V DADE COUNTY (LOWER RIPARIAN RIGHTS V UPPER RIPARIAN RIGHTS).

159 So 2d 477-480 (DCA Fla 1964).

Descriptors: *Riparian rights, *Dams, *Drainage systems, Saline water systems, Drainage districts, *Reasonable use, Natural flow doctrine, Riparian land, *Obstruction to flow, Barriers, Relative rights.

Defendant corporation owned, and paid taxes on, a portion of a canal used by plaintiff for primary drainage and water control. Defendant claimed exclusive rights to its portion of the canal and constructed a dam that materially altered the flow. Defendant wanted plaintiff to remove a dam built 17 years before to control salinity. The Court held that proprietor below has the right to receive from the proprietor above the usual flow of water substantially undiminished in quantity, and that the uppre proprietor has no right to unreasonably interrupt or obstruct the natural flow of water to the injury of the lower proprietor. It was established that defendant built the dam only to force plaintiff to remove the lower dam. This was held to be unreasonable. Plaintiff was given the right to maintain the canal within defendant's riparian land. (Crabtree-Fla)

GAZIN V GLADWIN (OBSTRUCTION OF AN UNDEFINED WATERCOURSE).
220 N Y S 2d 861-865 (1961).

Descriptors: New York, Judicial decisions, Damages, *Watercourses (Legal), Streams, *Obstruction to flow, *Landscaping, Landfills, Natural flow, Boundary disputes.

This was an action for damages resulting from the diversion and obstruction of a watercourse. Plaintiffs claimed that defendants raised the level of their land so as to obstruct the natural drainage from plaintiffs land. Plaintiff claimed that artificial drainage was made necessary by this obstruction. The issue was whether the water in question was a defined watercourse, such being a stream with a defined bed, bank, and sides and having a permanent source of supply. A defined watercourse may not be obstructed without raising liability for damages, but in the absence of a defined watercourse, no such liability exists. The evidence supported a finding that there was no defined waterourse and defendants had judgment on that issue. (Crabtree-Fla)

TAYLOR V CONTI (NATURAL FLOW).
149 Conn 174; 177 A 2d 670-673 (1962).

Descriptors: *Natural flow, *Surface water, Connecticut, Erosion, Flood damage, Damages, Running waters, Dams, Land development, Water law, *Silting, Slopes, Washouts, Natural streams, *Flow augmentation, Soil erosion, Farm pond.

The plaintiffs own land with a house and barn erected thereon. In 1956, they completed the construction of a dam to form a pond for swimming and fishing in the waters of a brook crossing their property. In 1957 defendant purchased 73 acres of land for the purpose of subdividing it into building lots. This land was across the street and at a higher elevation than the plaintiff's property. The defendant had DeFelice cut down the hilly areas on the land, remove large quantities of topsoil and fill, and grade, reloam and reseed the land. The defendant's land, denuded of topsoil and with its grade changed to slope toward, rather than away from the street, eroded rapidly. Silt and gravel were washed across the street into the brook and were carried to the plaintiffs' pond. They were also washed onto the floor of the plaintiffs' barn. The trial court awarded the plaintiffs $11,000.00 damages and enjoined defendant from diverting and increasing the flow of surface waters from his land onto the land of the plaintiffs. The court affirmed the holding of the trial court. (R. Smith-Fla)

EPPLING V SEUNTJENS (OBSTRUCTION OF NATURAL FLOW).
117 N W 2d 820-825 (Iowa 1962).

Descriptors: Streams, *Streamflow, Meanders, Alteration of flow, Natural flow, *Ditches, *Dikes, Damages, Flood damages, *Obstruction to flow, Iowa, Judicial decisions.

Through plaintiff's land ran a stream which also ran through the defendant's adjoining land before reaching the river. This course of the stream on defendant's property had been changed prior to plaintiff's purchase of his property. An agreement between defendant and plaintiff's predecessor in title permitted defendant to construct a ditch and dike to channel the waters rather than let the stream spread out over defendant's fields in its natural course. This agreement reserved to plaintiff all remedies against defendant for obstructing the natural flow of surface water to plaintiff's damage. Plaintiff sought redress for damages to his crops and pastures, claiming that the construction of the ditch and dike and the placing of an obstruction in the ditch impeded the natural flow of surface waters. The trial court granted plaintiff the damages. The Supreme Court of Iowa reversed on the following grounds: (1) Defendant could turn the water that came onto his land from plaintiffs in any manner as long as he did not cast it upon plaintiff's land. (2) Plaintiff's allegations of defendant's obstructing the ditch was not supported by the evidence. (Harriett-Fla)

CONRAD V WHITNEY (LANDFILLS ACROSS NON-NAVIGABLE WATERS).
141 So 2d 796-799 (Fla 1962)

Descriptors: *Florida, Judicial decisions, *Landfills, Non-navigable waters, Planning, Road banks, Riparian rights, Recreation, Ownership of beds, *Bayou, Public rights, Right-of-way.
Identifiers: Injunction.

This was a suit for a mandatory injunction to require defendants to remove a fill which they had placed across a natural non-navigable bayou upon which and under which both plaintiffs and defendants owned lands. The original owner of the lands in question subdivided same and platted streets, lots, and a waterway. The plat was not followed and when defendant's attempted to use the plat as reason for their filling operation, the court denied this reason and held that all riparian owners had common rights to the use of the bayou, and the fill must be removed. (Crabtree-Fla)

RECTOR V TOBIN CONSTR CO (HIGHWAY CONSTRUCTION AND FLOODING).

351 S W 2d 816-823 (Mo 1961).

Descriptors: Missouri, Judicial decision, Crops, Damage, Highways, *Landfill, Rivers, *Obstruction to flow, *Flood damage, Flooding, Right-of-way, State governments.
Identifiers: Crop damage, Trespass.

This was an action for crop damage from flooding caused by the defendant contractor's dirt fill placed across a river bed in connection with highway construction. Defendant was liable in that state, sovereignty did not immunize him because the fill was not called for by contract, nor directed by the highway commission, or paid for by the commission. While there was a statute providing double damages where a person stops a watercourse without court permission, it was held applicable only to permanent obstructions and not to the case here of a temporary landfill. (Crabtree-Fla)

ST ANDREWS CHURCH V TOWNSHIP OF LOWER PROVIDENCE (ACCELERATED SURFACE DRAINAGE).

414 Pa 40, 198 A 2d 860-863 (1964).

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Judicial decisions, *Pennsylvania, *Surface runoff, *Surface drainage, Water law, Legal aspects, Alteration of flow, Conduits, Cities.

The defendant township caused a roadway to be raised approximately 8 inches, thereby blocking the natural flow of surface water and causing accumulations of water to collect upon co-defendant's property. To alleviate this condition, the township installed a concrete drainage pipe under the roadway, causing the surface water which had previously flowed upon plaintiff's property (on the lower side of the road) in a diffused state to become a concentrated discharge of increased quantity. This caused flooding of plaintiff's property and accelerated filling of its cesspool. The court held that the chancellor's award of injunctive relief was proper. Pennsylvania follows the rule that one may not accumulate surface waters in an artificial channel and discharge them upon a lower owner, even if the quantity of discharge is not thereby increased. One justice dissented. (R. F. Williams-Fla)

WILLIAMS V TRUNKLINE GAS CO (RIGHT-OF-WAY).
149 So 2d 160-164 (La 1963).

Descriptors: Land tenure, Water rights, Crop production, Levees, *Flumes, Water conveyance, Bypasses, *Right-of-way, *Rice, Dams, Damages, Louisiana.

Plaintiff granted to defendant a right-of-way to lay, maintain and operate a pipe line across a tract of land owned by plaintiff. The property affected by this right-of-way had previously been leased by plaintiff to Frey for the purpose of farming rice on it. The agreement entered into between plaintiff and defendant provided for certain conditions and for damages for their breach. Frey had planted a rice crop and was flooding it when the construction of the pipe line began. There appears to be an irreconcilable conflict between the testimony of the witnesses and the trial court, apparently accepting the testimony of plaintiffs' witnesses, concluded that defendant had breached its contract with plaintiff by damming up the irrigation canal, by failing to provide for fluming of the water across the right-of-way so that water on the rice fields would remain level, and by failing to build levees along the right-of-way to keep the water from running off the land. The court affirmed the lower courts decision awarding the plaintiff damages. (R. Smith-Fla)

KAPAYANIS V FISHBEIN (STORM RUNOFF).
181 N E 2d 653-654 (Mass 1962).

Descriptors: Drainage, Flooding, *Storm runoff, Rain water, Storm drains, Precipitation (Atmospheric), *Diversion structures, Surface water, Flow, Damages, Channels, *Land development, Water law, Boundaries (Property), Massachusetts.

Plaintiff filed suit to enjoin the defendants from discharging water upon the plaintiffs' land and to obtain damages. Prior to the erection of a house on defendants property the plaintiffs had no trouble with water on their land. After the house was built water came from the roof and flowed onto the plaintiffs land. To alleviate the trouble the defendants constructed gutters with roof drains connected with a series of dry wells. These wells proved inadequate in times of heavy rains. The master found that the condition could be corrected by discharging the water from a gutter at the foot of the slope and connecting it with a street drain below the plaintiffs' land. The plaintiffs had this work done at a cost of $525.00. The trial court enjoined the defendants from permitting water to be collected and to flow on plaintiffs' land and awarded plaintiff $525.00 with interest as damages. The court modified this decree by striking out the provision for injunctive relief. (R. Smith-Fla)

SMITH V ATKINSON (DRAINAGE ENGINEERING).
180 N E 2d 542-544 (Ind 1962).

Descriptors: Surface water, Water law, Flow, Damage, Runoff, Rain, Drainage, *Rainfall-runoff relationships, Runoff coefficient, *Drainage engineering, *Watersheds (Basins), Ditches, Culverts, Land developments, Indiana, Flood damage.

The plaintiffs alleged that they were the owners of Lot 12 in Avalon Hills, and that they had erected certain improvements on Lot 12, one of which was a crushed stone driveway passing over a natural ravine and watercourse. They further alleged that they had provided for the continued drainage in the watercourse by an 18 inch culvert. Defendants, the owners of the higher ground, had improved it by laying out 300 lots and building streets, roads, and drainage ditches. The plaintiff alleged that as a consequence of this improvement the defendants diverted and discharged onto and over plaintiffs property in great quantities the surface water from their land. The defendant claimed that no water waspermitted to flow into the watercourse which did not flow into it before. The court held that the evidence adduced at the trial was conflicting as to the facts material to the issues and thus did not inescapably lead to a result other than that reached by the court. The judgment for the defendant was affirmed. (R. Smith-Fla)
W69-00053

CITY OF NORTHLAKE V CITY OF ELMHURST (PRESCRIPTIVE RIGHTS: DISCHARGE OF SEWAGE).
41 111 App 2d 190, 190 N E 2d 375-381 (1963).

Descriptors: *Juudicial decisions, *Illinois, *Prescriptive rights, Surface drainage, Drains, Surface runoff, Cities, Storm drains, Storm runoff, *Sewage, Sewers, Waste disposal.
Identifiers: *Injunctions.

The City of Northlake brought an action to enjoin the City of Elmhurst from allegedly allowing water and sewage to be discharged upon plaintiff's land. This discharge occurred when the flow in defendant's combined storm and sanitary sewer was too great to be accommodated by the outlet which led to Elmhurst's treatment plant. Defendant contended that it had a prescriptive right to such discharge. The court held that there was evidence that raw sewage was discharged on plaintiff's land and that neither a person nor a municipal corporation could be entitled to throw raw sewage on the lands of another. A permanent injunction was granted against the defendant, and it was directed to remedy the situation. The prescriptive right to discharge storm drainage was recognized. (R.F. Williams-Fla)
W69-00055

DEATON V CAUSEY (SURFACE WATER DRAINAGE - PRESCRIPTIVE PERIOD).

154 So 2d 267-269 (La 1963).

Descriptors: *Louisiana, Surface waters, *Surface drainage, Surface runoff, *Prescriptive rights, Remedies, Damages, Judicial decisions.
Identifiers: *Prescriptive Period, Injunctive relief.

This action for damages and permanent injunctive relief arose as a result of the defendant's alleged excavation and grading of his lot, which caused a constant washing to plaintiff's property by reason of the change in the drainage of the surface water. The trial court held for the defendant on the basis of no cause of action and the running of the prescriptive period. The court in the instant case reversed the trial court. It held that the facts alleged in the case were sufficient, if proved, for injunctive relief to be accorded. The court also held that since the plaintiff alleged that the cause of the damage was more or less continuous and was recognized and acknowledged by the defendant, the prescriptive period would not be deemed to have run. Even though the work was performed in 1926, where the operating cause of an injury is continuous, giving rise to damages from day to day, prescription has no application. (Patterson-Fla)

DEPARTMENT OF HIGHWAYS V ROUNDTREE (SURFACE WATER DRAINAGE OBSTRUCTION).

372 S W 2d 804-806 (Ky 1963).

Descriptors: Kentucky, Judicial decisions, Surface waters, *Surface drainage, *Obstruction to flow, Natural flow, Drainage, Highways, Easements, *Prescriptive rights, Riparian rights, Relative rights.
Identifiers: Drainage obstruction, *Catch basins.

This was an action by a highway department to enjoin the obstruction of drainage of surface waters from a highway catch basin onto defendant's lower adjoining land, wherein defendant counterclaimed for damages and injunctive relief. Defendant prevailed because he established that the catch basin tapped sources beyond the scope of any natural drainage easement, and that the highway department held no prescriptive right to discharge any additional surface water onto his land. (Crabtree-Fla).

TIEDEMAN V VILLAGE OF MIDDLETON (SURFACE DRAINAGE BY SUBSURFACE DRAINS).

25 Wis 2d 443; 130 N W 2d 783-790 (1964).

Descriptors: Wisconsin, Judicial decisions, *Surface drainage, *Drainage effects, Storm drains, *Prescriptive rights, Surface runoff, *Embankments, Road banks, Cities, Obstruction to flow, Natural flow doctrine, Relative rights.

The evidence in an action to enjoin a city from constructing a storm sewer discharging water on plaintiff's land supported findings that all the water in the drained area would naturally find its way to a pond on plaintiff's land but for a railroad embankment and despite existence of other ponding areas, that water would have reached plaintiff's pond before the embankment was constructed. In that plaintiff had no prescriptive right to embankment and no new watershed was tapped or the water volume increased, defendant city prevailed. (Crabtree-Fla)

HYDROGEOLOGY AT SHELBYVILLE, ILLINOIS - A BASIS FOR WATER RESOURCE PLANNING,
Illinois State Geological Survey.
Keros Cartwright, and Paul Kraatz.
Illinois State Geological Survey, Environmental Geology Notes, June 1967, Number 16, 15 pp, 3 map, 2 tab, 19 ref.

Descriptors: *Aquifers, Hydrogeology, *Water resources, Hydrologic data.
Identifiers: Shelbyville, Illinois, Kaskaskia river.

The impending construction of a multipurpose reservoir on the Kaskaskia river, northeast of Shelbyville, Ill., and its possible effect on the water resources of that city prompted the city to consider long-range plans for its water supply. To this end a study of the water supply, presently provided by an

aquifer system, was made. The present well field and areas for future water resource development are outlined. A quantitative appraisal of the system; estimates of potential yield of the aquifer, projection of water needs, and the economics of alternative sources of water, was carried out. It is suggested that relocation of the wells presently used, could triple the maximum daily pumpage; also the development of other sites in the area could be used for additional water supply. A ground reservoir of fairly high potential and the lake formed by the dam provide alternative sources of municipal water supply, giving Shelbyville considerable flexibility in water resource planning (Gargola-Chicago)

GEOLOGIC FACTORS IN COMMUNITY DEVELOPMENT AT NAPERVILLE, ILLINOIS,
Illinois State Geological Survey.
James E. Hackett.
Environmental Geology Notes, Number 22, June 1968, 16 pp, 4 fig, 11 ref.

Descriptors: Bed rock, Dolmite, Non structural alternatives, Flooding, *Impaired water quality, *Geologic investigations, *Water supply, Ground water, Low flow, Stream flow, Drainage basin.
Identifiers: Naperville, Ill., West Branch Dupage River, Spring Brook.

Expansion of the city by incorporation of tracts of land for subdivision and for industrial and commercial use has resulted in expansion of community service facilities for water, sewerage disposal, and storm water drainage control. Because Naperville is surrounded by unurbanized land it will continue to grow, necessitating comprehensive plans to meet future development needs. Information on geology, ground water resources, stream flow, and extent of flooding was gathered and related to various aspects of community development. Certain significant problems become evident: construction in areas subject to flooding and areas of poor drainage; impaired water quality due to the fact that Naperville is at the downstream end of the drainage basin in the county; legal and physical hindrances prevent other sources from being used, water supply must be had from underground sources. Considering these factors recommendations for future planning policies are outlined. (Gargola-Chicago)

WATERFRONT HOUSING
San Francisco Bay Conservation and Development Commission, San Francisco, California.

San Francisco Bay Conservation and Development Commission, December 1967, 37 pp, 12 fig.

Descriptors: Bays, Future planning, Urbanization, Community development, Public rights.
Identifiers: San Francisco Bay Area.

In recent years demand for housing in the San Francisco Bay area has greatly increased. The Bay area's accessibility and aesthetic appeal contribute to this increase, along with other factors such as rising incomes and increased economic feasibility. However, housing is not a necessary use of the shoreline and should not be allowed to displace those uses that of necessity must have waterfront locations. As an initial guide certain criteria should be followed, i.e. residential development should complement, not interfere with the value of the Bay as a habitate for fish and wildlife and the ability of the Bay to assimilate wastes. Planning for residential development should closely follow the adopted plans of the cities and counties around the Bay and contribute to enhancement of appearance and increase of public access. Other criteria proposals for development are discussed and twelve planning proposals for Bay area development are outlined. (Gargola-Chicago)

WATER SUPPLY AND POLLUTION CONTROL ASPECTS OF URBANIZATION,
Duke Univ., Durham, N. C., School of Law.
Edward H. Bryan.
Law and Contemp Prob, Vol 30, No 1, pp 176-192, Winter 1965. 17 p, 2 tab, 18 ref.

Descriptors: *Water pollution control, Water pollution effects, Water pollution sources, Water pollution treatment, Administration, Water resources development, *Urbanization, *Civil engineering, Sanitary engineering, *Water supply, Water quality control, Cost comparisons, Waste water treatment, Research and development, Economics.

The need to develop new technical approaches and suitable legal and political structures for the control of pollution on a regional basis are discussed from a civil engineering viewpoint. Water supply and pollution are properly approached as aspects of a single problem. Water resources in terms of quantity are inexhaustible provided the quality of wastewater is sufficiently improved prior to its return to lakes and streams thus keeping waterways in satisfactory condition and enabling downstream users to withdraw water of useable quality. Water as a transport medium for wastes is an important function in community systems. Water pollution research still is but 'a drop in the bucket.' Costs are the greatest obstacle to effective pollution control. Urbanized America must have technically sound water management. Included tables illustrate the extent of industrial water consumption and the shift of population in Florida from rural to urban areas.

4D. Watershed Protection

AN APPRAISAL OF THE QUALITY OF SURFACE WATER IN THE SEVIER LAKE BASIN, UTAH, 1964,
U. S. Geological Survey, Water Resources Division, Salt Lake City, Utah.
D. C. Hahl, and J. C. Mundorff.
Utah Dep of Natural Resources Tech Publ No 19, 1968. 44 p, 8 tab, 15 fig, 2 plate, 30 ref, append.

Descriptors: *Water quality, *Surface waters, *Hardness, *Salinity, *Irrigation water, Rivers, Sampling, Utah.
Identifiers: *Sevier Lake Basin, Utah, *Salinity hazard (Water), Sodium hazard (Water).

Dissolved solids concentration in the water of streams in the Sevier Lake Basin was found to range from 60-1,700 ppm (1964 water yr). The water is hard, of the Ca--bicarbonate type. In the East Fork and upstream part of Sevier River it had less than 500 ppm dissolved solids, mainly Ca, Mg, and bicarbonate, and hardness was 142-212 ppm. In the central reach of Sevier River, the concentrations of TDS and hardness increase. At Sevier Bridge Reservoir TDS concentration was 1,700 ppm, mostly Na and chloride, and hardness was 595 ppm. Salinity hazard is high to very high and sodium hazard is low to high. Concentration of TDS in the San Pitch River varies from 300 ppm upstream to 1,700 ppm below Gunnison Reservoir, and the composition changes from Ca-bicarbonate to Na-chloride. Salinity hazard is low to medium and sodium hazard is low. Below Sevier Bridge Reservoir, river water is diluted by springs and is less concentrated. Beaver River has less than 500 ppm TDS. Sediment concentrations in all streams range from less than 500 ppm 50% of the time to over 5,000 ppm only 5% of the time. Most sediments are carried in a few days a yr of high discharge. (Knapp-USGS)

EROSION CONTROL IN RELATION TO WATERSHED MANAGEMENT,
SCS, U. S. Department of Agriculture, Washington, D. C.
William R. Moore, and C. E. Smith.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR3, Pap 6126, pp 321-331, Sept 1968. 11 p, 4 fig, 2 tab, 8 ref.

Descriptors: *Erosion control, *Sedimentation, *Watershed management, *Multiple-purpose projects, *Benefits, Channel erosion, Structural design, Pollution abatement, Water quality control, Water resources development.
Identifiers: *Sheet erosion, *Sediment deposition, Flood Control Act, Public Law 566.

A review is given of the modern concept of watershed management and what that management concept implies to different people in the light of different kinds of activities and objectives. Erosion control aspects are presented in considerable detail covering the significance and types of erosion and sediment problems, erosion control measures, and the small watershed approach with its benefits. Erosion and sediment problems in the U S annually cost $1 billion loss or 1/4 of all soil and water losses. Sources and magnitude of sheet erosion, channel erosion, and wind erosion are described. Kinds and effectiveness of land treatment and structural measures are explained. Of 8,300 potentially feasible small watershed projects, about 325 were accorded needed installations under provision of the Watershed Protection and Flood Prevention Act, PL-566 (1954), and 6 million acres had been treated with erosion control practices by June 1966 with accumulated benefits totaling about $52 million. (Lang-USGS)

PUBLIC WORKS AUTHORIZATIONS, 1968-RIVERS AND HARBORS-FLOOD CONTROL AND MULTIPLE PURPOSE PROJECTS-PART II.
U. S. Congress Senate Comm on Public Works.

U S Senate 90th Congress, 2nd Session, Hearings Before the Subcommittee on Flood Control-Rivers and Harbors of the Committee on Public Works, April 22, 1968.

Descriptors: *Legislation, Federal government, Political aspects, Public benefits, *Government finance, Federal budgets, *North Dakota, *Missouri River, Flood control, Bank erosion, Soil erosion, Stream erosion, Erosion control, Bank protection, Stream stabilization.

The subcommittee on Flood Control-Rivers and Harbors met to consider Senate Bill S 537, 90th Congress, providing for additional bank stabilization work and maintenance on certain portions of the banks of the Missouri River between Garrison Dam and Oahe Reservoir, North Dakota. The bill would amend 77 Stat 840, which provided $3 million of federal funds for flood control in the Missouri River Basin, to provide for an additional $7 million. The subcommittee heard testimony from thirteen witnesses and received additional data submitted for the record. The testimony showed that portions of the banks of the Missouri River are subject to rapid erosion caused by sharp fluctuations of silt-free water released from Garrison Dam. The testimony also showed that many facilities as well as valuable farm land are in immediate danger from the erosion. Recommendations from the Secretary of the Army, Bureau of the Budget, and Office of the Chief of Engineers favored a $2 million increase and no provision for maintenance. The final disposition of the bill is not stated. (Molica-Fla)

TURBIDITY MEASUREMENTS AS AN INDICATOR OF SOLIDS CONTENT OF NEUTRALIZED MINE WATER,
U. S. Bureau of Mines, Pittsburgh Mining Research Center, Pittsburgh, Pa.
Maurice Deul.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 35-37, May 1968. 3 p, 2 tab, 7 ref.

Descriptors: *Acid mine water, *Suspended load, *Turbidity, *Monitoring, Particle size, Waste water treatment, Suspension, Water quality.
Identifiers: Neutralized acid mine water, Turbidity monitoring.

Turbidity measurements are accurate indicators of suspended solids content only for a narrow range of sizes and solids composition. For acid mine waters neutralized with lime or limestone, the suspended solids content as estimated by a Jackson candle turbidity apparatus diverges greatly from the actual solids content determined gravimetrically. Experimental results presented show that turbidity measurements do not give an accurate estimate of the concentration of suspended solids in neutralized mine water effluent. The suspended solids that can be expected in neutralized acid mine water effluents vary in composition, particle size and shape, and color. Especially important, in view of the sources of error in turbidimetry, is the presence of substances like gypsum, hydrous iron oxides, and calcium carbonate which may change in particle size with time and variation in composition of the water treated. OPTIMIZING SAMPLING INTERVALS,
Daniel, Mann, Johnson, and Mendenhall, DAMOC/WHO, Istanbul, Turkey.
Charles G. Gunnerson.
Proc IBM Sci Computing Symp Water and Air Resources Manage, pp 115-140, Oct 1967. 26 p, 14 fig, 2 tab, 17 ref, 2 append.

Descriptors: Analytical techniques, Data collections, Data processing, Evaluation, Frequency analysis, Frequency, *Optimization, Regression analysis, *Sampling, *Time series analysis, Variability, *Timing, Time lag, Hydrologic data, Dissolved oxygen, Statistical methods, Stream gages, Water quality control.
Identifiers: *Spectral analyses.

Several methods of obtaining the optimum sampling intervals (minimum number of readings consistent with sufficient data collection) for various water studies were investigated. A plot of sampling interval vs the extreme, mean, and quartile values of DO and specific conductance for the Potomac River showed that little change resulted from sampling at intervals of less than 12 hrs. Frequency distribution plots of coliform bacteria on several rivers indicated optimum sampling intervals and timing for several study requirements. Departures from continuous data plots of stream flow for various selected sampling intervals gave optimum intervals for different sized drainage basins. Spectral analyses was applied to measurements of DO, specific conductance and surface currents for several rivers, with the results shown in figures. Regression analysis on sequentially selected data, and other sequential selection methods were discussed. It was concluded that spectral analyses appeared to be the best method of finding optimum sampling intervals. A bibliography and the theory and techniques of spectral analysis were appended. AN EARTH-SMELLING COMPOUND ASSOCIATED WITH BLUE-GREEN ALGAE AND ACTINOMYCETES,
California Univ., Berkeley.
Lloyd L. Medsker, David Jenkins, and Jerome F. Thomas.
Environ Sci Technol, Vol 2, No 6, pp 461-64, Jan 1968. 4 p, 4 fig, 14 ref.

Descriptors: *Water analysis, *Odors, *Odor producing algae, Eutrophication, Alcohols, Actinomycetes, Cyanophyta, Spectroscopy, Gas chromatography, Analytical techniques, Water pollution sources.
Identifiers: Proton magnetic resonance spectrometry, Oscillatoria tenuis, Ramman spectroscopy, Mass spectrometry, Symploca muscorum.

A compound, with earthy-musty odor similar to that often causing problems in food and water supplies, was isolated by preparative gas chromatography from a culture of actinomycetes (No 18) and cultures of 2 species of cyanophytes, Symploca muscorum and Oscillatoria tenuis. Actinomycetes were grown in medium (M sub 1 B sub 2); cyanophytes, in Hughes medium 11 (16 liters at 26-28 deg C and 200-300 ft-candles of light). The former yielded ca 200 microg/l after 8-12 days at room temp; Symploca, 1 mg/vessel after 4-6 wk. Cyanophyte cultures were shown to be free of contaminating actinomycetes. Mass spectrum of the compound showed it to be identical with that of geosmin (C sub 12 H sub 22 0). Various analytical techniques (degradation, bromination, hydrogenation, analytical gas chromatography, high resolution mass spectrometry, infrared spectrometry and proton magnetic resonance spectrometry) showed that geosmin is a dimethyl substituted, saturated, tertiary alcohol with 2 rings in which the hydroxyl group is very sterically hindred. Structure of the ring system is unknown, but Ramman spectroscopy indicates that it may be similar to alpha-pinene. Geosmin is a colorless, viscous liquid, with camphorish odor (when concentrated) which becomes earthy upon dilution. A threshold odor of 0.05 microg/l is reported. (Eichhorn-Wisc)

5B. Sources of Pollution

WHITE V LONG (STREAM POLLUTION).

12 Ohio App 2d 136, 231 N E 2d 337-340 (Ohio Ct App 1967).

Descriptors: *Odor, *Public rights, *Relative rights, *Ohio, Natural streams, Effluent streams, Sewage treatment, Sewage effluents, Judicial decisions, Nuisance, Water pollution, Detergents, Phosphates, Potable water, Water purification, Biochemical oxygen demand, Local governments, Remedies.
Identifiers: Injunctions.

Action was brought to enjoin operation of a sewage disposal plant discharging effluent in the form of treated, purified water into a small natural watercourse 200 feet upstream from plaintiff's property. Although odor was detectible 15 to 75 feet from the stream, it was not noticeable at plaintiff's house. The water contained effluent with a small amount of odor producing matter; some phosphates, due to detergents, which would cause foaming; and 6 parts BOD per million. It was potable for humans and livestock. There was practically no pollution and the effluent was below the standard permitted by the federal government. The plant was operated as part of the county sanitation system. Location, construction, and equipment were approved by government officials. The court applied the comparative injury rule, balancing public interest against plaintiff's injury, and refused to grant the injunction. (Rives-Fla)

BARTLETT V HUME-SINCLAIR COAL MINIMG CO (POLLUTION CAUSED BY MINES).

351 S W 2d 214-218 (Mo 1961).

Descriptors: Missouri, Judicial decisions, *Water pollution, *Pollution abatement, *Water pollution effects, *Damages, Riparian land, Pollutants, Farms, Chemical precipitation, *Coal mine wastes, Strip mine wastes.

This was an action for damages resulting from pollution of streams through coal mining operations. It was held that (1) testimony of lay witnesses was competent to establish pollution, (2) where injury is temporary or remedial, the measure of damages is not the depreciation in value but the depreciation of rental or usable value during the injury, and (3) that defendant's right to control the mine land was immaterial if pollution occurred on land under defendant's control. (Crabtree-Fla)

GROUND-WATER HYDROLOGY PERTAINING TO SURFACE MINING FOR COAL--SOUTHWESTERN INDIANA,
Indiana University, Water Resources Research Center, Bloomington.

Don M. Corbett.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 164-189, May 1968. 25 p, 3 tab, 2 fig, 9 ref.

Descriptors: *Spoil banks, *Surface-groundwater relationships, *Rainfall-runoff relationships, *Recharge, *Water storage, Stripmine lakes, Stripmine wastes, Coal mines Aquifers, Indiana.
Identifiers: Man-made aquifers, Environmental changes, Coal mining.

Cast overburden, resulting from strip mining for coal in Pike County, southwestern Indiana, increases surface permeability and forms extensive man-made surficial aquifers. Increased infiltration and storage materially reduce evaporation, flood flows, and crests in wet periods, and increase both base and storm flows during dry periods in summer and fall. Final cuts form lakes which are replenished by outflow from the adjacent cast-overburden bodies. Precipitation and runoff data from 2 watersheds, one of which is extensively strip mined and the other not, are tabulated and compared. Storm runoff is 62% lower, and peak runoff is 56% lower in the mined than in the unmined watershed in wet periods. Maintenance of soil saturation and base flow in mined areas in dry periods increases both base and peak flow, but in the period of record, runoff intensity exceed 10 cfs per sq mile only once. (Knapp-USGS)

WATER QUALITY AS AFFECTED BY A WYOMING MOUNTAIN BOG,
Department of Agriculture, Forest Service, Laramie, Wyoming.
David L. Sturges.
Water Resources Research, Vol 3, No 4, pp 1085-1089, Fourth Quarter 1967. 5 p, 1 fig, 3 tab, 7 ref.

Descriptors: *Water quality, *Bogs, Potable water, Wyoming, Peat, Rocky Mountain Region, Fluctuation, Effluent stream, Groundwater.
Identifiers: Wyoming mountain bog, Elk Creek bog, Location difference, Mountain bog.

Waters collected July through October 1965 at a Wyoming mountain bog were analyzed for potability and seasonal changes in calcium, magnesium, potassium, iron, and silica. Four locations were sampled: effluent stream, fissure locations in the bog, peat locations in the bog, and groundwater. The color and turbidity of peat water greatly exceeded that at other locations and the maximum levels established by the U.S. Public Health Service for drinking water. The dissolved mineral content of all waters was very low, and the waters were of excellent chemical quality. All waters contained coliform organisms, probably of a nonfecal origin in peat and fissure water. The concentration of minerals in peat water remained constant through the sampling period. Mineral concentrations in groundwater increased in September, when the water table was at a seasonal minimum, but decreased in October following water table recharge. Silica levels were higher than other ions at all locations; the highest levels were in peat water. (Seneca-Rutgers)

PREDICTING RETURN FLOWS FROM IRRIGATION,
Bureau of Reclamation, U S Department of the Interior, Denver, Colorado, Office of Atmospheric Water Resources.
Patrick A. Hurley.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5838, pp 41-48, Mar 1968. 8 p, 3 fig, 3 tab, 3 ref.

Descriptors: *Return flow, *Irrigation, *Surface-groundwater relationships, Drainage effects, Drains, Deep percolation, Evapotranspiration.
Identifiers: Transient storage, Graphical solutions.

An analytical method for computing return flow or drainage from irrigation applications is presented and discussed. Computations consider aquifer properties, drain specing, and deep percolation. A graph for determining the fractional part of percolation remaining in transient storage is included. By using the graph and simple digital procedures, realistic estimates of irrigation return flow can be determined. The method was used to determine monthly quantities for 13 yr of return flows in the Mesilla Valley, New Mexico-Texas. (Author)

WATER AND WATER COURSES - POLLUTION,
Detroit Univ. Law School.
Leonard J. Simasko.
U of Detroit L J, Vol 16, No 4, pp 211-212, May 1953.

Descriptors: West Virginia, *Pollution abatement, Municipal wastes, State jurisdiction, Water law, Legislation, Water pollution.
Identifiers: Police power.

The West Virginia court held that a municipality could be enjoined by the State Water Commission from polluting certain rivers. City of Huntington v State Water Commission, 73 S E 2d 833 (W Va 1953). In matters of statewide interest such as watercourses a municipality can be compelled to carry out plans of the state and to perform duties imposed by the state. In addition to the enforceable interests of lower riparian owners with respect to quality and quantity of natural flow, the police power of the state provides a basis for statutory restrictions such as those here involved against pollution. That others are also polluting a watercourse or that a city is financially unable to comply with a court order is no defense.

PARTICULAR PROBLEMS OF WATER POLLUTION UNDER NEW YORK LAW AND FEDERAL LAW.
Buffalo Univ.

Buff L Rev, Vol 10, No 3, pp 473-506, Spring 1961. 34 p, 177 ref.

Descriptors: *New York, *Water pollution, Remedies, *Pollution abatement, Waste disposal, Riparian rights, Human pollution, Impaired water quality, Relative rights, Sewage disposal, *Reasonable use, Natural use, *Water pollution control, Financing, Economic feasibility, Financing feasibility, Industrial wastes.
Identifiers: International pollution control, Federal pollution control.

The basic criterion of the right of a riparian to pollute a stream under the common law of New York is that of reasonable use. This criterion is to be determined on a case by case basis. In each case, the reasonableness of the pollution is influenced by many factors. The important factors are whether the riparians are public or private, industrial or residential, the size of the stream, whether the stream is navigable or non-navigable, and the purpose for which the water is being used. The common law remedies for pollution are analyzed with a conclusion that the battle to control pollution by these remedies has been lost because of prescriptive rights, the reasonable use doctrine, and the inaction of riparian owners to exercise their rights. The article comments generally on the New York Water Pollution Act of 1949, using cases to illustrate its major problem, which is financing. The specific pollution problems in New York are mentioned along with a discussion of Federal and International (Canada) controls, which points out that New York State is not a fervent pollution abater.

RULES OF STATE BOARD OF HEALTH - POLLUTION OF WATERS.
State of Florida, Tallahassee.

Fla Admin Code, Ch 170c-5, pp 51-54B. 6 p.

Descriptors: Drainage wells, *Regulation, *Administrative agencies, Water properties, Water quality, *Florida, Standards, Water policy, *Water analysis, Thermal conductivity, Color, Odor, Toxicity, Turbidity, Oxygen, Testing, Permits, Water pollution control.

This chapter deals with the classification of waters and the regulation of drainage wells. The waters of Florida are classified according to usage. The five classes of waters are: Class I - public water supply; Class II - shellfish harvesting; Class III - recreation, and propagation and management of fish and wildlife; Class IV - agricultural and industrial water supply; and, Class V - navigation, utility and industrial use. The criteria for these classes are set forth according to the following categories: sewage, industrial wastes, or other wastes; odor; pH; dissolved oxygen; toxic substances; bacteriological quality; temperature; deleterious; and, turbidity. Each class is defined in terms of the categories applicable to it. A permit is required for the use or drilling of any drainage well. Application for this permit must contain specified data. Certain drilling requirements must be met. Test wells and abandoned wells must be filled with cement. (McDermott-Fla)

THERMAL POLLUTION OF WATER SYSTEMS,
Rutgers, The State Univ, New Brunswick, N J.
Burton Davidson, and Robert W. Bradshaw.
Environ Sci and Technol, Vol 1, No 8, pp 618-630, Aug 1967. 13 p, 8 fig, 2 photo, 34 ref.

Descriptors: *Analog computers, Biochemical oxygen demand, *Dissolved oxygen, Fishkill, Stream improvement, Optimization, *Simulation analysis, *Thermal pollution, *Temperature control, River systems, Water pollution control, Oxygen requirements, Effluents, Enthalpy.
Identifiers: Deterministic models, Purification effects, Material balance.

Simulation techniques were used to obtain the optimal stream temperature profile which resulted in maximum DO levels at every point downstream from a single source of pollution. An analog computer was used for the study. The one-dimensional, steady-state, deterministic model used was that derived by Pontryagin. The model consisted of three main elements; (1) continuous deterministic performance equations for BOD and DO (based on the work of O'Connor and Dobbins) and initial conditions; (2) a piecewise continuous decision vector function and constraints; and (3) an objective function (maximization of stream DO). Results of hypothetical examples for two intitial DO levels and four initial BOD levels were shown in graphical form. The internal consistencies of the optimal curves were checked by working the problems in reverse to obtain the BOD and DO material balances. It was concluded that hot effluents do not necessarily have an adverse effect on the DO level of a stream. (Gysi-Cornell)

LIBRARY U. OF I. URBANA - CHAMPAIGN

THE RELATION OF HUMIC COLOR TO IRON IN NATURAL WATERS,
Minnesota Univ., Minneapolis, Limnological Research Center.
Joseph Shapiro.
Verh Int Verein Limnol, Vol 16, pp 477-484, Stuttgart, Germany. Dec 1966. 8 p, 5 fig, 2 tab, 4 ref, disc.

Descriptors: Eutrophication, *Humic acids, *Iron, Water chemistry, Water quality, Color.
Identifiers: Discoloration, Peptisation.

At pH and redox values of most natural waters, iron (Fe) is insoluble. Such waters, filtered through membrane filters and analyzed for Fe, show concentrations 8-9 orders of magnitude greater than the theoretic limit. Since natural waters highly colored with humic matter usually contain high Fe concentrations, it may be supposed that compounds responsible for the discoloration may also act to hold Fe in 'solution.' Humic waters were extracted chemically (treated with cation exchange resins, solvent-extracted, freeze-concentrated and dried). Fe, added to solutions of yellow acids (YA) so obtained, was rendered filterable to degrees varying with pH of the solutions, cationic composition of the medium, and nature of the functional groups of the YA. At pH 10, solutions of YA hold concentrations of Fe (ca 80 micromoles/mg YA) 13 times greater than those at pH 5. Cations with high valence tend to coagulate Fe in solutions of YA more extensively than those with lower valence. Chemical modification of functional groups of YA altered their holding capacity. These experimental data suggest that YA not only form complexes with Fe but also act through their -COOH functional groups to form protective sols (peptisation) of collodial Fe (III). (Eichhorn-Wisc)

5C. Effects of Pollution

WILKINSON V HEALD (COST SHARING BETWEEN DRAINAGE DISTRICTS).

127 N W 2d 622-625 (1964).

Descriptors: Iowa, Judicial decisions, Outlets, *Drainage districts, River systems, *Repairing, *Maintenance costs, Ditches, *Cost sharing, Financing, Cost-benefit analysis.
Identifiers: *Common outlets.

This was an action between two drainage districts. The issue was the allocating of payment for repairs to a drainage ditch in one of the districts. The lower district, where the repairs were made, claimed that the upper district should bear part of the cost because the repaired drain was a common outlet. The upper district objected to payment because the two districts were separated by 1 fourth of a mile, and therefore maintained that the repaired ditch was not a common outlet. It was held that the repaired ditch was a common outlet and that the upper district must pay part of the expense. (Crabtree-Fla)

WILLIAMS V PENDLETON MFG CO (WATER POLLUTION IN NONNAVIGABLE CREEK).

244 S C 228-236, 136 S E 2d 291-296 (1964).

Descriptors: Ammonia, Chemical analysis, *Nitrates, *Chemical wastes, Industrial wastes, Water pollution, Riparian rights, South Carolina, Nitrogen compounds, Poisons.
Identifiers: Water Pollution Act, *Cyanide, Cyanide poisoning, Nitrate poisoning.

Defendant's company operated a manufacturing plant four miles upstream from the land of plaintiff's father. Defendant had discharged spent industrial dye stuffs into a creek flowing through this property for years. Plaintiff owned five cows which grazed this land. Four cows died of cyanide or nitrate poisoning within three hundred yards of the creek. The fifth survived with treatment. It was held that there was sufficient evidence that there were nitrates in the manufacturing plant's discharges to go to the jury. The judge properly excluded evidence of a test made of the creek one year prior to the incident. The judge, however, committed prejudicial error in charging the jury in accordance with the Water Pollution Act. There was no evidence of a violation of this Act. Furthermore, causes of action arising from violations of this Act inure solely to the State of South Carolina. The Act was not intended to create new or enlarge existing common law or statutory rights for riparian owners or others. The case was reversed and remanded for a new trial. (McDermott-Fla)

THE EFFECTS OF STRIP MINING ON THE MICROBIOLOGY OF A STREAM FREE FROM DOMESTIC POLLUTION,
Kentucky University, Department of Microbiology, Lexington.
Ralph H. Weaver, and Harry D. Nash.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 80-97, May 1968. 16 p, 5 tab, 17 ref.

Descriptors: *Acid mine water, *Aquiatic microorganisms, *Algae, *Aquatic bacteria, *Aquatic fungi, Yeasts, Hydrogen ion concentration, Iron, Sulfate, Temperature, Kentucky.
Identifiers: Acid waste microflora, McCreary County, Kentucky.

The microflora of Cane Branch, McCreary Co., Kentucky, which drains a strip-mined area, and Helton Branch, which drains a similar but nonmined area, were studied to determine the biological effects of acid mine drainage. Numbers and types of bacteria, fungi, yeasts, and algae, from both surface and bottom samples, as well as temperature and pH were studied to learn the changes of ecology with dilution and recovery. These data are tabulated by season and stream. Iron oxidizing bacteria appear to be indigenous in acid mine water and directly associated with acid formation. Ferrobacillus ferroxidans was found in Cane Branch in all seasons, but only in summer in Helton Branch. The lowering of pH to 3.0-4.1 from 6.3-6.7, with an increase in sulfates and almost total elimination of bicarbonate alkalinity, resulted in the alteration of microflora in Cane Branch, primarily the establishment of F. ferroxidans. The role of fungi in stream chemistry is as yet unknown. Cane Branch algal growth and diversity of types increased with distance from the surface of pollution where Bumilleria, which is found only in streams with acid mine waste, was the only genus present. (Knapp-USGS)

THE RELATIVE INFLUENCE OF IRON, SULFATE AND HYDROGEN IONS ON THE MICROFLORA OF A NON-ACID STREAM,
Ohio State University, Faculty of Microbial and Cellular Biology, Columbus.
Bruce McCoy, and Patrick R. Dugan.
Reprints of Pap 2d Sump on Coal Mine Drainage Res, Mellon Inst, pp 64-79, May 1968. 16 p, 3 tab, 8 fig, 6 ref.

Descriptors: *Acid mine water, *Aquatic bacteria, *Hydrogen ion concentration, *Iron, *Sulfate, Pseudomonas, Sulfur bacteria, Waste water (Pollution), Mathematical models.
Identifiers: *Flavobacterium, Heterotrophic aerobes.

The influence of acid mine drainage on the microflora of normal streams was studied to determine the extent of abatement required to restore acid polluted streams. A growth medium was used which simulated the stream nutritionally. Water composition was varied systematically in sulfate, ferric iron and pH. Survival of bacteria was correlated with variation of ionic composition and mathematical models were developed to fit the data. Relationships developed from the models were experimentally tested. The bacteria studied, Pseudomonas (M-1), Flavobacterium (M-2), and Bacillus (M-3), grow when pH is above 5.3 if iron levels are in the range 1-100 mg per ml and sulfates in the range 50-500 mg per ml. Growth increased with iron content when pH was over 5. The effect of sulfate was nonlinear and dependent on acidity; the most important variable was pH. Control measures should emphasize removal of acidity and sulfate by use of sulfate-reducing microbes, and prevention of pollution should also be emphasized. (Knapp-USGS)
W69-00098

STOCHASTIC MODEL FOR POLLUTION AND DISSOLVED OXYGEN IN STREAMS,
Virginia Polytechnic Institute, Blacksburg.
Richard P. Thayer, and Richard G. Krutchkoff.
Water Resources Res Center Rep, Va Polytech Inst, 1966. 109 p, 14 fig, 10 tab, 13 ref.

Descriptors: *Water pollution, *Stochastic processes, *Mathematical studies, *Statistical models, *Synthetic hydrology, Biochemical oxygen demand, Chemical oxygen demand, Dissolved oxygen.
Identifiers: Stochastic stream-pollution model.

A stochastic model was developed to provide a joint density function at any point downstream for both pollution and dissolved oxygen in a stream when initial conditions of BOD, COD, pollution inflow rate, pollution and oxygen decrease rate, and reaeration rate are assumed. The digital computer programs used are included. The method was checked against observations of oxygen content and scatter of data on the Sacramento River, and the results agreed. The model was also checked by mixing sugar and other nutrients with pond water, aerating the misture in cans, and monitoring changes in oxygen demand and pollution with time. (Knapp-USGS)
W69-00141

ECONOMICS OF WATER POLLUTION,
Dept. of Agriculture, Economics Research Service.
Joseph P. Biniek, and Gary C. Taylor.
Florida Univ., Institute of Food and Agri Sci, Water Research Needs: An Economic Appraisal, Pub No 3, pp 57-70, Dec. 1967. 7 p, 13 ref.

Descriptors: *Cost-benefit analysis, Pollutants, Radioisotopes, Sluices, *Federal Government, Estuarine environment.
Identifiers: Economics, *Water pollution.

Water quality is a subset of the larger field of environmental quality. There is a direct inter-relationship between polluted air, soil, and water. Water is an economic problem since it is characterized by dimensions of demand, supply, location, time, and quality. Water pollution is defined as an undesirable change in the relevant characteristics of a water supply. A classification of the origin of pollutants were listed. The costs and benefits of water pollution are inflicted by one decision making unit and borne by another without any price signals being registered in the normal market price structure. Hence, disadvantaged parties result and they try to solve the problem politically. The weighing of benefits and costs to affected parties and the design of optimizing solutions through various programs, public and private, is the economic content of the political problem of water pollution. Four major kinds of economic research appear to be needed in the water pollution area. These include economic surveys, analyses of critical problems, studies of institutions, and research to improve the analytical abilities of researchers. A partial list of sources of research data was given. (Grossman-Rutgers)
W69-00172

EFFECTS OF WATER POLLUTION IN SAN FRANCISCO BAY,
Stanford Univ., Stanford, California.
Gene E. Willeke.
Stanford U., Program in Engineering-Economic Planning, Report EEP-29, October 1968.

Descriptors: *Water pollution effects, *Social impact, Psychological aspects, Water sports, Public health, California, Attitude, Behavior, Flotsam, Ethics, Water Quality Act, Recreation demand, Intangible benefits, Turbidity, Water temperature.
Identifiers: Communication, Survey research, Discriminant analysis.

A 914-case sample survey was conducted in San Francisco Bay Area to measure attitudes toward and perception of water pollution in the Bay and to determine what effects these attitudes and perception have on use of the Bay for recreation. Information seeking, source credibility, and influence of conservation organizations were also studied. Half the respondents cited pollution as an unappealing feature of the Bay; half considered the Bay polluted. Information received, sex, and household income were good predictors. 27% believed contact with Bay water could be harmful; 28% were unwilling to eat fish caught in the Bay. Many of these same persons do not participate in recreational activities on the Bay because of perceived pollution. 24% gave pollution as a reason for not using the Bay (swimming, 20%; water skiing, 5%; fishing, 2%; boating or sailing, 2%). 1% said they had become ill or suffered harmful effects from contact with Bay water. Policy implications include need for better public information programs and more use of qualitative quality parameters. Water quality seems to be insensitively related to recreational use of a water body. (Author)

THE EFFECT OF PUMPED-STORAGE RESERVOIR OPERATION ON BIOLOGICAL PRODUCTIVITY AND WATER QUALITY,
Virginia Polytechnic Inst., Blacksburg.
S. E. Neff, and G. M. Simmons, Jr.
OWRR Project No. A-012-VA, Aug 1968. 26 p, 3 fig, 2 tab.

Descriptors: Coliforms, Effluents, Industrial wastes, Sewage effluents, Limnology, Water temperature, Chemical properties, Primary productivity, Pumped-storage, Reservoirs, *Reservoir operation, *Eutrophication, Radio carbon, Thermal stratification, Water pollution effects.
Identifiers: Virginia, Smith Mountain Lake, Carbon-14 method.

Smith Mountain Lake, Virginia is a pump-storage impoundment in which quantities of water are recycled on a daily and weekly basis. The reservoir behaves as a warm monomictic lake. Annual temperature and oxygen distribution show tendencies toward eutrophy. Recycling affects the stratification of the reservoir in summer and causes mixing of water in the vicinity of the dam. Effects of mixing can be observed up to 6.5 miles from the dam. Primary productivity estimates at four stations using the carbon-14 method range from 68. to 575. milligrams carbon/meter squared/day; these yields compare favorably with mesotrophic lakes. Municipal effluents are rapidly producing changes in the upper parts of the reservoir. Productivity estimates (1800-2200 milligrams carbon/meter squared/day) in those areas reflect enrichment and eutrophic character of the water. Coliform counts also confirm enrichment and nature of the effluent. Some correlation between the standing crop of net phytoplankton and productivity estimates was observed.
W69-00230

CORNELL SCIENTISTS SEE THERMAL POLLUTION OF CAYUGA LAKE BY PLANNED NUCLEAR POWER PLANT,
Cornell Univ., New York.
A. W. Eipper, D. E. Arnold, and W. T. Bell.
The Conservationist, Vol 23, No 1, pp 2-5, 36-37, Aug-Sept 1968. 6 p, 1 map, 2 photo.

Descriptors: *Thermal pollution, *Thermal powerplants, *New York, Nuclear reactors, Thermal stratification, Epilimnion, Hypolimnion.
Identifiers: Cayuga Lake, New York.

The present status of Cayuga Lake, the predicted effects of a proposed nuclear power plant on its thermal and nutrient structure, and the predicted impacts of these changes on the aquatic environment are described. Power plant design modifications similar to those already in use elsewhere at other such plants to eliminate thermal pollution are suggested. Cayuga Lake is 38 mi long, has a mean width of 1.7 mi, a surface area of about 66 sq mi, a maximum depth of 435 ft, a mean depth of 179 ft, and a volume of 331 billion cubic ft. The mean flushing time is 9 yr. The lake is thermally stratified in summer; the temperature in the epilimnion is 50-73 deg F and in the hypolimnion, 40-43 deg. Millikin Station, the steam power plant now operating, has a heat output of 1.3 billion BTU per hr. The proposed nuclear plant would have a heat output of 6 billion BTU per hr in a continuous water flow of 9,000 gal per sec. This would cause earlier thermal stratification, algae production, and oxygen depletion in the hypolimnion; such conditions will last longer, accelerating eutrophication. Impoundment of cooling water, the use of cooling towers, and closed-circuit cooling towers with forced-air circulation eliminate thermal pollution where they are now used and are suggested for the power stations on Cayuga Lake. (Knapp-USGS)
W69-00241

PHOSPHATE FIXATION IN ORGANIC LAKE SEDIMENTS,
Cornell Univ., Ithaca, N. Y., Conservation Dept.
Carl L. Schofield, Jr.
OWRR Project No. A-019-NY, Technical Report No 13, Cornell Water Resources and Marine Sciences Center, September, 1968.

Descriptors: *Oligotrophic lakes, *Phosphorus, Sediments, Eutrophication.

The mechanisms of phosphate fixation in organic sediments were studied in four oligotrophic lakes of the Adirondack Mountain region of New York. The forms of phosphate present were determined by sequential extraction, utilizing solvents selective for the various phosphates. Iron phosphates and occluded forms were dominant in oxidizing situations whereas aluminum phosphates were prevalent in reduced sediments. Aluminum phosphates are not as mobile as iron bound phosphates, being stable under reducing conditions. Organic phosphorus was high in all the sediments examined. Phosphate saturation was noted in one case where the sediments were largely autochthonous and low in iron and aluminum. The high soluble phosphate content in this system was conducive to higher productivity due to the high ratio of sediment area to water volume, weak thermal stratification, and low flushing rate. (Author)

A MODERN APPROACH TO THE STUDY OF ESTUARIES, WITH SPECIFIC REFERENCE TO THE DUWAMISH RIVER, WASHINGTON,
Washington Univ., Seattle.
Denny M. Miller, J. A. Wetherall, and William H. Lenarz.
Sponsored by FWPCA. Transactions of the Thirty-second North American Wildlife and Natural Resources Conference. Vol. 32, pp. 165-173, March 1967. 9 p, 1 fig., 4 ref.

Descriptors: Water pollution, Estuarine fishes, Computer models, Simulation analysis, Water quality, Mathematical models, Chinook salmon, Smolt, Mortality, Distribution, Growth rates, Marking techniques.
Identifiers: Time series analysis, Spectral analysis, BOMM, Co.

A synthesis of new and old methods is providing an effective approach to the study of complex ecological problems in the organically enriched Duwamish Estuary, Washington. Time series analysis and computer simulation techniques will be used to build abstract models of the estuarine environment. The models may be used to predict temporal and spatial changes in environmental processes and may be a valuable tool for the management of certain fisheries. Tow net and a new mass-marking technique provide a means of quantifying information on the distribution, growth, abundance and mortality of juvenile chinook salmon in estuarine waters. In studies of the survival of downstream migrant salmon, survival estimates may be markedly biased unless the sampling procedures used are designed with particular attention to fish behavior. Simulation models may be used to estimate bias and to design sampling strategies that will reduce bias in survival estimates. (D. M. Miller-Wash)
W69-00272

WATER POLLUTION--STATE CONTROL COMMITTEE.
Vanderbilt Univ., Nashville. School of Law.

Vand L Rev, Vol 17, No 3, pp 1364-1374, June 1964. 11 p, 55 ref.

Descriptors: Water pollution, *Water pollution control, *Pollution abatement regulation, *Administrative agencies, Legislation, *Permits, Water pollution effects, Discharge (Water), Pollutants, Water quality control.
Identifiers: Proposed model act.

Many states have adopted some form of centralized administrative control of water pollution. The type of control is usually categorized as either an irrational agency or a rational agency. The distinguishing feature of an irrational agency is its assumption of overall supervision of existing agencies. The rational agency, on the other hand, takes over all pollution control in the state. Preferred is the irrational agency, because it is able to ingest different kinds of technical and non-technical knowledge and is able to cut across many lines of interest. An act should not specify what waters it will apply to for this circumscribes the power of the agency. A permit system is an effective way of controlling the discharge of water. All persons who are discharging or plan to discharge water must apply for permits. The applications must contain a description of the kinds and amounts of water with mention of treatment facilities. The agency or central committee shall grant permits after studying applications. Those refused a permit may obtain a hearing.
W69-00283

ENZYMATIC DEGRADATION OF DDT BY AQUATIC ORGANISMS,
Cornell Univ., Ithaca, N. Y., Dept. of Entomology and Limnology.
Roger G. Young.
OWRR Report A-015-NY, Cornell Water Resources and Marine Sciences Center, August 1968. 7 p, 1 tab.

Descriptors: *Enzymatic degradation, *Insecticides, Aquatic organisms, Aquatic microorganisms.

The objective of the research was to determine whether a number of mammals, fish and microorganisms had enzymatic capabilities to degrade DDT to DDE. The results of experiments involving yellow perch, brown trout and rock bass indicate that fish possess the necessary enzymes to give some degree of protection in DDT contaminated water, although more species variation might be observed in a broader survey. Preliminary tests were made to determine whether metabolic conversion of the insecticide DDT could be observed in pure cultures of some common algae. The two genera studied were Chlorella vulgaris and Ankistrodesmus flacatus. Conclusive evidence for DDT breakdown was not found in these preliminary tests. (Neno-Cornell)

LIBRARY U. OF I. URBANA - CHAMPAIGN

THE HIDDEN FLORA OF A LAKE,
Hebrew University of Jerusalem.
Menachem Rahat, and Inka Dor.
Hydrobiol, Vol 31, Fasc 2, pp 186-192, 1968. 8 p, 1 tab, 27 ref.

Descriptors: *Lakes, Plants, *Algae, *Salinity, Irrigation effects, Drainage effects, *Sampling, Algae toxins, Saline water, Equilibrium, Biological communities, *Aquatic algae, Halophytes.

A survey was conducted to determine hidden algal flora of Lake Kinneret (Sea of Galilee) in the Jordan Rift Valley, Israel, which would dominate in a rise of salinity due to disturbance of present equilibrium from drainage for irrigation. The chrysomonad Prymnesium parvum which caused toxic blooms was of particular interest. Water samples were selectively enriched for halophilic algae with an inorganic salt medium. A radical change was observed. Algae rare or unknown to the lake were present. Representation of the algal groups was as follows: 7 species belonged to Chlorophyceae, 8 species to Dratomeae and 15 to Cyanophyceae. Prymnesium parvum was present in 6 of the 27 samples. Thus it was indicated that a sufficient rise of the lakes salinity would result in a predominance of halophilic algae and the presence of Prymnesium parvum forms a potential danger of toxic blooms. RESISTANCE OF TILAPIA NILOTICA L TO HIGH TEMPERATURES,
Cairo Univ., Cairo, Egypt, Zoology Dept.
H. M. Bishai.
Hydrobiol, Vol 25, No 3-4, pp 473-488, 1965. 16 p, 5 tab, 2 fig, 57 ref.

Descriptors: Temperature, Thermal stress, *Heat resistance, Fish physiology, Larvae, Fry, *Acclimatization, Resistance, *Fish behavior, *Lethal limit, *Tilapia.

The effect of different high temperatures (25 deg C) was studied on varying developmental stages of Tilapia nilotica L from Khartoum. The upper lethal temperatures and temperature tolerance were measured by holding the fish of different sizes and weights at different non lethal temperatures under similar conditions. Temperature resistance was less for both early larval and adult stages than for the fry stages. The median resistance time of larval stages was greater than that of adults. Median resistance time of the fry stage increased with an increased acclimation temperature up to 35 deg C. Temperatures greater than 35 deg C caused a marked increase in the median resistance time of both larval and fry stages. The upper lethal temperature was highest for the fry stage. Sudden and large changes of high temperature did not affect T nilotica at any stage. (Affleck-Ariz)
W69-00368

NUTRIENT AND ENERGY CYCLES IN AN ESTUARINE OYSTER AREA,
Dalhousie Univ, Halifax, Nova Scotia, Inst. of Oceanography.
Fukuzo Uyeno.
J Fish Res Bd Canada, Vol 23, No 11, pp 1635-1652, 1966. 23 p, 4 fig, 3 tab, 24 ref.

Descriptors: Chemical analysis, *Cycling nutrients, *Marine bacteria, Light, Molluscs, Oysters, Ecosystems, Energy budget, Phosphates, Water pollution sources, Nitrates, *Primary productivity, Saline water, *Estuaries, *Eutrophication, Chlorophyll.
Identifiers: Energy cycles, Microbal content, Saline ponds, Prince Edward Island, Oyster area.

The nutrient circulation and microbial abundance of oyster-producing waters in the Malpeque Bay area, Prince Edward Island, were followed at 2 stations through an open season, and the efficiency of carbon assimilation and dissimilation was estimated. Part of the organic fall-out evidently entered the water again in the spring as nutrient salts, but a certain portion was not returned and this represented a net loss from the ecosystem. The nutrient circulation at a station located in a salt-water pond was more efficient than at a station located in a river estuary. At Levi Creek (Station A), high phosphate-P concentrations in September 1962 (2.10 microgram-atoms per liter) and in November (1,42 microgram-atoms per liter) might be derived from commercial fertilizer applied to cultivated fields. Occasional high values of nitrate-N were possibly due to particulate seston, and high mean values (about 4.8 microgram-atoms per liter) from July to the end of the season were attributed to rains. In the pond mineralization was 31% of primary production, largely by mud bacteria; in the estuary (Station C) it was 17%, due about equally to mud and water organisms. (Author)

THE LIMNOLOGICAL BEHAVIOR OF IRON IN NATURAL WATER,
Illinois State Water Survey, Peoria, Water Quality Sect.
Wun-Cheng Wang, and Ralph L. Evans.
Presented at 156th Natl Meeting Amer Chem Soc, Atlantic City, N. J.

Descriptors: *Iron, Adsorption, Turbidity, Lakes, Limnology, Colloids, Phosphate, *Eutrophication, *Water chemistry, Silica, Nutrients.
Identifiers: *Particulate iron, Illinois, Peoria Lake, Freundlich isotherm, Langmuir isotherm.

A total of 9 sampling stations along 5 transects of Peoria Lake, Ill., were sampled at 1-2 week intervals from 13 March to 3 Oct 1967. Water samples were filtered through membrane filters and filters and filtrate separately analyzed for Fe (II) and total iron by standard phenanthroline method. Total iron ranged 0.69-13.01 mg/l with a mean of 3.21. Greatest majority of the iron was present as Fe (III) (range: 0.52-7.36 mg/l; mean : 2.63). Combined particulate iron was 8-12 times greater than combined dissolved iron. Iron input is greater than output, so an increase of iron in the lake can be expected. The particulate Fe (III) in this lake has several characteristics: It can be correlated with water turbidity; the relationship between particulate Fe (III) and water turbidity does not follow the Freundlich or Langmuir adsorption isotherms; there is significant correlation between particulate Fe (III), particulate Fe (II), particulate silica, and particulate phosphate; the ratio of particulate Fe (III)/particulate Fe (II) is higher than the ratio of dissolved Fe (III)/dissolved Fe (II). These results suggest that iron may form complexes with particulate matter. The dissolved Fe (III) concentration is in excess of its solubility; it may exist in fine colloid or complex structure. INDUCED RAPID RELEASE AND UPTAKE OF PHOSPHATE BY MICROORGANISMS,
Minnesota Univ., Minneapolis, Limnological Research Center.
Joseph Shapiro.
Science, Vol 155, No 37.67, pp 1269-1271, 10 Mar 1967. 3 p, 3 fig, 1 tab, 10 ref.

Descriptors: *Phosphates, Cycling nutrients, Bioindicators, Bacteria, *Microorganisms, Eutrophication, Protozoa, Cultures, *Activated sludge, Microbiology, Sludge treatment, Sphaerotilus, Escherichia, Bacillus sereus, Flavobacterium, Vorticella, Opercularia, Epistylis, E. coli.
Identifiers: Esherichia, Bacillus cereus, Flavobacterium, Vorticalla, Opercularia, Epistylis.

Mixed cultures of sludge organism including bacteria (e.g., Zooglea remigera, Escherichia intermedium, Bacillus cereus, Flavobacterium), filimentous organisms (Sphaerotilus natans), and protozoa (e.g., Vorticella, Opercularia, Epistylis) are able to release actively a large proportion of their phosphorus (P) to the medium in a matter of hours when kept under anoxic conditions. At 30 deg C, phosphate-P rises from an initial value of 4 to 70 mg/l in 3.5 hr and as much as 40% of total phosphorus originally present in the culture is released. The process, which is completely reversible upon aeration, has a change in rate (for a change of 10 deg C) of 2 to 2.5. Uptake after reaeration is inhibited by metabolic inhibitors (dinitrophenol, mercuris chloride). The amount of phosphate released per unit of sludge remains constant for concentrations ranging from 1700 to 15,800 mg sludge/l, and higher concentrations of phosphate in solution do not inhibit release. P is lost, probably as orthophosphate principally from the acid-soluble fraction of the cells. Experiments with dense cultures of E coli showed similar results. (Eichhorn-Wisc)

5D. Waste Treatment Processes

MACARTOR V GRAYLAND CREST III SWIM CLUB, INC. (REASONABLE USE TEST-PERCOLATING WATER).

187 A 2d 417-421 (Del 1963).

Descriptors: *Water law, *Percolating water, *Delaware, Judicial decisions, *Reasonable use, Wells, Remedies, Water rights, Damages.

The case involves a suit to enjoin the defendant swim club from, inter alia, using a deep well on its property to the detriment of the plaintiffs' shallow well. The court first stated that in allocating rights in percolating water, an 'objective' reasonable use test would be employed. Factors favoring the adoption of this rule are given. After a careful weighing of the equities on both sides of the case, the Chancellor granted the plaintiffs' request for an injunction on the condition that plaintiffs deepen, or allow defendant to deepen plaintiff's well to a reasonable depth with the cost to be equally divided. An alternative remedy proposed by the court is that plaintiffs run, at their own expense, a line to the defendant's public water supply, plaintiffs to thereafter pay a proportion of the costs of the public water attributable to their use. TERTIARY TREATMENT USING DIATOMACEOUS EARTH AND ACTIVATED CARBON,
Wayne State University, Dept. Civil Engineering, Detroit, Michigan.
Henry A. Dirasian.
Pap from OWRR project No A-021-Mich, Wayne State Univ, 1968. 17 p, 4 tab, 6 fig, 9 ref.

Descriptors: *Tertiary treatment, *Activated carbon, *Filtration, *Fly ash, *Diatomaceous earth, Suspended load, Chemical oxygen demand, Biochemical oxygen demand, Organic matter.
Identifiers: *Fly ash filters, *Diatomaceous earth filters.

A study was made of the effectiveness, but not the economic feasibility, of tertiary treatment of sewage by diatomaceous earth, activated carbon, and fly-ash filtration. The best results, 98.4% removal of SS and 88% of COD, were obtained using diatomaceous earth with some activated carbon. Fly ash did not work as well, but it appears desirable because of low cost. A properly graded, washed fly ash filter might yield BOD and SS removals as high as 80-90% or more. (Knapp-USGS)

WATER REUSE--WHAT DO WE MEAN,
George E. Symons.
Water and Waste Eng, Vol 5, No 6, pp 40-43, June 1968. 4 p, 4 fig, 1 tab, no ref.

Descriptors: *Water reuse, Artificial recharge, Irrigation water, Sewage treatment, Hydrologic cycle, Rivers, Water pollution, Water pollution treatment, Kansas.
Identifiers: *Reclamation (Waste water), Neosho River, Chanute, Kansas.

Water reuse is defined and discussed with particular attention to the various meanings to water users, the categories of reuse, and the current and future status of the processes involved. Reuse is defined as the use of treated or partially treated wastewater for any purpose that requires water free or substantially free of pollutants. Reuse may be accomplished through the hydrological cycle, the natural cycle, the indirect cycle, and the direct cycle. There is no control over the hydrological cycle. All water not undergoing any artificial process is in it. The natural cycle involves unplanned sequential use of water by communities in the direction of natural flow, and is very common on all populated river systems. The indirect cycle is the planned return of treated wastewater to the natural cycle, either to streams or groundwater recharge. The direct cycle is the planned treatment of wastewater for a specific immediate reuse. Direct-cycle reuse is a common industrial process, but has been used in municipal supplies only for emergency purposes. Indirect reuse of municipal water is increasing rapidly and is important for control of river pollution and for replenishing groundwater supplies. (Knapp-USGS)

FACTORS IN NEUTRALIZING ACID MINE WATERS WITH LIMESTONE,
Bureau of Mines, Dept. of the Interior, Pittsburgh Mining Research Center.
E. A. Mihok, and C. E. Chamberlain.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 265-273, May 1968. 9 p, 9 fig, 2 ref.

Descriptors: *Acid mine water, *Pollution abatement, *Waste water treatment, *Neutralization, *Calcium carbonate, Iron oxide, Acidity.
Identifiers: Iron removal.

A continuous limestone neutralization pilot plant capable of handling 100 gpm of acid-iron water was designed, constructed, and operated to study some of the factors controlling neutralization and oxidation processes. Rapid neutralization of acid water was achieved with the use of coarse crushed limestone in a rotary-kiln-type reactor. Subsequent aeration of neutralized water from the reactor removes soluble ferrous iron at the rate of 1 to 4 ppm per minute. Ferrous iron removal during neutralization and aeration is dependent on pH and temperature. In the limestone reactor, at normal mine water temperatures, soluble iron is removed at a rate of 30 to 35 ppm per minute. Although the pH of the neutralized waters ranged from 6.5 to 7.5, sufficient alkaline activity was not achieved to bring about mass precipitation of insoluble ferrous hydroxide, despite an excess of finely divided limestone remaining in suspension. The presence of an abnormally high concentration of CO_2 in the atmosphere (about 0.16 percent) at the reactor site may cause pH suppression. (Knapp-USGS)

TERTIARY TREATMENT USING DIATOMACEOUS EARTH AND ACTIVATED CARBON,
Wayne State University, Detroit, Mich.
Henry A. Dirasian.
OWRR Project A-021-MICH, June 1968, 18 p, 6 fig, 4 tab, 9 ref.

Descriptors: Water pollution control, *Diatomaceous earth, *Activated carbon, Fly ash, Filtration.

A study was conducted to determine the feasibility of treating secondary treatment plant effluents in a filter aid pressure type filter using diatomaceous earth as the filtering media while varying concentrations of activated carbon were added to enhance removals through adsorption; it was carried out in three phases. First, diatomaceous earth alone was used as filtering media. Next, activated carbon was added to diatomaceous earth, and finally, investigations were made using surplus fly ash as filtering media. Secondary waste treatment plant effluents can be further treated by this method and additional organic matter removed. Using diatomaceous earth alone about 65% of the BOD was removed and about 93% in suspended solids. Using diatomaceous earth and activated carbon removals as high as 88% of BOD and 98% of suspended solids were attained. This type of treatment indicated improvement in the quality of effluents discharged to the stream. Emphasis should be placed on removals using fly ash as the filtering media. It was felt that fly ash could do an acceptable job. Some consideration would have to be given to grading and washing of fly ash before use. It is recommended that further studies be conducted on fly ash filters.

FACTORS IN THE DESIGN OF AN ACID MINE DRAINAGE TREATMENT PLANT,
West Virginia Univ., Morgantown, School of Mines.
Charles T. Holland, James L. Corsaro, and Douglas J. Ladish.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 274-290, May 1968. 12 tab, 6 fig.

Descriptors: *Acid mine water, *Pollution abatement, *Pilot plants, *Cost analysis, *Waste water treatment, Iron oxides, Sulfate, Acidity, Lime, West Virginia.
Identifiers: *Acid mine water treatment plants, *State Water Board requirements.

A pilot plant was designed, built and operated to estimate the cost of treating acid mine drainage to meet standards of the West Virginia State Water Board. Factors investigated in the treatment of acid mine drainage are introduction of the feed water to the plant, neutralization, oxidation, sludge settling, sludge handling and disposal, land requirements, and costs. A flow sheet illustrates plant layout and the stage at which various operations are carried out. Operating expenses of a plant designed to treat 8,100,000 gpd of highly acid mine water are estimated to be 47.75 cents per 1,000 gallons, and for weakly acid water, 18.90 cents per 1,000 gallons. (Knapp-USGS)

REMOVAL OF IRON FROM ACID MINE WITH THE AID OF HIGH ENERGY RADIATION, PART III,
Brookhaven National Laboratory, Upton, New York.
M. Steinberg, J. Pruzansky, and L. R. Jefferson.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 308-318, May 1968. 11 p, 4 tab, 4 ref.

Descriptors: *Acid mine water, *Pollution abatement, *Waste water treatment, *Aeration, *Irradiation, Cobalt radioisotopes, Calcium carbonate, Iron oxides, Acidity, Limestones.
Identifiers: *Iron removal, Fulton Borehole acid mine drainage.

Experimental data are presented on the rate of oxidation and removal of ferrous iron from Fulton Borehole acid mine drainage, a high iron (350 ppm) acid water (pH-3.1) by mechanical agitation and aeration with a large excess of crushed limestone and with the effect of radiation. It appears that up to 83.5 ppm/min of Fe removal can be obtained with limestone neutralization alone at a pH less than 6.5 at a temperature of 10 deg C. Particle size, degree of agitation, and mass ratio of limestone to mine water appear to be important variables in obtaining high removal and neutralization rates. Whereas Co-60 gamma radiation can yield high rates and high chain G values for Fe removal in the absence of vigorous agitation, the incremental contribution of radiation decreases as the rate of neutralization by limestone increases. It would be difficult to justify a radiation process in view of the rate of iron removal that has already been observed with limestone neutralization. Based on this study and studies of the U S Bureau of Mines it is suggested that an engineering development program be undertaken for treating Fulton Borehole drainage with field limestone. SUMMARY OF SELECTED LITERATURE ON LAGOON AND SPRAY SYSTEMS OF TREATING FRUIT AND VEGETABLE PROCESSING WASTES,
Clemson Univ., Clemson, South Carolina.
G. H. Liner, and J. M. Stepp.
Dep of Agr Econ and Rural Sociol, S C Agr Exp Sta, Clemson Univ, 26 p, July 1968. 40 ref.

Descriptors: *Waste treatment, *Lagoons, *Sprinkler irrigation, *Reviews, *Bibliographies, Aerobic treatment, Waste water disposal.
Identifiers: Fruit and vegetable processing wastes.

The literature of the treatment in lagoons or disposal by irrigation spraying of wastes from fruit and vegetable processing plants is reviewed and a comprehensive bibliography is compiled. Characteristics of cannery wastes, technology of disposal, and costs of treatment are not discussed. Nationally, 62% of processing wastes are handled by municipal facilities and 38% are disposed of by means which ordinarily do not involve treatment. Fruit and vegetable processing are highly seasonal and often plants can not afford proper treatment facilities for discharge into streams; the use of lagoons and disposal of waste by irrigation spraying is discussed as an acceptable economical alternative. LIBRARY U. OF I. URBANA - CHAMPAIGN

A section of a septic tank drain field was constructed and tested under conditions simulating the conventional and the dosing chamber. Distribution of effluent along the length of the trench soil interface was studied. The effect of physical clogging, using bentonite as a clogging agent, also was investigated. The test section consisted of a 2' x 2' x 24' long box containing a standard trench placed in graded sand. Discharges from this section were measured at one foot intervals along the length of the section. Piezometer readings gave the depth of water at one foot intervals along the trench. Conclusions were: (1) For the conventional system using standard products for the distributor, the effluent was distributed over at most 7 feet of the trench. (2) For dosing chamber tests using dose volumes recommended by P.H.S., a distinct unbalance in the distribution resulted. (3) Uniform distribution could be obtained using a dose volume of approximately 200% of the inside volume of the distributor. (4) Physical clogging tests showed the conventional system outlasting the dosing system by approximately 30%. This condition was proven mathematically and logically. (5) A level trench bottom would provide for maximum utilization of the field regardless of flow type or slope of distributor pipe. (Santeford-Mich Tech)

5G. Water Quality Control

SANITARY WATER BD V MUNICIPAL AUTH (ADMINISTRATIVE POLLUTION ABATEMENT).
State of Pennsylvania, Harrisburg.

79 Dauph 316-323 (Pa Com Pl 1962).

Descriptors: *Pennsylvania, Judical decisions, *Administrative decisions, Administrative agencies, Water pollution control, Water quality control, *Pollution abatement, Water law, Water permits.
Identifiers: *Water Sanitary Board.

The case involves an appeal from an order of the Pennsylvania Water Sanitary Board ordering the New Oxford Municipal Authority to discontinue the discharge of treated sewage effluent into an unnamed tributary and to construct an outfall sewer elsewhere. Under section 207 of the Pennsylvania Clean Streams Law of 1937, P S 691.207, plans for new sewer systems and extensions of old ones must be submitted to and approved by the Board. Constructions nut approved or maintained in accordance with the rules and regulations of the board, are declared to be an abatable nuisance. Pollution, as defined by the statute, may also be abated by the Board. The court in the instant case rejected the Authority's challenge to the Board's order that the evidence upon which the Board based its findings and conclusions was insufficient. (Patterson-Fla)
W69-00013

INFLUENCE OF TIME AND PRECIPITATION ON CHEMICAL COMPOSITION OF SPOIL DRAINAGE,
Ohio Agricultural Research and Development Center, Wooster, and U. S. Corps of Engineers, Cincinnati.
J. P. Vimmerstedt, and P. H. Struthers.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 152-163, May 1968. 12 p, 1 tab, 11 fig, 4 ref.

Descriptors: *Acid mine water, *Leaching, *Lysimeters, *Spoil banks, *Acidic soils, Strip mines, Model studies, Weathering, Rainfall, Sulfates, Ohio.
Identifiers: Experimental soil leaching, Leachate, Spoil drainage.

An experimental strip mine spoil-leaching study to identify and measure the chemical products of spoil weathering was initiated 9 years ago in Ohio. Coal mine spoil is leached in 1 foot diameter lysimeter tubes, 4 feet deep, under natural climatic conditions. Each year's leachate is collected and analyzed for concentrations of total soluble salts, sulfate, calcium, magnesium, iron, aluminum, and manganese. The spoil sources were assigned to 4 general classes: toxic, with a pH less than 4.0 on over 75% of the outcrop area; acid, with pH of 5.0-6.9 on 50% of the area; marginal, with pH below 4.0 on 50-75% of the area; and calcareous, with pH over 7.0 on over 50% of the area. The amount of leachate and the weight of salts leached followed the same general trend as rainfall, but the total amounts of pyrite oxidation and weathering of other minerals per unit precipitation decreased with time. Toxic and marginal spoils yielded about 100 times more Fe, Al, and Mn, and 5 times more total salts than calcareous and acid spoils. Where toxic and marginal spoils are exposed, their high potential for acid and salt production must be recognized and extra care should be taken to minimize erosion and runoff and maximize infiltration. (Knapp-USGS)
W69-00092

AN EVALUATION OF FACTORS AFFECTING ACID MINE DRAINAGE PRODUCTION AND THE GROUND WATER INTERACTIONS IN SELECTED AREAS OF WESTERN PENNSYLVANIA,
Pennsylvania State University, Department of Geology and Geophysics, University Park.
Frank T. Caruccio.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 107-151, May 1968. 45 p, 11 tab, 13 fig, 22 ref.

Descriptors: *Acid mine water, *Acid bacteria, *Environmental effects, *Hydrogen ion concentration, *Calcite, Inhibition, Water quality, Groundwater, Pennsylvania.
Identifiers: Calcite-pyrite intergrowths, Acid potential, Alkaline waters.

A laboratory and field study was undertaken to find the differences between acid and non-acid strip mines, to determine the acid potential of rocks with varying sulfur content, and to correlate various factors in acid drainage, including regional water quality, regional rock type, and interactions between acid mine drainage and natural waters. Strip mines in the Clearfield area, which are underlain by acid-producing 'marine-brackish' Lower and Middle Kittaning Formations, and in the Glen Richey area underlain by non-acid-producing 'fresh-water' Freeport strata were studied. The most critical factor in acid water production is the presence of calcium carbonate; alkaline waters will abate the acidity. Bacteria catalyze pyrite oxidation, but grow only in a limited low pH range; alkaline waters sterilize the environment. Once bacteria contaminate a mine, they can produce enough acid to overcome carbonate inhibition. Bacterial generation of acid mine waters is self propagating. The difference in acid production in the 2 areas studied is possibly that pyrite in the Glen Richie area contains enough admixed calcium carbonate to prevent acid bacteria; whereas pyrite in the Clearfield area does not. (Knapp-USGS)
W69-00095

REDUCTION OF ACID PRODUCTION IN COAL MINES WITH USE OF VIABLE ANTI-BACTERIAL AGENTS,
MSA Research Corp, Division of Mine Safety Appliances Company, Evans City, Pa.
R. E. Shearer, W. A. Everson, and J. W. Mausteller.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 98-106, May 1968. 9 p, 5 fig, no ref.

Descriptors: *Acid bacteria, *Acid mine water, *Inhibitors, *Biocontrol, *Bacteriophage, Bactericides.
Identifiers: Parasitic bacteria, Caulobacter, Antibiotics (Bacterial).

Laboratory studies involving passage of water through piles of coal show that bacterial acid production can be reduced by factors as high as 30 with 3 inoculations in 6 months of natural anti-bacterial agent found in some non-acidic mines. Concentrated anti-bacterial cultures were developed on solid media; similar techniques might be used in liquid media to produce large quantities of culture of mine dosing. The nature of the anti-bacterial agent is unknown. No phages were seen with the election microscope, but washing with distilled water in sampling may have destroyed them. The inhibitor may be a competition effect from Caulobacter, which was observed in inhibited cultures and may have either obstructed the access of acid bacteria to their nutrient or acted as a parasite. Antibiotics produced by other organisms may be involved. (Knapp-USGS)

AN EXPERIMENTAL STUDY OF FERROUS IRON IXIDATION IN ACID MINE WATER,
U. S. Bureau of Mines, Pittsburgh Mining Research Center, Pittsburgh, Pa.
Ann G. Kim.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 40-45, 1968. 6 p, 3 fig, 2 ref.

Descriptors: *Acid mine water, *Waste water treatment, *Oxidation, *Iron, *Aeration, Chemical oxygen demand, Iron bacteria, Sulfides, Sulfates.
Identifiers: Ferrous iron oxidation.

Samples of natural mine water were studied to determine the effect of aeration upon the rate of oxidation. The rate of oxidation of ferrous iron in an acid environment depends upon the concentrations of ferrous iron and dissolved oxygen, and upon the temperature. Eight 1-liter samples were used for each test. Four samples were aerated at rates of 200 cubic centimeters per liter per minute and 2,000 cubic centimeters per liter per minute; 2 were in open containers to allow normal oxygen diffusion from the air into the water and 2 were in closed containers with dissolved oxygen originally present in the water. Aeration was found to have no beneficial effect upon a low ferrous iron water (34 ppm) because the water had an adequate amount of dissolved oxygen. It did decrease the time necessary for complete oxidation in waters with 175 to 260 ppm ferrous iron, evidently by keeping the water saturated with dissolved oxygen. (Knapp-USGS)

INVESTIGATION PROGRAM FOR AQUIFER PROTECTION REQUIREMENTS, CHICAGOLAND DEEP TUNNEL PLAN,
Harza Engineering Company, Water Resources Planning Division, Chicago, Ill.
I. S. Papadopulos, and R. E. Aten.
Ground Water, Vol 6, No 3, pp 4-9, May-June 1968. 6 p, 2 fig, 3 ref.

Descriptors: *Sewage disposal, *Runoff, *Tunnels, *Injection wells, Model studies, Permeability, Illinois, Rainfall intensity, Aquifers, Water quality, Water storage, Groundwater, Analog models, Sewers, Exploration.
Identifiers: *Aquifer protection, *Chicago, Pumping tests, Injection tests.

A study is described of requirements for aquifer protection in connection with Chicago's Deep Tunnel Plan for Flood and Pollution Control being implemented by the Metropolitan Sanitary District. Plans call for temporary storage of combined sewer overflows in a system of tunnels about 800 ft below the city. The same sewer system is used for municipal waste and surface drainage. When rainfall intensity is over 0.1 in. per hr, the system now overflows and raw sewage enters streams. Proposed controls include separate sewer systems, concentric sewer-pipe systems, shallow holding tunnels, and the deep tunnel plan, which is considered the best and most economical. Favorable tunnel location is in the Galena-Platteville dolomite, which contains the aquifer that must be protected from contamination. Electric analog studies using available data show that protection can be provided by operating recharge wells so as to maintain continuous flow into the tunnels. Recent studies include detailed exploratory drilling, aquifer test, pumping tests in the zone to be tunneled, injection tests, and an analog model analysis for showing future effects of the tunnels and recharge operations. (Knapp-USGS)

MINE AIR SEALING: A PROGRESS REPORT,
Bureau of Mines, Dept. of the Interior, Pittsburgh Mining Research Center.
Noel N. Moebs.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 255-264, May 1968. 10 p, 8 fig.

Descriptors: *Acid mine water, *Mine drainage, *Pollution abatement, *Model studies, *Research and development, Coal mines, Pennsylvania.
Identifiers: *Coal mine sealing, Air sealing, Upper Freeport coalbed.

A small, abandoned above drainage coal mine in the Upper Freeport coalbed in western Pennsylvania, which discharges acid water, was air sealed in 1966 to determine if the acidity and iron of the discharge could be reduced. The geologic and hydrologic environment of the mine were investigated to aid in evaluating the effectiveness of air sealing and indicate the controlling factors. Ground water level, quality, and composition of the overburden were obtained from drill holes. The atmosphere in the sealed mine was sampled periodically, and the differential air pressure across the seal was recorded. The flow rate fluctuates between 6 and 632 gpm. About 30 percent of the total annual precipitation over the 77-acre area percolates downward into the mine. The water table over most of the mined area has been depressed as a result of mining, and some springs and wells on the property were lost during mining. Water pH remained between 3.0 and 3.5 for the duration of the experiment, and total iron decreased slightly, as has the total acidity. For the first 19 months after sealing there was no significant improvement in the quality of the mine effluent which could be attributed to sealing, other than a decrease in variance. (Knapp-USGS)

Grover H. Emrich, and D. R. Thompson.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 190-222, May 1968. 33 p, 52 fig.

Descriptors: *Mine drainage, *Coal mines, *Bituminous materials, *Acid mine water, *Water quality, Acidity, Alkalinity, Water quality control, Standards, Pennsylvania.
Identifiers: Bituminous coal mine drainage.

Data on quality and quantity of deep bituminous coal mine drainage water (in western Pennsylvania) are compiled and presented on maps. The quality data are mapped in simplified form and percentages of mines with acid water are compiled for each county. Numbers of mines with acid, alkaline, and no discharge are also given by county. In general, the younger coal seams (Sewickley-Pittsburgh) have more alkaline discharges and the older seams (Clarion-Brookville) have acid discharges. Several seams vary regionally in discharge quality. Sewickley and Pittsburgh are alkaline in the southwest counties because of the presence of larger, proportions of limestone, and more acid north and east where there is less limestone. There is a low-acidity band in Clearfield, Armstrong, and Indiana counties in the Lower Freeport Seam; to the northwest and southeast, discharges are acid. (Knapp-USGS)

MIGRATION OF BACTERIOPHAGE T4 IN PERCOLATING WATER THROUGH SELECTED OAHU SOILS,
Hawaii Univ., Honolulu.
Richard M. Tanimoto, Reginald H. F. Young, and Nathan C. Burbank, Jr.
OWRR Project No. A-001-HI, Water Resources Research Ctr, Tech Rpt No 20, Jun 1968. 45 p, 9 fig, 4 tab, 64 ref.

Descriptors: *Viruses, *Bacteriophage, Percolation, Ground-water, Water pollution.

Tests to determine the ability of three Oahu soils to remove the coliphage T4Br11 mutant virus from water percolating through low humic latosols (Wahiawa and Lahaina soils) proved the soils ability to retain the virus but only at depths greater than 21/2 inches. Absorption was 100% when the concentration applied was 2.5 x 10 to the 6 power virus per ml of feed solution. Breakthrough at lesser thicknesses of soil occurred slowly at first then increased rapidly with time. Tantalus tuff, a cindery pumice substratum was ineffective in retaining viruses even at soil thicknesses of as great as 15 inches. (Burback-Hawaii)

GUIDELINES FOR ESTABLISHING WATER QUALITY STANDARDS FOR INTERSTATE WATERS.
Federal Water Pollution Control Admin., Washington, D. C.

Guidelines for Establishing Water Quality Standards for Interstate Waters, pp 1-10, Jan 1967. 10 p.

Descriptors: *Pollution abatement, *Water policy, *Water Quality Act, *Administration, Water law, Administrative decisions, Federal government, State governments, Watercourses (Legal), Interstate, Interstate rivers.
Identifiers: Water Pollution Control Act, *Interstate waters, Department of the Interior.

The Federal Water Pollution Control Act, as amended by the Water Quality Act of 1965, provides for the establishment of water quality standards for interstate waters. Unless a state adopts water quality criteria and plans for implementing them, and they are approved by the Secretary of the Interior, the Secretary is authorized to establish them. This paper purports to present guidelines for developing water quality criteria and plans for implementing and enforcing them, and to delineate factors which the Secretary will consider in approving a state's actions in this matter. The primary guidelines are found in the Federal Water Pollution Control Act, the Water Quality Act of 1965, and legislative history. Conservation values must be considered under this legislation. A cornerstone of the policy guidelines, which are set forth in considerable detail, is that no one has the right to pollute. Discharge of untreated wastes into interstate streams should be eliminated under a State's plans. The term 'interstate waters', which defines the coverage of legislation behind the standards, is amplified. Means of obtaining cooperative assistance from the Federal Water Pollution Control Administration are outlined.

THE ECONOMICS OF REGIONAL WATER QUALITY MANAGEMENT: WATER POLLUTION AND RESOURCES ALLOCATION BY PRIVATE MARKETS,
Allen V. Kneese.
Baltimore, Johns Hopkins Press, 1964. p. 38-53.

Descriptors: *Water allocation (Policy), *Water pollution control, *Economic efficiency, *Damages, Costs, Cost sharing, Administration, Decision making, Diseconomies of scale, Water pollution effects, Water pollution treatment, Water rights, Remedies, Upstream, Downstream, Water users, Water shortage, Water law, Technology.

Most economists consider the market system as an efficient device for allocating resources pursuant to consumer wants. Water pollution is a classic example of technological external diseconomy. One key to the pollution problem is the failure of municipal and industrial waste dischargers to consider that subsequent water uses may be made more expensive or foreclosed entirely by the discharge. The results are higher costs of treatment and increasing wastes. There is a close relation between the nature of property rights and the occurence of external diseconomies. Property rights should be structured such that upstream polluters will take into account downstream costs. Legal remedies are inadequate in several respects. The possibility of internalizing the externalities into a private decision making unit over an entire basin is discussed. The relationship of upstream discharges and downstream damages is also discussed. Downstream costs must be measured against upstream depletion reduction. Consideration of water shortages involve the same principles. The market place and judicial system do not automatically result in realization of downstream damages.

THE ECONOMICS OF REGIONAL WATER QUALITY MANAGEMENT: NATURE OF THE PROBLEM,
Allen V. Kneese.
Baltimore, Johns Hopkins Press, 1964. p 3-34.

Descriptors: *Water quality, *Water pollution, *Pollutants, *Water pollution treatment, Water quality control, Institutions (Planning and organizational agencies), Pollutant identification, Biochemical oxygen demand, Technology, Water pollution effects, Waste dilution, Artificial recharge, Recirculated water, Desalination, Regulated flow.

Despite the great interest in the problem of water quality and recent pollution control efforts, serious problems still exist and action by economists and public administrators is needed. Water quality management raises questions as to the determination of water quality, the systems to achieve that quality, and the institutions to administer that quality. Pollutants can be categorized as degradable and nondegradable. The measurement of degradable organic wastes and the rate of waste degradation presents technical problems. One measure is biochemical oxygen demand, BOD. Automatic monitoring is becoming more widespread. There is less certainty in the water environment field than most other scientific fields. Water quality may be improved by treating wastes or by increasing dilution. Methods of treating waste water are described. Water supply treatment is similar in nature. Other treatment subjects include direct recirculation, desalinization, divided distribution systems, and artificial recharge. Dilution of wastes may be accomplished by alteration of either the pattern of streamflow or waste discharge. This section concludes with considerations of economic factors and administrative decision-making processes.

FEDERAL AIR AND WATER CONTROL: THE APPLICATION OF THE COMMERCE POWER,
George Washington Univ., Washington, D. C.
Sidney Edelman.
George Washington L Rev, Vol 33, No 5, pp 1067-1087, June 1965. 21p, 122 ref.

Descriptors: *Air pollution, Impaired water quality, Public health, *Water pollution, Pollution abatement, *Water pollution control, Control, Federal government, Interstate, Water law, Clean Air Act, *Federal jurisdiction, Judicial decisions, Water rights, Legislation, Jurisdiction, State governments, Legal aspects, Navigable waters.
Identifiers: Constitutional law.

The federal commerce power is analyzed on the basis of its application to air and water pollution. Federal statutes designed to allow the Attorney General to bring court actions to secure abatement of both interstate and intrastate pollution are discussed. The constitutional basis for the exercise of such power is given primary emphasis. The issue is not difficult when pollution is interstate. Control fits clearly within the confines of the commerce power. When intrastate water pollution takes place in a navigable stream, the basis of federal control is considered similarly clear. Federal jurisdiction over intrastate air pollution rests on the fact that such pollution affects interstate commerce, or obstructs the navigable air space. It is concluded that the same principles which serve as a basis for congressional authority to protect navigable waters as highways of interstate commerce are applicable to navigable air space.

MINE WATER RESEARCH: THE LIMESTONE NEUTRALIZATION PROCESS,
Bureau of Mines, Department of the Interior, Pittsburgh, Pa.
E. A. Mihok, Maurice Deul, C. E. Chamberlain, and J. G. Selmeczi.
U. S. Bureau of Mines Report of Investigations 7191, September 1968, 20 p, 14 fig, 7 tab, 3 dwg, 6 photo, 3 chart, 6 ref.

Descriptors: *Neutralization, *Limestones, *Acid mine water, *Water pollution treatment, Acidity, Alkalinity, Carbon dioxide, Chemical precipitation, Aeration, Oxidation, Sedimentation, Slurries, *Particle size, Water chemistry, Carbonates, Acidic waters, Autogenous grinding.
Identifiers: Stream improvement, Pollutants, Water quality, Reclaimed water, Mine water.

A pilot plant for treating mine drainage by neutralization with limestone was designed, fabricated, and operated. The process produces a very fine (minus 400-mesh) limestone slurry in a tube mill, mixes the slurry with mine water, aerates mixture to remove carbon dioxide and precipitate iron, and separates solids from the liquid by sedimentation. Water of pH 2.8, 1,700 ppm total acidity, 36 ppm ferrous iron, and 360 ppm iron, was treated at rates of 300 to 400 gpm and ultimately reached a pH of 7.4 and contained no detectable iron. The sludge compacted to one-third the volume from mine water neutralized with lime. The advantages of the limestone process are wide distribution and low cost of limestone, simplicity, reduction of hazards and of operating and maintenance costs by use of a less reactive agent, higher solids concentration in the sludge, and no deleterious effect caused by overtreatment. Cost of treating mine water by the limestone process is at least one-third to one-half the cost of the lime process. (Mihok-Bur Mines)

06. WATER RESOURCES PLANNING

6A. Techniques OF Planning

OPTIMIZATION METHODS IN WATER RESOURCES PLANNING,
Missouri Univ., Columbia, Department of Agricultural Economics.
Oscar R. Burt.
Florida Univ, Institute of Food and Agr Sci, Water Research Needs: An Economic Appraisal, Pub No 3, pp 75-85, Dec 1967. 11 pp, 17 ref.

Descriptors: *Linear programming, *Dynamic programming, *Systems analysis, Water resources development.
Identifiers: Economics, *Mathematical studies, Planning.

Three optimization techniques were discussed, mathematical (linear) programming, dynamic programming, and simulation. Mathematical programming is comprised of an objective function of several variables which is maximized subject to a set of constraints on the variables. The mathematics of dynamic programming permit estimation of conditional decision rules or strategies that optimize an expected value criterion function. The only requirement is that the dependence relationship of the process be markovian from stage to stage (time period to time period). Simulation is used as a device to calculate an observation on the objective function for given magnitudes of certain decision variables. Given the decision variables, the objective function is a random variable whose probability distribution is specified in the simulation model. The ultimate objective of the research is to explore the mean of the objection function as it is related to the decision variables. The applicability of the three optimizing techniques to water resource problems was also discussed. (Grossman-Rutgers)

WHEN IS IT SAFE TO EXTEND A PREDICTION EQUATION -- AN ANSWER BASED UPON FACTOR AND DISCRIMINANT FUNCTION ANALYSIS,
Department of Agriculture, Forest Service, Berkeley, California.
James R. Wallis.
Water Resources Research, Vol 3, No 2, pp 375-384, Second Quarter 1967. 10 p, 2 fig, 5 tab, 10 ref, 2 append.

Descriptors: *Estimating equations, *Forecasting.
Identifiers: *Linear discriminant function, *Uncertainty categories, Factor analysis, Prediction, Stepwise procedures, Relevance.

Prediction equations for hydrologic events developed from one population of observations (Watersheds) are often solved for another population that is removed either in time or in space. Predictions of this kind are never certainties, although some predictions are obviously more uncertain than others. This paper proposes an empirical uncertainty classification that may be found useful for separating probably successful from probably unsuccessful extensions of prediction equations. The classification system is illustrated by a prediction equation for suspended sediment discharge developed from some watersheds in California, and by a discriminant function for marine versus nonmarine sediments based upon microelements. AUTOCORRELATION AND SPECTRAL ANALYSIS IN HYDROLOGY,
Pittsburgh Univ., Pittsburgh, Pennsylvania.
Rafael G. Quimpo.
Proc Amer Soc Civil Eng, J Hyd Div, Vol 94, No HY2, pp 363-373, March 1968. 11 p, 4 fig, 23 ref, 2 append.

Descriptors: Time series analysis, Markov processes, Fourier analysis.
Identifiers: *Autocorrelation, *Spectral analysis, Correlogram, Spectral density, Boise River, Serial correlation coefficients.

Forty years of daily flow records of a river are analyzed using autocorrelation and spectral

techniques. The two methods of analysis are compared relative to costs or effort and extracted information. For statistical prediction, autocorrelation is shown to be more economical. The discriminatory power of the spectral density function, which allows the detection of noncommensurable harmonics, did not carry much weight for the time series studied. A reduction in calculations can be achieved by examining the behavior of the correlogram only in the vicinity of suspected periods. In modeling, autoregressive techniques may be readily extended to the multivariate case. The intended use of the results is also a factor in the choice of methodology in data analysis. OPTIMIZATION OF THE OPERATION OF A MULTI-PURPOSE RESERVOIR BY DYNAMIC PROGRAMMING,
California Univ, Los Angeles.
Warren A. Hall, William S. Butcher, and Austin Esogbue.
Water Resources Research, Vol 4, No 3, pp 471-477, June 1968. 7 p, 3 fig, 4 ref.

Descriptors: *Dynamic programming, *Multiple-purpose reservoirs, *Optimum development plans, Prices, Optimization, Reservoirs, Linear programming, River systems, California, Constraints, Risks, Planning.
Identifiers: Multiple-river systems, Shadow prices, Objective function, Maximum return.

A technique of analysis is presented by which the dynamic operation policies for planning complex reservoir systems producing hydroelectric power and providing water can be optimized for the maximum return from firm water, firm power, dump water, and dump power. The technique provides for complex constraints, such as mandatory flood control reservations variable in time, fish, wildlife, and recreational releases, navigation minimum flows, etc., as well as evaporation losses and interbasin diversions. The paper presents in detail the operational analysis of a component reservoir-river system and the procedure to be used to combine optimally a number of such sub-systems into a coordinated, mutually reinforcing, multiple-river system. FACTOR ANALYSIS IN HYDROLOGY - AN AGNOSTIC VIEW,
IBM Watson Research Center, Yorktown Heights, N Y.
James R. Wallis.
Water Resources Research, Vol 4, No 3, pp 521-527, June 1968. 7 p, 3 tab, 23 ref, 1 append.

Descriptors: Regression analysis.
Identifiers: *Factor analysis, *Antifactor analysis, Predictors, Reduced rank regression, Varimax rotation, Model building.

It is suggested that factor analysis, if used in the classical manner, will never be of great value for hydrologic analysis. However, factor analysis used as a numerical procedure for screening variables and building effective regression equations is a useful and powerful tool for hydrologic analysis that can be expected to yield equations that outperform others when they are used as predictors for control samples. (Seneca-Rutgers)

TOTAL MANAGEMENT OF WATER RESOURCES,
American Water Works Assoc, New York.
R. L. Smith.
J Amer Water Works Assoc, Vol 59, No 4, pp 1335-1339, Nov 1967. 5 p.

Descriptors: *Future planning (Projected), Federal government, State government, Political aspects, Social aspects, Planning, *Water utilization, Water resources development, Administration, Water management (Applied).
Identifiers: *Total management.

The author explores the concept of 'total management' as it relates to water development. He points out the need for total management in all areas connected with water. Before total management can come about, however, there must be a new organization established to administer it. The structure of the organization must be based on economic, institutional, jurisdictional and hydrologic conditions. Total management must be oriented toward planning, responsive to subjective values as well as to purely environmental factors, careful to avoid commitment to possibilities that may not materialize, and continually in search of new technology.

SCALING OF ATTITUDES TOWARDS WATER CONSERVATION,
Florida Univ., Gainesville, Department of Sociology.
George A. Watkins.
OWRR Project No. A-010-Fla., Master of Arts Thesis, December, 1968. 101 pp, 18 tab, 17 ref, 4 append.

Descriptors: *Attitudes, Water conservation, *Socioeconomic variables, Water use, Appliances, West Palm Beach, Fla., Education.
Identifiers: *Scalogram analysis, Non-parameteric statistics, Factor analysis, Guttman scale, Urban families, Water resources problems.

An attitudinal scale was developed that might be useful to social and natural scientists and to civil engineers concerned with the water resources problem. Carried out as part of the Water Resources Research Project at the University of Florida, the data utilized were collected by interviews with 313 residents of Palm Beach County, Florida. The interview schedules elicited specific socioeconomic information and attitudes, the latter within four subuniverses. Using the technique of Guttman scalogram analysis, the scale had an acceptable coefficient of reproducibility. To validate the four subuniverses, the attitudinal items were subjected to a factor analysis. The scale scores were then compared with the socioeconomic variables using the techniques of the Spearman rank correlation of coefficient and the Kruskal-Wallis one-way analysis of variance. Such a comparison revealed, using null hypotheses, the nature of the relationship between respondents' attitudes and their actual involvement in the water resources problem. (Author)

A WATER RESOURCE MODEL,
Stanford Univ, Palo Alto, California.
Frederick S. Hillier, and Gerald J. Lieberman.
Introduction to Oper Res, Holden Day, Inc, pp 423-425, 1967. 3 p.

Descriptors: *Markov process, Multipurpose reservoirs, Mathematical model, Linear programming.

A mathematical model was presented for a hypothetical multipurpose dam. The basic assumption made was that the probabilities of inflows into the reservoir constitute a Markov chain with positive recurrent states which belong to one class. By taking advantage of the steady state properties of this statistical process, a solution to the optimal release policies was suggested. Stochastic linear programming was suggested as one applicable technique for solution. (Gablinger-Cornell)

SIMULATION TECHNIQUES FOR DESIGN OF WATER-RESOURCE SYSTEMS,
Maynard M. Hufschmidt, and Myron B. Fiering.
Simulation Tech Design Water-Resource Systems, Harvard Univ. Press, Cambridge, Mass., 1966. 212 p, 51 fig, 14 tab, 42 ref, 2 append.

Descriptors: *Simulation analysis, Water resources development, *River basin development, Synthetic hydrology, Benefits, Costs, Digital computers, Monthly, Annual, Streamflow, Evaluation, *Economic efficiency, *Computer models, *Comparative benefits, Design.
Identifiers: Lehigh River system, Delaware River system.

The methodology of simulation was presented and applied to models of the Lehigh and the Delaware River systems. Alternative designs, such as structure sizes and target output levels were treated as input variables, which were arranged in various combinations. Hydrologic sequences were generated in order to economically test the performances of alternative designs. System costs and benefits, including economic losses arising from output deficits, were computed. Results were summarized in terms of net benefits for various interest rates and schedules of development. The methods were illustrated by an application to an actual case, the Lehigh River. The problems of model validation were discussed. An extension of the simulation technique developed for the Lehigh to the larger Delaware system was reported. Fortran routines and study results were shown in figures and tables. (Gysi-Cornell)

Identifiers: Newton-Raphson method, Geometric programming, Dual variable.

The role of the digital computer in the planning and management of water utilities was discussed, and several hypothetical examples of programming methods were presented. The Newton-Raphson technique was used to solve for the flows in a simplified hydraulic network. A linear programming model of a production process was developed to find the optimum output for a manufacturer. The importance of the dual variables was discussed, and the dual problem was structured for the above example. The theory of geometric programming was summarized and applied to the design of a sedimentation basin. An example of a water-meter replacement program solution using dynamic programming was given. Procedures and results of the

LIBRARY U. OF I. URBANA - CHAMPAIGN

examples were demonstrated in tables and figures. (Gysi-Cornell)

TOWARDS ECONOMIC EVALUATION OF WATER QUALITY IN IRRIGATION,
Harvard Univ, Cambridge, Mass; Colorado State Univ, Ft. Collins.
D. Yaron, and E. Bresler.
Proc Int Conf Water For Peace, Washington, D C, Pap P/654, May 1967. 12 p, 2 fig, 1 tab, 13 ref.

Descriptors: *Linear programming, Salt balance, *Water quality, *Evaluation, Irrigation water, *Irrigation efficiency, Salinity, Chlorides, Salt tolerance, Soil properties, Marginal return, Leaching, Evapotranspiration, Soil water optimization.
Identifiers: Marginal substitutuion rate.

A linear programming model was developed and used to find the optimal combination of irrigation water quality and quantity. State variables, such as initial salt concentration of the soil, evapotranspiration rates, depth, and bulk density of soil layers, were assumed given. The salt concentration of irrigation water was the decision variable to be maximized, subject to maximum soil chloride concentration levels, and a continuity salt balancing constraint for the soil. The problem was repeatedly solved for various given irrigation rates. The results of a hypothetical example were tabulated and graphed. The individual solutions when plotted gave an 'iso-soil-salinity' curve for a maximum allowed soil salt concentration. It was concluded that the optimum point on the curve was that point where the marginal rate of substitution of water salinity for quantity just aqualled the unit cost rates of quantity increase to quality increase. (Gysi-Cornell)

AN INVESTIGATION OF ALTERNATIVE MEANS OF ACHIEVING WATER QUALITY OBJECTIVES,
Oregon State Univ, Corvallis.
Kenneth D. Kerri.
Ph D Thesis, Dept Civ Eng, Oregon State Univ, Corvallis, June 1966. 177 p, 26 fig, 23 tab, 47 ref, 3 append.

Descriptors: *Comparative costs, Computer programs, Dissolved oxygen, Coliforms, Economic efficiency, Constraints, Flow augmentation, Mathematical models, *Water quality control, Reservoir storage, Regression analysis, Waste assimilative capacity, *Waste dilution, *Waste treatment.
Identifiers: Non-linear programming, Willamette River Oregon.

Non-linear programming techniques were used to find the minimum cost of achieving various water quality objectives in the Willamette River Basin in Oregon. The objective of the study was to test the hypothesis that 'the waters of the Willamette are too costly for pollution abatement'. An analytical model consisting of two digital computer programs was developed. The minimum cost for removal of a certain quantity of BOD was obtained from a 'DO cost of treatment' matrix. That solution was inserted in the Streeter-Phelphs oxygen sag equation to predict the DO profile for the river. Regression analysis was used to compute costs of meeting coliform standards, and to determine costs of flow augmentation for waste dilution. All the studies were combined to find the minimum cost of treatment and storage to meet various quality standards and flow levels. Results in the form of the hypothesis acceptance or rejection were shown in tabular form. (Gysi-Cornell)

MANAGEMENT MODELS FOR WATER RESOURCE SYSTEMS,
Cornell Univ, Ithaca, N Y.
Daniel P. Loucks.
Tech Rep 1, Cornell Univ Water Resources Center, June 1967. 130 p, 18 fig, 8 tab, 241 ref.

Descriptors: Estimated benefits, Flow augmentation, *Linear programming, Probability, Economics, *Reservoir operation, River regulation, Seasonal, Stochastic processes, Mathematical models, *Water management (Applied), Water resources, *Water allocation (Policy), Optimization, Constraints, Oxygen sag.
Identifiers: Loss functions, Suboptimization.

Deterministic and stochastic linear programming models were structured and used to determine the reservoir releases and the allocations of water to each flow and stock use that meet some management objective. Three objectives incorporated into the model were: (1) max total expected net benefits; (2) min total expected net losses; and (3) min total expected deviation from each use's 'target' (if no economic benefit-loss data was available). Two deterministic linear programming models for water quality management were discussed. The models indicated the minimum cost required to maintain particular DO standards within the system, and the increase in costs resulting from any social, legal or administrative constraints. It was suggested that partial water quality control could also be achieved through appropriate allocations of water for wastewater dilution and transport. Extensions of the models and some economic implications were presented in the appendix. (Gysi-Cornell)
W69-00348

OPTIMUM OPERATION OF A MULTI-RESERVOIR WATER SUPPLY SYSTEM,
Stanford University, Stanford, California.
Reuven Amir.
Program in Eng Econ Planning, Stanford Univ, Rep EEP-24, May 1967. 129 p, 15 fig, 30 ref, 2 append.

Descriptors: Dynamic programming, *Reservoir operation, *Water supply, Water demand, Water costs, Water allocation (Policy), Variable costs, Stochastic processes.
Identifiers: Principle of Optimality.

A mathematical model for reservoir operation using the principle of optimality of dynamic programming was presented. A system of dams and conduits was assumed to exist. The inflows were assumed to be stochastic. Water demand was assumed a predetermined function of time. The objective was to avoid excess demand, considering the costs of shortage and operation. The decision variables were either reservoir levels or changes in reservoir levels. The state variables were the time left for the operation of the system, the amount of water stored in the reservoirs, and all the past inflows. The problem was analyzed as a single reservoir and as a generalized multi-reservoir system. Optimal policies were obtained under various simplified cost assumptions. (Gablinger-Cornell)

A SYSTEMS ANALYSIS OF THE LOWER GANGES-BRAHMAPUTRA BASIN,
Harvard Univ, Cambridge, Mass.
Peter Rogers.
Pap, UNESCO Int Symp on Floods and Their Computation, Leningrad, Aug 15-22, 1967. 26 p, 3 fig, 4 tab, 8 ref.

Descriptors: Systems analysis, Linear programming, Decision making, *River basin development, *International waters, Negotiations, Hydroelectric power, Irrigation, Salinity, Water policy, Navigable rivers, Flood control, Political constraints, Benefits, Optimum development plans.
Identifiers: India, East Pakistan, Ganges-Brahmaputra Basin, Game theory, Screening model.

A deterministic linear programming model was structured and used as a preliminary screening model of the Lower Ganges-Brahmaputra River Basin. The objective was to maximize the net returns from hydropower production and irrigation, subject to flood control, salinity, navigation system capacity and continuity constraints. The model was solved several times using adjustments on the constraint set to reflect various international policy decisions that could be considered by India and East Pakistan. The solutions to the various alternatives were then considered within the framework of game theory. The results were shown as a payoff matrix and as a geometrical representation of a co-operative two-person non-zero-sum game. It was concluded that the techniques of systems analysis could aid in determining guidelines for negotiation on river basin development at the international level. (Gysi-Cornell)

AN OPTIMIZATION METHOD FOR BRANCHING MULTISTAGE WATER RESOURCE SYSTEMS,
Texas A and M University, College Station; University of Texas, Austin.
W. L. Meier, Jr., and C. S. Beightler.
Water Resources Res, Vol 3, No 3, pp 645-652, Third Quarter 1967. 8 p, 6 fig, 11 ref.

Descriptors: *Dynamic programming, River systems, Optimization, Planning, Mathematical models, Water resources, Correlation analysis, *Reservoir operation.
Identifiers: Serial systems, Branching.

Dynamic programming was used to structure a planning model of branching multistage nonserial water resources systems. Maximum return was obtained by decomposing the nonserial river basin system into equivalent serial systems. The use of this method involved introduction of a cut state at the junction between the branch and serial chain. The state variables were the cut states and the reservoirs storages, the decision variables were the releases from the reservoirs. A hypothetical example was solved. (Gablinger-Cornell)

Daniel P. Loucks.
Amer Soc Civil Eng Proc, Vol 93, No SA 1, pp 25-39, Feb 1967. 15 p, 9 fig, 7 ref, 2 append.

Descriptors: Stochastic processes, Standards, Correlation analysis, Water policy, Digital computers, Diffusion, Dissolved oxygen, Economic efficiency, *Waste storage, *Mathematical models, Oxygen sag, Probability, *Risks, *Sewage treatment, *Evaluation, Water quality control, Design flow, Oxygen requirements, Constraints.
Identifiers: Probabilistic model, Transition probabilities, Plant design.

A Markov model was developed to predict, for any particular consecutive-day period, the probability of having less than any specified dissolved oxygen concentration downstream from a waste water treatment plant. The model allowed for both serial and cross correlation between average daily stream and sewage flow conditions. From the probabilities provided, the risk of violating of any stream standard or effluent standard could be determined. The probabilistic model was illustrated using a hypothetical example. Results of the model, including the effect of effluent storage on the cumulative probability distribution of minimum DO concentrations were shown. It was shown that the variability

of a stream's waste assimilative capacity might be used to advantage by means of effluent storage. Computer flow diagrams for determining the maximum allowable BOD concentration in a stream and for solving the model were appended. (Gysi-Cornell)

WATER QUALITY MANAGEMENT,
Univ of Oklahoma, Norman.
George W. Reid.
Water and Wastes Eng, Vol 4, No 11, pp 50-51, Nov 1967. 2 p, 1 fig.

Descriptors: Flow augmentation, Future planning (Projected), Input-output analysis, Mathematical models, Systems analysis, Water demand, *Water management (Applied), Water pollution, Water pollution treatment, *Water quality control, Stream improvement.
Identifiers: Nutritional chemicals, Persistent chemicals.

A brief history of some water supply shortage problems was given, and the use of pollution abatement as a first step towards increasing water supplies was suggested. Some of the fundamentals of water pollution were presented, including the various types of pollution usually encountered. Five equations that can be used for estimating required waste water treatment and streamflows for five different types of pollutants were given. The equations would be used as input-output transformations and would be integrated into a system and analyzed. A mathematical model for a single discharge waste and receiving stream was diagrammed. It was proposed that the approach to the solution of water resource availability be directed toward an optimal combination of waste treatment and low-flow augmentation from storage. (Gysi-Cornell)

A LEAST COST EVALUATION OF DISPOSAL SYSTEMS FOR LOW LEVEL LIQUID RADIOACTIVE WASTES,
Harvard Univ., Cambridge, Mass.
Walter O. Spofford, Jr., and Harold A. Thomas, Jr.

Oper Res Disposal Liquid Radioactive Wastes in Streams, Harvard Water Resources Group, Part 2, Dec 1967. 33 p, 7 fig, 5 tab.

Descriptors: *Radioactive waste disposal, Analytical techniques, Diffusion, *Economic efficiency, Liquid waste, Evaluation, Cost analysis, Mathematical models, Parametric hydrology, Reservoir storage, River flow, Waste water treatment, Waste storage, Water treatment, *Water quality control.
Identifiers: *Lagrange multipliers, Deterministic models, Steady state.

Lagrange multipliers were used in the analysis of a simplified waste handling and treatment scheme on stream. Deterministic steady state stream flows were assumed. The objective was to minimize the sum of the costs at an upstream waste treatment plant and a downstream water treatment plant. The water quality produced by water treatment plant was constrained to be greater than some value. The decision variables were the various combinations of efficiency for each of the plants, and the state variables were the physical and hydrologic parameters. Two examples, with and without assumed reservoir storage, illustrated the use of the model. Important concepts of systems analysis such as: (1) optimal economic design; (2) problem identification; (3) error analysis; and (4) optimal allocation of funds for future data collection were illustrated and discussed. One of five chapters in 'Operations Research in Disposal of Liquid Radioactive Wastes in Streams.' (Gysi-Cornell)

QUEUEING THEORY AND RESERVOIR DESIGN,
Harvard Univ, Cambridge, Mass.
Peter Watermeyer, and Harold A. Thomas, Jr.
Proc Harvard Symp Digital Computers and Thier Appl, Ann Comput Lab Harvard Univ, pp 59-76, Apr 1961. 18 p, 5 fig, 14 tab, 16 ref.

Descriptors: *Markov processes, *Reservoir operation, Reservoir design, Multiple-purpose reservoirs, Benefits, Linear programming, Optimization, Computers.

Stochastic linear programming was used to obtain an optimum operating policy connecting reservoir drafts with initial storages and flows. The objective was to maximize the expected value of benefits associated with various target drafts in various periods, subject to probability constraints. Serial correlation of the inflows was assumed and illustrated in probability matrices. The decision variables were the joint probabilities of an initial storage, inflow, and draft for any period. Two hypothetical examples illustrated the use of the model. The first example assumed one period per year, one benefit, and three possible flows. The second example assumed two periods per year, four possible flows, and three possible benefits. Results of the examples were shown in tabular form. (Gysi-Cornell)

A MODEL FOR DESIGNING WATER DISTRIBUTION PIPE NETWORKS,
Harvard Univ, Cambridge, Mass.
Ramachandran Pitchai.
Harvard Water Resources Group, Ph D Thesis, Harvard Univ, June 1966. 324 p, 42 fig, 25 tab, 79 ref, 9 append.

Descriptors: Digital computers, Design criteria, Design flow, *Distribution systems, *Economic efficiency, Estimated benefits, Estimated costs, Discount rate, *Hydraulic design, *Mathematical models, Pipes, *Network design, Pumping, Statistical methods, Water distribution (Applied), Water demand, Hydraulic properties.
Identifiers: *Non-linear integer programming, Sensitivity analysis.

Non-linear integer programming was used to find the optimum (least cost) design for the pipes in a water distribution system. The objective function to be minimized included pipe costs and the present value of annual pumping costs (both functions of the pipe diameters). The constraint set consisted of pipe friction formulas, Kirchoff laws, minimum permissible and commercially available pipe sizes, maximum permissible head losses, and pump characteristic curves. The network balancing algorithm was based upon the Newton-Raphson convergence method. Sequential random sampling techniques were applied to test system designs in the 'neighborhood' of an original 'reasonable' design. The use of a probabilistic approach for benefits was recommended. A sensitivity analysis on all the model parameters indicated that benefit and cost coefficients played an important role, and further research in their precise evaluations was recommended. (Gysi-Cornell)

TECHNIQUES FOR FINDING RESERVOIR OPERATING RULES,
Harvard Univ, Cambridge, Mass.
George Kenneth Young.
Ph D Thesis, Div Eng Appl Phys, Harvard Univ, Nov 1966. 89 p, 13 fig, 8 tab, 24 ref, 3 append.

Descriptors: *Dynamic programming, *Reservoir operation, Synthetic hydrology, *Simulation analysis, Markov processes, Streamflow forecasting, Optimization, Water allocation (Policy), Stability, Digital computers, Statistical methods, Water management (Applied), Regression analysis, Probability.
Identifiers: Target drafts, Loss function, *Deterministic, *Forward looking.

A deterministic, forward looking dynamic programming algorithm, together with hydrologic simulation, and regression techniques to find the optimal operating policy of a single reservoir. The objective was to minimize the sum of economic loss resulting from draft rates missing the target flow for an assumed maximum reservoir capacity. Other dynamic programming algorithms (backward-deterministic, and forward-and backward-stochastic) were discussed. A Gaussian lag-one Markov model was used to simulate inflows. The effect of the number of years studied on the first year draft decision was investigated. Optimal policies were obtained for various hypothetical loss functions. The policies were inferred by studying sequences of allocations resulting from the algorithm operating on simulated inflow sequences. A flow forecast model was derived, and used to investigate the value of inflow forecasts. It was concluded that the model was efficient for the objectives defined. (Gysi-Cornell)

6B. Evaluation Process

SOUTHWESTERN JEFFERSON COUNTY, KENTUCKY, FLOOD CONTROL PROPOSAL.
U. S. Army Corps of Engineers, Washington, D. C.

U. S. 90th Congr, 2d Sess, House Doc No 340, 80 p, 1968. 2 plate, 1 attach, 4 append.

Descriptors: *Recreation facilities, *Flood control, *Cost-benefit analysis, *Kentucky, Floods, Flood damage, Flood plains, Levees, Design criteria.
Identifiers: *Jefferson County, Kentucky, Louisville area, Flood Control Act.

Flooding in southwestern Jefferson County, Kentucky, was investigated and a plan for construction of local flood protection works, including an impoundment with recreational facilities, is presented. The area covers 41 sq miles of the Ohio River flood plain downstream from and contiguous to the existing flood control works of Louisville. Property worth $256,100,000 is in the overflow area. Future developments having a value of $409,300,000 are projected to 1975 without flood protection. Average annual flood damage now is $239,300. Levees and walls are the only practical flood protection. The planned works include an earth levee and a short concrete wall supplemented by 2 pumping plants and an 810 acre impoundment. The impoundment will be developed for recreation. Total first cost is $20,700,000, of which $14,050,000 is federal. Annual charges are $1,015,000 and benefits are $2,143,000, yielding a benefit-cost ratio of 2.1:1. Most of the annual benefits are recreational. (Knapp-USGS)
W69-00085

CLEAR CREEK, TEXAS, FLOOD CONTROL PROPOSAL.
U. S. Army Corps of Engineers, Washington, D. C.

U. S. 90th Congr, 2d Sess, House Doc No 351, 55 p, 1968. 1 plate, 1 attach, 4 append.

Descriptors: *Flood control, *Channel improvement, *Texas, Cost-benefit ratio, Floods, Flood damage, Design flood.
Identifiers: *Clear Creek, Texas, Flood Control Act, Spoil disposal.

Flood control plans for Clear Creek, Texas, about half way between Houston and Galveston, are presented. The 250 sq mi watershed of Clear Creek basin slopes from 70 to 5 ft above sea level. Parts of the cities of Houston, League City, Pearland, Friendswood, Brookside Village, and Webster are within its flood plain. Present flood control measures are not adequate. Floods result from intense local thunderstorms, general storms, and torrential hurricane rainfall. The value of property in the floodplain is $23,774,000. Based on growth projections, physical property values are expected to increase to about $427 million by 2070. A standard project flood under existing conditions of development would cause damages of $5,532,000; annual

LIBRARY U. OF I. URBANA - CHAMPAIGN

average damage is $578,000. The only feasible solution is channel enlargement and rectification to protect against the 100 yr flood. First cost is estimated to be $18,900,000 of which $12,600,000 is federal, and the benefit-cost ratio is 2.9. (Knapp-USGS)

COMPETITION FOR RECREATION WATER IN CALIFORNIA,
U. S. Army Engineer District, Sacramento, Calif.
Amalio Gomez, and Dale A. Crane.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR3, Pap 6109, pp 295-307, Sept 1968. 13 p, 2 fig, 3 tab, 5 ref.

Descriptors: *Multiple-use projects, *Reservoirs, *Recreation facilities, *Reservoir operation, *Water allocation (Policy), *California, Cost comparisons, Cost-benefit ratio, Water rights, Public benefits, Federal Project policy.
Identifiers: *Recreation water, *Water competition, Public demand, California Water Code.

Tremendous growth in recent years of water-oriented recreation has brought about great demand for minimum recreation pools and adequate facilities at reservoir projects. Water pools for recreation require acquisition of water to fill them initially and to compensate for added evaporation losses later. Such requirements are highly competitive with other established uses. This difficult problem was satisfactorily solved in 4 Federal reservoirs in a water-deficient area in California. Procedure used required a high degree of cooperation by water users, public at large, and construction agency. Required water for recreation was estimated at less than 0.5% of natural stream flow. Total cost, including storage, water, recreation facilities, and maintenance and operation is estimated at $0.30 per recreation-day. Under Public Law 89-72 about one half of this cost would be borne by the Federal Government and the other half by a local agency. Local costs can be financed through user fees. (Lang-USGS)

WATER NEEDS IN 1999,
Horner and Shifrin, Cons. Engr., St. Louis, Missouri.
Vance C. Lischer.
ASCE Journal of the Urban Planning and Development Division, Vol 93, No UP1, Proc Paper 5061, pp 13-20, Jan 1967, 8 pp.

Descriptors: Energy conversion, Plumbing, *Waste water disposal, *Water utilization, *Water re-use, *Resources, *Supply.
Identifiers: Forecasting, Conservation.

The paper is an expression of the writer's observations of trends in technology and water use by people and industry. It deals with these with respect to water and waste disposal practices which are expected to have an impact on water needs in 1999 and on the manner in which these needs are satisfied. Predictions into the future must recognize advancing technology, but must take into account that water-use habits are often tradition-bound, and are not always rational. (Grossman-Rutgers)

INSTITUTIONAL CONSTRAINTS AND ECONOMIC OPTIMA - A BASIS FOR MANAGEMENT DECISIONS IN INTRAREGIONAL WATER TRANSFER,
California Univ., Berkeley, California Agricultural Experiment Station.
C. Dick Detwiler.
Land Economics, Vol 44, No 2, pp 173-184, May 1968, 12 p, 17 ref.

Descriptors: *Water management (Applied), Pumps, Ground-water, Overdraft, *Water allocation (Policy), Legal aspects, *Political aspects, Cost-benefit analysis.
Identifiers: Economics, *Water transfer, *Institutional constraints.

This analysis emphasized the evaluation of political-institutional processes, legal structures, administrative techniques insofar as they effect the water economy. The ground-water overdraft problems of the Salinas Valley of California was the focal point of the analysis. A positive corrective action was called for, but the existing physical, institutional, and political environment of the area presented a strong constraint upon the efficiency implication of an optimal water policy. A traditional solution based on economic analysis of costs and benefits had to be qualified since: (1) an inefficient solution may be judged socially superior to an economically efficient solution, (2) the traditional solution does not consider the effect of private and social interests, (3) costs associated with overdrafting a ground-water reservoir are nonseparable, and (4) a traditional solution implicitly assumes control over all variables. A solution within a modern water context may entail one or more of the following schemes: (1) efficiency aspects: adjudication, (2) pump tax, and (3) equity aspects. (Grossman-Rutgers)

WATER RESOURCE PLANNING IN NORTH CAROLINA.
North Carolina State Dept. of Water Resources, Raleigh.

North Carolina Dept. of Water Resources, Raleigh, N.C. July 1964, 214 pp, 11 illus, 15 tab, 41 ref, 1 append.

Descriptors: Political aspects, State governments, Water management, *Water supply, *Pollution abatement, Recreation, Flood damage.
Identifiers: North Carolina Department of Water Resources.

Included in this report is a comprehensive survey of water resources planning; an inventory of existing plans, a generalized projection of short, medium and long range program needs, and a preliminary blueprint of some planning guidelines for the future. Outlined in detail are the economic background and population trends, with a discussion of their impact on water resources for the future. A review of existing water resource programs in North Carolina in pollution abatement, water supply recreation, flood damage protection and the organization and administration of the programs is discussed, along with a detailed explanation of their functions. The financing by local, state and federal government is reviewed. After this specific discussion of North Carolina water resource planning, there is a general discussion of the role of planning in water resource development. Water resource planning and trends in other states are reviewed. In conclusion, recommendations for future water resource planning with organization for implementation are given. (Gargola-Chicago)
W69-00173

INTERGOVERNMENTAL RESPONSIBILITIES FOR WATER SUPPLY AND SEWAGE DISPOSAL IN METROPOLITAN AREAS.
Advisory Commission on Intergovernmental Relations.

Advisory Comm. on Int. Relations, Report No. A-13, Wash., D.C. Oct. 1962, 135 pp., 5 tab, 72 ref, 2 append.

Descriptors: Economies of scale, Water rates, Political aspects, Water quality control, State jurisdiction, Water allocation, Legislation.
Identifiers: Multipurpose vs. single purpose.

Discusses the problems of urban water quality and quantity, regional variations, and the difficulties of balancing and adjusting varying governmental interests. Local water problems of inadequate investment, failure of individual systems, and the fragmentation of this public function are examined in detail. Various metropolitan approaches are given; arguments for a comprehensive plan include the economics of scale, equalization of water and sewer rates, and fewer unwise investments. Considered then are the political realities in relation to these approaches; the difficulties of the multi-purpose approach are discussed in comparison with the easily implemented single-purpose plans. The state's role in urban water planning is reviewed in the areas of allocation, regulation, facilitation and development. Concerning governmental involvement, suggestions for the role of the federal government in quality and quantity control are given. It is decided that the problems of water resource management are more governmental than technical; ten suggestions for future developments, with plans to implement them are then given. In conclusion, models for acts - State Water Resources Planning and Coordination Act, and Control of Urban Water Supply and Sewerage Systems are suggested. (Gargola-Chicago)
W69-00174

ROANOKE VALLEY REGION WATER RESOURCES PLAN.
Howard, Needles, Tammen and Bergendorf.

Roanoke Valley Regional Planning Comm, Dec. 1967, 90 p, 38 plat, 90 tab, 24 ref.

Descriptors: Land-use, Water supply, Waste disposal, Urbanization, Economic resources, Non-structural alternatives, Financing.
Identifiers: Roanoke Valley, Va., Roanoke, Va.

This comprehensive regional plan provides the framework for solving the immediate and long range water and sewerage problems of the Roanoke Valley Region. The plan is based on certain relevant considerations of population, and its relation to topography, land use and zoning. Existing sources of water are reviewed, with the conclusion that existing facilities will no longer adequately serve the region by 1975. Possibilities of new sources are explored. Under the proposed plan, distribution of water would be accomplished by means of an inner and outer loop system which would center on the city of Roanoke. Construction of a dam, water treatment facilities, transmission pipe lines, and major distribution lines with sewerage treatment works form the bulk of the proposed plan. A Regional Water and Sewer Commission or similar organization is proposed which would administer, maintain and develop the facilities. A plan of bond financing is outlined for acquiring and constructing the system. (Gargola-Chicago)
W69-00175

WATER FOR ILLINOIS: A PLAN FOR ACTION.
Illinois State Gov't., The Technical Advisory Committee on Water Resources.

The Technical Advisory Committee on Water Resources, State of Ill., March 1967, 452 pp, approx. 170 fig, approx 150 photo, approx. 100 tab, 73 ref.

Descriptors: Water sources, Water supply, Pollution abatement, Recreation, Water law, River basin planning, Navigation.
Identifiers: Illinois, Bellwood, Ill., Bloomington-Normal, Ill., Carbondale, Ill., Chicago, Ill., Joliet, Ill., Decatur, Ill., Lombard, Ill., Peoria, Ill., Pekin, Ill., Moline, Ill., Urbana-Champaign, Ill., Madison County, Ill.

Contained in an overall, comprehensive discussion of Illinois water resources, economy, and population trends. A discussion of water supply and use with case studies in Illinois is given. Of the studies, most significant as an example of metropolitan development is the Chicago study. Here a history of

water supply and ownership is given and pollution problems and their present solutions are discussed. The advantages of the lake and problems of pollution abatement are reviewed and suggestions for a further improved water supply are given. Also discussed are the problems of urban occupance of agricultural levee districts. Plans for water based recreation in Illinois are outlined with suggestions for future developments and possibilities for funding from state, local, and federal sources. The ways and means through which the State and its subivisions, assisted by federal aids, meet their responsibilities in water resource management is defined. A review of organization and funding in other states is done. Navigation and river basin planning are discussed and suggestions for future developments proposed. (Gargola-Chicago)
W69-00176

WATER RESOURCES IN THE RFF PROGRAM,
Resources for the Future, Washington, D. C.
Allen W. Kneese.
In Resources for the Future, Washington, D. C., March 1964, 70 p.

Descriptors: Discount rate, Cost-benefit analysis, *River basin development, *Recreation, *Water supply, *Decision making, Water pollution, Flood damages, Political aspects.

Provided is a general background of programs and studies being carried on in pollution, river basin development, recreation, water quality, public interest in water resources and increased water supply. A general review of works published in these areas is also included. Outlines of areas needing study are suggested with plans for allocation of funds to them. A review of studies of particular benefit/costs associated with water resource development and use is given: (1) water quality aspects of recreation value-with studies under way or completed; (2) aspects of water quality in relation to salinity, treatment, and stream flow regulation; and (3) control of flood damages. Following is a discussion of system optimization and other general problems of decision making in the public interest. Some of the specific problems examined are: (1) geographical extent of the water resources planning and operating unit; (2) discounting for the future; and, (3) uncertainty of outcomes of public investment. Discussed are the ways political decisions and optimization analysis might be facilitated. General studies of policy issues and the role of the political process in water development is reviewed. Case studies underway in relation to the abovementioned areas are reviewed. (Gargola-Chicago)

METROPOLITAN PLANNING AND RIVER BASIN PLANNING: SOME INTERRELATIONSHIPS,
Water Resources Center, Georgia Institute of Technology, Atlanta.
Guy J. Kelnhofer, Jr.
Office of Water Resources Research, project B-009-GA, July 1968. 231 p, 13 fig, 6 tab, 229 ref.

Descriptors: *Metropolitan planning, *River basin planning, Metropolitan water management, Metropolitan areas, *River basin development, Metropolitan resources development, Georgia, Coordination, *Public development attitudes, Project planning, Decision making, Urbanization, Resource allocation, Public interest, Federal projects, City planning.
Identifiers: *Atlanta metropolitan area, *Chattahoochee River, Metropolitan planning agencies.

The relationships that exist between the planning of river basins and the planning of metropolitan areas in the management, use and development of water resources are examined. How, and the extent to which metropolitan area governments participate in decisions for water resources use and development in their regions is discussed. Attention is focused on the important aspects of the problem of planning for water resources management and use in metropolitan areas. Most metropolitan areas were found to be handicapped because no one metropolitan government is authorized to represent the metropolitan area and negotiate with river basin interests; and usually, there is no river basin management agency with whom metropolitan representatives could negotiate. Significant changes that could be made in local, State and Federal water planning procedures are suggested that, if implemented, metropolitan areas would have more and better control over the development and use of their water resources. Contains 229 references. (Water Resources Center-Ga Tech)

NORTHERN CALIFORNIA'S WATER INDUSTRY,
Resources for the Future.
Joe S. Bain, Richard E. Caves, and Julius Margolis.

In Johns Hopkins Press, Baltimore, Md., 1966, pp 1-17, 8 ref.

Descriptors: Water values, *Water supply, *Pricing, Water rates.
Identifiers: Northern California, *Theory of market, *Market models.

An 'industry study' takes as its frame of reference the structural taxonomy of market models, and is the approach used in dealing with the water supply and demand problem in this study of northern California. Presented is a regional water industry, examining from a clinical point of view its actual structure, conduct and performance. The aim of the study is ultimately that of deriving proposals for public policy affecting development of water resources. In the first stage, adapting the theory of markets, six distinctive features of the water industry are discussed. The second stage identifies important observable elements of the structure or environment of the industry that may have economic significance for explaining the character of its behavior and the quality of its performance. From this, further development of the industry study approach to water problems is outlined. (Gargola-Chicago)

POLICY HORIZONS FOR FUTURE URBAN WATER SUPPLY,
Resources for the Future.
J. W. Milliman.
Land Economics, Vol. 39, pp. 109-32, May 1963 21 pp, 2 fig, 1 tab, 26 ref.

Descriptors: Average price, Average costs, Discriminatory pricing, *Water rates, Unit costs, *Water supply, Marginal costs, Marginal benefits, *Peak loads.
Identifiers: Metering, Block rates, *Urban water economics.

Considering its importance, urban water economics does not hold a proper place in the field of water resource management. Three factors are responsible for this: the technology of municipal water supply has not greatly changed in 2000 years; economic costs of urban water supply have been very low in relation to worth; and the area has never been the subject of heated partisan debate. In the future this will change, and certain emerging policy issues will become more important. The role of technology, economics, and political decision-making are discussed, with reference to possible future trends. Problems of metering, price discrimination, block rates, and peak load are surveyed against a backdrop of rising water costs and the need to promote efficient water use. Suggestion for increasing the efficiency of urban water management is given, with a critique of established practices in setting level of water rates. (Gargola-Chicago)

TRI-COUNTY RIVERFRONT STUDY.
Tri-County Regional Planning Commission, Peoria, Tazewell, Woodford Counties, Ill.

Tri-County Regional Planning Commission, Peoria, Ill., Feb. 1968, 85 pp, 21 illus, 2 appen.

Descriptors: Geology, *Land use, Water quality, Watershed, *Future planning, *Water zoning.
Identifiers: Illinois River, Peoria, Woodford, Tazewell, *Riverfront planning.

Because a waterfront can be of great value in stimulating community development and facilitating industry it should be guarded against improper use. This study attempts to explore the Tri-County Illinois River development from two viewpoints; first, the Illinois River in terms of regional significance; secondly, the Tri-County riverfront area in relation to a more immediate geographic area. The physical characteristics and regional uses of the river are discussed. Background data, with implications for planning are outlined, and existing land use reviewed. Barge industry statistics are given with an outline of development in that industry. Guidelines for future development to preserve balance between private uses and public recreation and conservation needs are outlined. Shoreline and water surface conservation emerges as one of the most pressing needs. The present problems of the area reflect future needs, and recommendations are made from these. In conclusion a brief view of other successful waterfront projects is given. (Gargola-Chicago)

COMPETING USES FOR WATER AND OTHER IMPEDIMENTS TO IRRIGATION DEVELOPMENT,
North Dakota State Univ., North Dakota Water Resources Institute.
Thor A. Hertsgaard.
Great Plains Agricultural Council, Publication No 30, pp 23-28, Nov 1967, 6 p, 1 ref.

Descriptors: *Cost-benefit analysis, *Economic efficiency, *Productivity, Prices, Water utilization, Resource development, *Water rights.
Identifiers: *Economics, *Irrigation, *Water demand.

Water resource development projects are chosen on the basis of the benefit-cost ratio of the projects. Further, the outlay for the projects is warranted up to the point where marginal resource cost equals the marginal revenue product of the outlay. The problems of this method of project selection are discussed. If pure competition existed in a water resource market, then the market mechanism would allocate the water so that the marginal value product of water would be identical in all the uses of the water. Thus, the economic efficiency of water use would be maximized. The competition for water is not pure, so the market-price mechanism is not economically efficient. The alternative method of allocation is by use of water rights. This two has proven to be economically inefficient. Information needed to guide the choice of uses of water that will be consistent with maximum economic efficiency is given in the paper. (Grossman-Rutgers)

RIVER BASIN PLANNING AND URBAN DEVELOPMENT,
Georgia Inst. of Tech., Atlanta, Georgia, School of Architecture.
Guy J. Kelnhofer, Jr.
ASCE Journal of the Urban Planning and Development Division, Vol 93, No UP4, Proc Paper 5619, pp151-161, Dec. 1967 11 pp.

Descriptors: *Community development, Federal Government, Coordination.
Identifiers: *Planning, *River basin development.

LIBRARY U. OF I. URBANA - CHAMPAIGN

The coordination of river basin planning and metropolitan planning are important. Planning for river basin development should be brought under a unified command. The common objectives and plans of metropolitan areas must be based on a consensus. The increasing Federal emphasis on metropolitan planning and the creation of river basin planning agencies are two promising trends in the development of closer coordination in the planning of river basins and metropolitan areas. (Grossman-Rutgers)

IRRIGATION IN THE FUTURE,
Leeds, Hill and Jewett, Inc., Cons Engrs, San Francisco, California.
Harvey O. Banks.
ASCE Journal of Urban Planning and Development Division, Vol 93, No UP1, Proc Paper, pp 41-55, Jan 1967. 15 pp, 1 map, 5 tab, 10 ref.

Descriptors: *Projections, Federal Government, Federal Reclamation law, *Water policy, Resources.
Identifiers: Irrigation programs, *Future planning (Projected).

Projections of need for irrigated agriculture in the next 50 years were calculated for three areas. For California, irrigated acreage is projected to increase by one-third; in Texas, to more than double; and in the Erie-Niagara Basin, of western New York State, to increase nine times. For these projections it was assumed that water will be available at prices within irrigator's payment capabilities. Also, technological advances were postulated. Future irrigated agriculture probably will not be able to pay the full cost of supplying irrigation water. The continuing need for subsidy must be recognized and a uniform nation-wide policy should be adopted by the Federal Government. The price for irrigation water from Federal projects should be high enough to encourage efficient use. Acreage limitation provisions of Federal Reclamation law should be modernized to promote efficient agriculture. (Grossman-Rutgers)

FRAMEWORK FOR ANALYSIS OF IRRIGATION DEVELOPMENT,
Oklahoma State Univ., Stillwater, Department of Agricultural Economics.
Vernon R. Eidman.
Great Plains Agricultural Council, Publication No 30, pp 90-102, nov 1967. 13 p, 1 fig, 14 ref.

Descriptors: Water rights, *Farm management, *Linear programming, Water allocation (Policy), *Water resources.
Identifiers: Economics, *Irrigation.

The maximization of the long run social welfare of the community is the dominant goal in water resource use. The optimum allocation of the available water supply on a farm is when the marginal value product of the water applied is equal in all of its uses and greater than or equal to the marginal cost of obtaining the water. Farm management research should be part of the broader framework of macro level studies and decisions. One method of research is to select the geographic boundaries of the study area and analyze the resource problems within the chosen area. Such tools as linear programming and aggregation techniques may then be used. An alternative model would be a simulation model in which variables are estimated by probability distributions and then various decisions are evaluated. (Grossman-Rutgers)

SURFACE WATER RESOURCES PLANNING IN HUDSON BASIN,
Tippetts-Abbett-McCarthy-Straton, Consulting Engrs., New York, N. Y. and Div. of Water Resources, N. Y. State Conservation Dept., Albany, N. Y.
Gerald T. McCarthy, and Nicholas L. Barbarossa.
ASCE Journal of the Hydraulics Division, Vol 94, No 2, pp 375-389, March 1968. 15 p

Descriptors: Hydraulics, New York, Planning, River basin development, Water resources, Water supply, Hudson River, Reservoir sites.
Identifiers: Mohawk River Basin, Water Resources Commission of the State of New York.

A reconnaissance study was made by the consultants for the Water Resources Commission of the State of New York. The objective was to evaluate the quantity and general quality of the ground water and surface water resources within the Hudson-Mohawk River Basin and Long Island. The study assesses the present utilization, analyzes and projects the water needs within a 15,000 sq. mile area, with a present population of 13,000,000 persons, to the year 2020. The entire study area was screened for potential reservoir sites and suitable storage projects were located in the headwater regions. The techniques used to screen potential reservoir sites are described and are believed to have wide application to water resource planning for large river basins. Alternative solutions are developed for municipal water supplies for four regions: (1) Upper Hudson River Basin; (2) Mohawk River Basin; (3) Lower Hudson River Basin; and (4) New York City, West Chester County and Long Island. Special attention is given to water supply problems of New York City and vicinity. The plans presented show relative costs of a number of alternative solutions. (Seneca-Rutgers)

THE SOCIAL VALUE OF WATER RECREATIONAL FACILITIES RESULTING FROM AN IMPROVEMENT IN WATER QUALITY: THE DELAWARE ESTUARY,
Resources for the Future, Inc., Washington.
Paul Davidson, F. Gerard Adams, and Joseph Seneca.
In Water Research, Johns Hopkins Press, Baltimore, 1966, pp 175-211, 37 p, 4 fig, 4 tab, 22 ref.

Descriptors: *Delaware River, *Recreation facilities, *Water quality, *Cost-benefit analysis, Social values, Swimming, Fishing, Boating, Probability, Supply, Benefits, Costs.
Identifiers: *Water recreation, *Water recreational facilities, *Delaware Estuary, Social benefits, Social costs, Market failure.

After analyzing the causes for the failure of markets to provide for outdoor water recreational facilities, the authors performed a benefit-cost analysis of the recreational value of Delaware River water quality improvement. Data from a Public Health Service study was used to estimate a total cost of water quality improvement function. A survey conducted by the Michigan Survey Research Center provided the data for the estimation of empirical relationships between a sizable number of socioeconomic characteristics and the recreational use of water for boating, fishing, and swimming. Projecting the size and characteristics of the population, the demand and marginal benefit functions for water recreation were estimated through 1990. From these estimates an approximation of the optimal level of water quality improvement for recreation was estimated. (Seneca-Rutgers)

A CASE STUDY IN INCOME REDISTRIBUTION FROM RESERVOIR CONSTRUCTION,
Kentucky Univ., Lexington
James L. Douglas.
Water Resources Research, Vol 4, No 3, pp 499-506, June 1968. 8 p, 3 tab, 13 ref.

Descriptors: *Reservoir construction, *Flood control, *Economic efficiency, Cost-benefit analysis, Benefits, Costs, Recreation, Taxes, Water resources.
Identifiers: *Income redistribution, *Flood benefits, *Recreation benefits, Objective function, Dewey Reservoir, Weighting factor.

Because water resources investment has been evaluated from the economic efficiency objective, benefit-cost analysis has been criticized as ignoring other goals. Benefit and cost data collected for Dewey Reservoir in the Appalachian Mountains of Eastern Kentucky were used to determine the incidence of benefits and costs among income intervals. Recreation as a project purpose proved more effective in redistributing income than flood control. Weighting the income maximization and income redistribution objectives according to the value judgment that income taxes collected represent equimarginal sacrifice showed income redistribution benefits to equal 18.2% of efficiency benefits. The percentage would be lower in higher income areas. (Seneca-Rutgers)

BENEFIT-COST ANALYSIS: ITS RELEVANCE TO PUBLIC INVESTMENT DECISIONS,
Resources for the Future, Inc, Washington, D. C.
Arthur Maass.
Water Research, Johns Hopkins Press, Baltimore, 1966, pp 311-328, 18 p, 1 tab, 16 ref.

Descriptors: *Cost-benefit analysis, Welfare, Economic efficiency.
Identifiers: *Tradeoff ratio, Public investment, *Redistribution of income, Objective function, Legislative process.

An evaluation of the branch of welfare economics known as benefit-cost analysis is undertaken. The limitation of benefit-cost analysis is that it ranks projects and programs only in terms of economic efficiency. However, the objective of most public programs is not economic efficiency alone, but additional goals such as redistribution of income and the promotion of national self-sufficiency. Thus, benefit-cost analysis may be largely irrelevant. However, both objectives can be accomplished (efficiency and income redistribution for example) if a tradeoff ratio between efficiency and income redistribution is specified. There is a capacity in the legislative process to make tradeoff decisions. However, the field of public investment for which the present benefit-cost technique is most advanced, water resources, is the field for which political technique for determining tradeoffs between efficiency and other objectives is most primitive. Thus, one should combine benefit-cost analysis with an equally sophisticated technique relating efficiency benefits and costs to those stemming from other objectives. The need for changes in the theory of welfare economics is discussed and evidence is provided that tradeoffs can be determined. (Seneca-Rutgers)

FEASIBILITY OF WATER EXPORT,
Manitoba Univ, Winnipeg, Canada.
Edward Kuiper.
Proc Amer Soc Civil Eng, J Hyd Div, Vol 94, No HY4, 873-891, July 1968. 19 p, 5 fig, 1 tab, 6 ref.

Descriptors: *Water supply, Desalination, Irrigation, Pumping, Reservoirs, Rivers, *United States, Water resources, Treaties.
Identifiers: *Canada, *Water export, British Columbia.

This paper reviews the various aspects that are associated with exporting water from one country to another. The general criteria that must be satisfied before export can be contemplated are (1) the exporting country must have a surplus of water; (2) the importing country must have a deficit of water; (3) there must be a mutual advantage in the transfer of water; (4) the two countries must come to an agreement regarding a water export-import treaty. The author describes the application of these criteria to the Canada-United States situation. The continent is divided into three regions: mountain west, prairie, and east. In each region Canada's surplus water in the foreseeable future and the approximate cost of providing it to the United States are calculated. The possibility ap-

pears small that Canadian water export will become economically feasible in the near future. (Seneca-Rutgers)

ENVIRONMENTAL ASPECTS OF RIVER BASIN PLANNING,
North Carolina Univ, Chapel Hill.
Maynard M. Hufschmidt.
Proc Amer Soc Civil Eng J Hyd Div, Vol 93, No HY6, pp 323-333, November 1967. 11 p.

Descriptors: Benefit-cost analysis, *Planning, Environmental effects, Hydraulics, Rivers, Systems analysis, *Water resources, Administrative agencies.
Identifiers: *Environmental quality.

Current methods, substance, and administration of river basin planning in the United States must be changed substantially to accommodate the increasing national concern for problems of environmental quality. Modifications will be required in planning theory: improvement or environmental quality should be adopted as a major national objective, along with currently accepted objectives of economic efficiency and income distribution. Significant changes are also needed in methods of estimating benefits, cost and production functions, and in the planning process and techniques. Systems analysis methods must incorporate many environmental quality parameters, alternative development estimates and management measures. Planning for river basins and for metropolitan areas must be integrated. Important changes required in water resources policy, organization and administration are discussed. Extensive research and experimentation on new methods and approaches are required by research centers and public agencies concerned with water resources and environmental quality problems. THE ECONOMIC VALUE OF REAL ESTATE ACQUIRED FOR RIGHT-OF-WAY,
Kentucky Univ., Lexington.
L. Douglas James.
Land Economics, Vol 44, No 3, pp 363-370, Aug 1968. 8 p, 1 fig.

Descriptors: *Right-of-way, *Land appraisal, Condemnation, *Cost-benefit analysis, Economic justification, Real property.

A method was developed for estimating the personal value (i. e., value to the owner in excess of what he can realize through market sale) of real estate acquired for water resources development based on statistical analysis of data collected from three reservoirs constructed by the U. S. Army Corps of Engineers. The personal value is the product of the relationship developed over time between the owner and his real property and community. Since this value is real to the owner in that it makes him an unwilling rather than a willing seller and since it is lost through forced sale, lost personal value is a legitimate economic cost and as such should be considered in the economic evaluation of public works projects. RESEARCH AND DEVELOPMENT RESOURCE ALLOCATION UNDER RIVALRY,
Michigan Univ, Ann Arbor.
F. M. Scherer.
Quarterly Journal of Economics, Vol. 81, No 3, pp 359-394, August 1967. 36 p, 5 fig, 2 tab.

Descriptors: Research and development, Technology, Theoretical analysis, *Resource allocation, *Competition, Costs, Return, *Profit, Time, Welfare.
Identifiers: Duopoly, Market share, Quality, Innovation.

Taking into account the development schedules of rival firms and assuming a convex tradeoff between total development cost and development time, this article explores several models of inter-firm rivalry in the development of technically advanced new products. Major results include (1) Cournot-type rivalry leads to more rapid development of new products than either monopolized development or joint profit maximization. (2) The deeper the stream of quasi-rents at stake, the shorter are the minimax, joint profit-maximizing and Cournot equilibrium development schedules and the higher are total development costs. (3) In a broad class of cases, firms with relatively small market shares have stronger incentives to innovate rapidly than dominant firms. However, dominant firms accelerate their development efforts when their market positions are threatened by small innovators, and this action may induce a submissive reaction on the part of the smaller firms. (4) Firms are more apt to accelerate their development efforts in response to rival schedule accelerations when technological leadership can confer permanent market share changes.

BENEFIT-COST ANALYSIS AND THE NATIONAL OCEANOGRAPHIC PROGRAM,
Washington Univ, Seattle.
James A. Crutchfield, Robert W. Kates, and W. R. Derrick Sewell.
Also Clark Univ, Worcester, Mass; Victoria Univ, Canada. Natural Resources Journal, Vol 7, No 3, pp 361-375, July 1967. 15 p.

Descriptors: *Oceanography, *Planning, *Cost-benefit analysis, Recreation, Benefits, Fisheries, Weather forecasting, Prices, Allotments, Sewage disposal, United States.
Identifiers: National Academy of Sciences, Opportunity cost.

In 1964, a study by the National Academy of Sciences attempted to estimate benefits stemming from oceanographic research over a ten year period and to compare these estimates with the research cost to provide a basis for planning a national oceanographic program. Three basic conceptual weaknesses are evident in the NAS report: (1) in several places, such as in the valuation of outdoor recreation, benefits have either been calculated in gross terms or opportunity costs have been neglected; (2) the study ignores the impact of additional output on prices; (3) the study makes no attempt to define the appropriate composition of the oceanographic program marginal benefit-cost ratios for separable elements ranging from nearly unity to eight are indicative of a serious imbalance. Besides having conceptual weaknesses, the study has serious errors in its estimates of gross benefits. The authors conclude that while a more sophisticated and conceptually sound benefit-cost analysis of the national oceanographic program would be useful, there remain many areas in which the principal output of the program will continue to be scientific knowledge rather than economic benefits. A purely mechanical application of benefit-cost analysis would be inappropriate. (Seneca-Rutgers)

LAKESHORE PROPERTY VALUES: A GUIDE TO PUBLIC INVESTMENT IN RECREATION,
Wisconsin Univ, Madison.
Elizabeth L. David.
Water Resources Research, Vol 4, No 4, pp 697-707, August 1968. 11 p, 1 tab, 11 ref.

Descriptors: Recreation demand, Recreation, Water quality, Water pollution, *Property valued value, Access routes, Lake shores, Swamps, Topography, Population, Surface waters, Public lands, Water level fluctuations, Wisconsin.
Identifiers: Improvement value, Public investment.

A study of lakeshore property values in which land and improvement values were regressed against attributes of the site and the lake to determine the importance of the various characteristics in predicting property values indicates that swampy or steeply sloped banks are negatively correlated with value. Water quality, proximity to population centers, and the presence of many other lakes in the area are positively related to value. No significant relationships were discovered between land values and the amount of public land in the vicinity or the degree of fluctuation in the lake level. Property values approximately doubled in the ten year period of the study. By suggesting characteristics that seem to be in greater demand, the study provides information to guide some of the decisions about where to spend the limited public budget for waterfront recreational facilities. EXCESS BENEFIT,
Virginia Univ, Charlottesville.
Gordon Tullock.
Water Resources Research, Vol 3, No 2, pp 643-644, Second Quarter 1967. 2 p.

Descriptors: Taxes, *Water pollution, *Effluents, Industrial wastes, Legal aspects.
Identifiers: *Externalities, *Excess burden, Excise taxes, Subsidies.

If some activity imposes an external cost, then a properly calculated tax on it will reduce the total output of the private sector by less than the revenue received by the government. If the external cost is large, it is possible that the government revenue will be 'free.' This means that the private sector will be as large, or larger, after the tax has been paid. This type of excise tax is clearly the most desirable of all taxes. In most water pollution cases the situation is not this clear but it is still true that gains can be made. A tax on the discharge of effluents by industry into a river produces an excess benefit instead of an excess burden. Indeed it seems likely that taxes on sources of water and air pollution would produce quite considerable revenues, while improving general well-being. Such a tax, if completely unaccompanied by subsidies to people who are injured, may not insure optimum utilization of our natural resources, but it will usually be better than raising the same revenues from taxes that carry substantial excess burdens. ECONOMIC EVALUATION OF WATER-ORIENTED RECREATION IN THE PRELIMINARY TEXAS WATER PLAN,
Texas Agricultural Experiment Station and Texas Techonological College, and Texas Water Development Board.
Herbert W. Grubb, and James T. Goodwin.
Texas Water Development Board Rep 84, 28 p, Sept 1968. 4 fig, 3 tab, 7 ref 1 append.

Descriptors: *Cost-benefit analysis, *Recreation demand, *Reservoirs, *Texas, Statistical methods, Regression analysis, Least squares method, Multiple-purpose projects.
Identifiers: Reservoir recreation benefits.

Potential recreation benefits from reservoirs proposed for inclusion in the Texas Water Plan were estimated. Data collected during a 1965 survey of 8 reservoirs were used with population and income data to estimate a recreation visitation prediction equation. A least square regression was fitted to a double logarithmic transformation of the original data. Statistically significant explanatory variables are population, per capita income, cost of travel to reservoirs, proximity of competing reservoirs, and reservoir size. Correlation coefficients, estimated number of visits (1970-2020), and estimated recreational benefits of proposed reservoirs (1970-2020) are tabulated. (Knapp-USGS)

APPROACHES TO WATER RESOURCE DEVELOPMENT IN CENTRAL AND SOUTHERN FLORIDA, 1845-1947,
Florida Univ, Gainesville, Public Administration Clearing Service.
John M. DeGrove.
Studies in Public Administration No. 17, pp 1-53, 1958. 13 p, 1 map, 20 ref.

Descriptors: Drainage programs, Irrigation programs, Hydroelectric plants, Municipal water, Industrial water, Land reclamation, *Water resource development, Multiple-purpose projects, Tennessee Valley Authority Project, Coordination, *Local governments, Long-term planning, Optimum development plans, *Federal government, Project planning.

Acute problems in administration, finance, and inter-governmental cooperation present themselves in an interwoven pattern that defies separate analysis. One of the most complicated and vexing illustrations of policy-administration confusion lies in the area of the economic evaluation of water resource projects. The whole question of the economic evaluation of water resource projects has become a sort of political football in which agencies go through an elaborate mathematical exercise to support the pre-conceived fact that they are best suited to develop the project in question. The necessity of developing any major water project within the framework of a federal system further complicates the inadequacies of federal-state-local organization for dealing with the problem. An almost insuperable handicap in attempts to develop effective cooperative patterns which will allow full utilization of the nation's water resources grows out of the administrative dispersion problem at the local, state, and federal level. The pattern since the 1930's may be characterized as one in which a more or less uncoordinated cooperation between federal and state-local agencies. (R. Smith-Fla)

ECONOMIC AND RELATED PROBLEMS IN CONTEMPORARY WATER RESOURCES MANAGEMENT,
New Mexico Univ., Albuquerque School of Law.
Allen V. Kneese.
Nat Res J, Vol 5, No 2, pp 236-258, Oct 1965. 22 p, 31 ref.

Descriptors: *Water resources development, *Administration, *Water utilization, *Competing uses, Water allocation (Policy), Water policy, Water conservation, Watershed management, Planning, Water quality, Water requirements, Water supply, Recreation, Water values, Water users.

Problems of allocating existing water supplies among competing demands are taking the place of the problem of developing unused supplies. Economic theory has provided a model of efficient resource allocation for planners. Problems of reallocation of water or water transfers and their ramifications, such as effects on third parties, are discussed. There is a growing problem of estimating the value to be placed upon the use of water for recreational purposes. Water quality appears to be the major national water resource problem in the coming decades. Much additional research is necessary in the area of industries affected by, and causing, water pollution. Additional research into control of flood damage is necessary. Inland navigation, its development and use by such activities as large transportation, should be critically analyzed and compared with alternatives such as pipelines. Research toward achieving optimum efficiency from a system is necessary. The comparative evaluation of present and future benefits and costs from public investments such as water resources management systems is discussed. More appropriate methods of handling the risk and uncertainty associated with water resources projects must be developed.

SOME IMPORTANT RESEARCH PROBLEMS IN THE WATER RESOURCES FIELD,
New Mexico Univ., Albuquerque School of Law.
Blair T. Bower.
Nat Res J, Vol 5, No 2, pp 286-297, Oct 1965. 11 p, 10 ref.

Descriptors: *Project planning, Project purposes, Competing uses, *Cost-benefit analysis, Multiple-purpose projects, Administration, Benefits, *Operations research, Water resources development, Project benefits, Analytical techniques.

The article deals with pressing problems of research which will pay off in terms of improved water resources planning and management. The problems of coping with uncertainty stemming from shifting and increasing demands for water and from unpredictable water supplies are discussed. Estimation of hydrologic uncertainty is not the only problem. Flexible water resource systems, analysis of alternative demand patterns over time, changing the end product-time focus of water resources planning, and a system of continuous planning are suggested as procedures for coping with other uncertainties. Study of the relative accuracy of data relating to various types of water resources systems is necessary. Integration is necessary between all authorities dealing with water resources. The problems of planning and developing operating procedures for water resources systems and the evaluation thereof are discussed. Research into the benefits to be derived from various water quality improvements and their value is necessary. Problems such as the relationship between water resources systems and spacial development municipalities, and the benefits from area-wide facilities are discussed.

ORGANIZATIONAL ARRANGEMENTS FOR WATER DEVELOPMENT,
New Mexico Univ., Albuquerque School of Law.
Irving Fox, and Lyle E. Craine.
Natural Resources J, Vol 2, No 1, pp 1-44, April 1962. 45 p, 34 ref.

Descriptors: *Administration, Administrative agencies, Administrative decisions, *Institutions, *Water resources development, Water policy, Water law, *Organizations, Long-term planning, Multiple-purpose projects, Planning, Non-structural alternatives, Optimum development plans, Regional analysis, Political aspects, Social aspects, Physical properties.
Identifiers: *Analytical structure, *Environmental factors.

This paper takes issue with the assumption of many proposals for organizational improvements in water resources activity that the problem is basically one of overlapping functions and bureaucratic ambitions. The purpose of this paper is to suggest an analytical structure that permits consideration of the problem in terms of fundamental environmental factors. The first part attempts to identify, classify and appraise environmental factors which affect the design of institutional arrangements for water development. This part provides an analytical structure composed of four categories of factors: (1) the value system and its requirements for decision making; (2) the characteristics of the function of producing water services; (3) the significance of relationships among the processes of water development; and (4) the general institutional environment. Part Two explores implications of applying this analytical structure to existing problems of water resources organization. In conclusion, it is hypothesized that there are two interrelated parts in the problems of the analytical structure: (1) finding ways of providing organizational arrangements that are capable of maximizing welfare; and (2) finding ways of motivating water development organizations to maximize welfare. Solutions are offered for both parts of the problem.

WATER AND LIFE,
Lorus Milne, and Margery Milne.
Published by Atheneum, New York, pp 1-257, 1967. 275 p, 54 ref.

Descriptors: *Water utilization, *Water conservation, *Water resources development, *Water users, Bodies of water, Hydrologic cycle, Rain, Water storage, Environmental sanitation, Water pollution, Cloud seeding, Dew, Forests, Wetlands, Saline water, Desalination, Animals, Sewage, Industrial wastes, Pesticides.

Chapter 1 describes water as a part of the human body, approximately three-tenths of body weight. Chapter 2 encompasses the world's water ways. Navigation, irrigation, consumption by humans, recreation, and flooding are mentioned. Chapter 3 is devoted to the hydrologic cycle. Emphasis is on precipitation and human consumption statistics, as well as water storage, water pollution and sanitation. A revamping of the sewerage system is called for. Pollution is also the topic of Chapter 5 with emphasis on insecticides and industrial wastes. Chapter 6 covers rain, clouds, and cloud seeding. Chapter 7 examines the characteristics and uses of dew. Chapter 8 covers forests. Wetlands are examined in Chapter 9, i.e., an area where water stands for part of the year but in excess of ten feet deep. Chapter 10 discusses salt water and man's ability to cope with saline water problems. Chapter 11 deals with the ability to survive without water with emphasis on the camel. Chapter 12 covers sea exploration and research including desalination. The remaining three chapters examine various characteristics of water, such as its use in dehydrated foods, beautification by statute, and irrigation projects. (Breuel-Fla.)

MANAGEMENT OF WATER RESOURCES FOR REGIONAL DEVELOPMENT,
Dept. of Agriculture, Economic Research Service.
Harry A. Steele, and William A. Green.
Iowa State University Center for Agricultural and Economic Development, 1966 p 145-65, 9 fig, 22 ref.

Descriptors: Market value, Gross national product, Water use, Precipitation, Water requirement, Water consumption, *River basin development, Water resources development, Project planning, Water supply, *Future planning, Optimum development plans, Interagency cooperation, *Federal project policy, Irrigation programs, Long term planning, Short term planning.
Identifiers: Economic base studies, Development need functions.

Explored is the relation of water resources to economic activities, and the application of economic base studies in the formulation of river basin programs. There exists a complicated interrelationship between land and water, which to a large degree affects the growth of the economy. In an attempt to study this a general review is made of the use of the nation's water supply and regional water resources and requirements. It is suggested that investigations be conducted to ascertain pertinent physical and economic information, and that this data be used to form technical and factual guidelines for national water policy. Two major types of investigational efforts are being carried out. The first includes regional studies of water resource problems, while the second deals with selected sub-basin areas. Development-need functions of water resource development are shown with a general outline of necessary elements for the study of drought and irrigation. Potential for water resource development is reviewed and in conclusion a summary of problems and issues is given. (Gargola-Chicago)

PUBLICATIONS IN OPERATIONS RESEARCH NO. 3: (ESTABLISHING CRITERIA FOR WATER RESOURCES PROJECTS),
Rand Corporation Research Study, Santa Monica, Calif.
Roland McKean.
Operations Research Society of America, John Wiley and Sons, Inc., 1968, p 103-127, 7 tab, 7 ref.

Descriptors: *Cost-benefit ratio, Discount rate, *Annual benefits, *Annual costs, Assessments, Capital, Capital supply, Cost-benefit analysis, Market value, Intangible benefits, Intangible costs, Net profit, Operating costs.
Identifiers: Net worth, Time streams, Ratio of present values, *Internal rate of return.

Argued is the validity of examining benefit-cost estimates for government projects with a discussion of difficulties in applying benefit-cost analysis to given projects. The limitations of ratios of annual benefits to annual costs is reviewed. It is concluded that the significant factor is profit on investments or prospective change in present worth; in measuring only gross benefits to costs, certain projects will not be properly assessed. In fact, benefit-cost ratios may be an inherently incorrect criterion for water resource projects. Possible discount rates, another problem of applying benefit-cost analysis, with special time preferences are reviewed. A method for ranking alternatives is outlined, considering that interdependent projects cannot be separately ranked. Although no single test can point clearly to the set of projects that is optimal, guidelines can be indicated and sources of error avoided. (Gargola-Chicago)

DEVELOPING AND MANAGING THE WATER RESOURCES OF N.Y. STATE.
New York State Water Resources Comm., Divison of Water Resources.

N.Y. State Water Resources Comm, Div. of Water Res, Albany, N.Y., 1967, 53 p, 14 fig, 24 photo, 3 tab, 1 chart.

Descriptors: *Water resources development, Interstate commissions, Long-term planning, *Multiple-purpose projects, Municipal water, Water demand, Water management, Recreation demands, Water quality control, Water supply, Navigation, Flood control, *Resource allocation, *Optimum development plans, Flood control, *Reservoir sites, *Reservoir operations, Climatic data.
Identifiers: New York, N.Y. State Water Res. Comm., Susquehanna River Basin, Oswego River Basin.

A review of problems in recreation, lake management, water quality, water supply, flood control, and other areas is given in brief summary for the entire state. To aid in the solution of these problems a general plan is put forth, with the primary objective of providing a framework within which the optimum allocation of water resources can be found. Suggestions for implementing the plan, through coordination of public and private interests are presented. Possible sources of financing on the state and local levels are discussed. The first step of the plan is the reservation of reservoir sites which is the substance of the program. Suggestions for additional action in development and management, which could follow, are given. The state is divided into three regions and the physical characteristics, economic aspects, climate, water supply, and water demand problems of each area outlined. Suggestions for reservoir sites are given with pertinent data for the most promising sites. (Gargola-Chicago)

A BENEFIT-COST ANALYSIS OF LOCAL WATER SUPPLY,
Louisiana State Univ, Baton Rouge, Economics Dept.
W. J. Stober, and L. H. Falk.
Land Economics, Vol. 39, No. 4, pp 328-335, Nov. 1963, 7 p, 1 fig, 1 tab, 5 ref.

Descriptors: *Benefit-cost analysis, Benefit-cost ratio, Economies of scale, Capital costs, Interest rate, *Cost comparisons, Average costs, Tax rate, Diseconomies of scale, Annual benefits, Interest rate, Water development, Municipal water, Water management.
Identifiers: *Public investment.

The problem of a community faced with a shortage of water for industrial and municipal use is examined. Two courses of action; a private project financed by industry, and a community project, publically financed, are considered within the framework of a benefit-cost analysis. The cost measurement of each is put forth, and in the comparison the community project emerges as the most economical. This conclusion is a direct result of the corporate income tax structure. A lower cost of capital to the community than to corporate water users has the effect of increasing the benefit-cost ratio. Although a community project is beneficial to the community, it can violate efficiency conditions for the National economy. (Gargola-Chicago)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

COMPUTERIZED LOCATION MODELS FOR ASSESSING THE IMPACT OF WATER RESOURCE PROJECTS,
Washington Univ., St. Louis, Missouri. Institute for Urban and Regional Studies.
Edgar M. Hoover.
In Impact of Water Resources Development on Economic Growth, Working Paper CWR 1, 55 pp, 2 fig, 35 tab.

Descriptors: *Computer models, *Computer programs, Resource allocation, Cost comparisons, Economic efficiency, *Economic evaluation, Economic feasibility, Unit costs, Operating costs.
Identifiers: *Location models.

One of the necessary operations in the overall cost-benefit appraisal procedure is to determine how the national location pattern of an industry would be affected by specified reductions in costs of materials extraction, cost of processing, costs of transportation, or material requirements per unit of product. Water resource projects could affect any of these factors. The programs contained in the report are designed to evaluate and measure possible effects. Program I determines the optimum pattern of outputs, shipments and sales for the industry and measures its efficiency in terms of total output and average delivered price. Geographical position, costs of producing the material at each source, cost of processing the material at each production location, amount of material required per unit product, parameters of transport cost functions, parameters of demand at various markets are inputs of the program. The procedure followed by the program and impact evaluations are then discussed. Six programs which follow are supplemental variants on the basic program and evaluate the impact of certain single variables. (Gargola-Chicago)

NORTHERN CALIFORNIA'S WATER INDUSTRY,
Resources for the Future.
Joe S. Bain, Richard E. Caves, and Julius Margolis.

In Resources for the Future, Johns Hopkins Press, Baltimore, Md. 1966, pp 347-363, 1 tab, 15 ref.

Descriptors: Water demand, Pricing, *Water rates, *Economic justification, *Marginal costs, Discriminatory pricing, Operating costs, Unit costs.
Identifiers: San Francisco Bay Area, Northern California.

Price differentials are employed in the sale of municipal water supplies outside the city. Various reasons are given for this, but none seem totally justified; the pricing structures seem to rest upon faulty analysis. Components of an urban water pricing schedule should include: (1) a fixed charge per period of time, and (2) a quantity charge which covers only incremental operating costs. Unfortunately these principles, and others discussed, are not followed by most municipal pricing systems. Demand and quantity prices which are charged, and arguments for these practices are reviewed. Discrimination through special rates, practiced by many municipal districts, is shown to promote a distortion of water allocation among classes of urban consumers, resulting in prices too low to reflect the long run marginal costs of the typical system. (Gargola-Chicago)

ON THE MARGINAL COST PRICING OF MUNICIPAL WATER,
New Mexico Univ., Albuquerque.
Gilbert W. Bonem.
Water Resources Research, Vol 4, No 1, pp 191-193, February 1968. 3 p, 1 fig, 4 ref.

Descriptors: *Marginal costs, *Pricing, *Municipal water, Water supply, Average costs.
Identifiers: *Spillover effects, Social benefits, Social optimum, Net benefits, Third party benefits.

It has been maintained that municipal water supply should be priced so that marginal cost equals price. However, there are likely to be 'third party' benefits from some components of municipal water use, primarily from the use of water for landscaping and gardening. Because gardening affects the quality of the urban environment, social benefits may exceed private benefits, and marginal cost pricing may result in a price that exceeds a socially optimal price. The magnitude of divergence of the marginal cost price from the optimal price will depend primarily upon the size of the 'third party' benefits. (Seneca-Rutgers)

DISCOUNTING AND PUBLIC INVESTMENT CRITERIA,
Resources for the Future, Inc., Washington.
Kenneth J. Arrow.
In Water Research, Johns Hopkins Press, Baltimore, 1966, pp 13-32, 20 p, 37 ref.

Descriptors: *Discount rate, *Interest rate, *Risks, Capital, Investment, Benefits, Costs, Optimization, Taxes, Financing.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Identifiers: *Public investment, *Economic growth, *Imperfect capital markets, Public capital, Private capital, Utility.

The investigation deals with the problem of appropriate discount factors to be applied to the expected streams of benefits and costs generated by public investments. Theoretical problems related to general interest rate questions are discussed. Among them are the problems of imperfect capital markets, the interest rates implied by the growth of per capita consumption and the natural growth rate, the interest rate implications of public investment financing through taxation and borrowing, and the relationship of risk and uncertainty to the level of the appropriate interest rate. Among other things, the paper concludes that public investment policy should be based on a 'myopic rule' (that the present value must be positive), that optimal public investment policy with imperfect capital markets implies two rates of interest (one for private capital and one for public), and that the public sector should not make allowances for risk in choosing among investment alternatives. (Seneca-Rutgers)

THE CALIFORNIA WATER PROJECT: IS PUBLIC DECISION MAKING BECOMING MORE EFFICIENT,
Washington Univ., Seattle, Washington.
Gardner Brown, Jr.
Water Resources Research, Vol 4, No 3, pp 463-470, June 1968. 8 p, 27 ref.

Descriptors: *California, *Discount rate, Efficiencies, Water supply, Risks, Benefits, Elasticity of demand, Desalination, Prices.
Identifiers: *Water project, *Opportunity costs, Investment alternatives, California Water Project, Alternative sources.

It is argued that the use of an incorrect discount rate, the application of procedures that overestimate net benefits, and the failure to charge a scarcity price for water are inappropriate arguments against the value of the California State Water Project. However, the existence of alternative public investment opportunities and technological progress in desalination are two factors to which the State may have given inadequate attention. As a consequence, although the State's water pricing policy encourages more efficient resource allocation than that of the federal government, there are plausible grounds for believing that further improvement is possible. (Seneca-Rutgers)

OPERATIONS RESEARCH APPLIED TO ENGINEERING PLANNING,
Tennessee Technological University, Cookeville.
Albert A. Cannella.
Water and Sewage Works, Vol 115, No 7, pp 310-314, July 1968. 5 p, 7 fig, 9 ref, 1 append.

Descriptors: *Linear programming, *Operations research, *Project planning, Interest rate, Growth rates, *Water distribution (Applied), Water districts, Economic efficiency, Optimum development plans, Digital computers, Costs, Pumping, Design.

Some techniques of Operations Research were applied to a hypothetical water distribution cost minimization problem. Two phases of the problem were treated individually. The Phase I problem was to determine the main trunk line sizes between demand centers in a water district in order to minimize pumping costs. Center to center unit pumping costs were given. A linear programming method was used to find the optimal line routing. The Phase II a non-linear mathematical model was structured and used to find the optimum design periods based on projected demand growths that minimized expansion outlays. The capital outlay, a function of amortization and maintenance cost factors, interest rate, population growth rate, and planning period, was differentiated with respect to the planning period. An iterative process performed on a digital computer was used to solve the resulting equations to find the optimal design period. (Gysi-Cornell)

SENSITIVITY ANALYSIS OF ACTIVATED SLUDGE ECONOMICS,
Stanford Univ, Stanford, Calif.
Bernard C. McBeath, and Rolf Eliassen.
Amer Soc Civil Eng Proc, Vol 92, No. SA 2, pp 147-167, Apr 1966. 21 p, 5 fig, 4 tab, 8 ref.

Descriptors: *Activated sludge, *Economics, Analytical techniques, Biochemical oxygen demand, *Design criteria, Digital computers, Oxygen requirements, Biodegradation, Economies of scale, *Evaluation, Mathematical studies, Optimization, *Waste treatment, Economic efficiency, Sludge treatment, Sanitary engineering.
Identifiers: *Sensitivity analysis.

The sensitivity of cost of an activated sludge treatment system to some of the parameters used in its design was tested. The activated sludge process was described in terms of the effects of waste character treatment rates and construction and operational costs. The sensitivity analysis was performed on a computer using first a substitution of values method and then a pair by pair graphic display of cost response to parameter changes for parameters identified as critical. It was concluded that the procedure offered a means of parametric study for the purpose of describing some optimal characteristics of the system, as well as some means of identifying those characteristics. However, it was stated that the procedure gave optimal solutions only when the appropriate parameters were examined within the proper limits. (Gysi-Cornell)

6D. Water Demand

LUESSE V WEBER (USE OF LAKE SURFACE).

350 S W 2d 424-432 (Mo 1961).

Descriptors: *Non-navigable water, *Navigable water, *Lakes, *Barriers, Ownership of beds, Easement, Water utilization, Fishing, Riparian rights, Riparian lands, Water law, Legal aspects.

The plaintiff and the defendant are each owners of laud under and abutting a lake near the Mississippi River. The defendants have a pontoon bridge across the lake on their land. The plaintiff brought suit to have the bridge removed as an obstruction to navigation. The court avoided the question of whether an owner of land covered by a lake artificially raised was entitled to the use of the entire surface of the lake. They held that the lake was not a navigable body of water and that the lake had been divided into portions for the defendant and the plaintiff for 50 years thereby amounting to an acquiescence on the part of the plaintiff. Such acquiescence bars the plaintiff from asserting any right to injunctive relief. (Horner-Fla)

THE LAKE SUPERIOR WATERSHED UNIT.
Minnesota State Department of Conservation.

Minnesota Conservation Department Bulletin 24, February 1966, 61 pp, 9 fig, 2 map, 12 tab, 31 ref.

Descriptors: *Small watersheds, Geology, Topography, Surface water, Ground-water, Water quality, Water pollution.
Identifiers: Lake Superior, Nemadji river, Lake County, Minn., Cook County, Minn., St. Louis County, Minn., St. Lawrence Seaway.

Described are the water resources and water problems of the Lake Superior watershed unit. This unit is an elongated area which extends for 160 miles along the north shore of Lake Superior. A history of the area, with a review of climate, geology and topography, is given. The economic importance of the mineral resources, soils and forests of the unit are discussed. Reviewed then are the added advantages brought by the St. Lawrence Seaway to the Duluth-Superior harbor, and the potential for future development. General streamflow characteristics are defined and compared; low flow and floods are also discussed. The quality of both ground and surface water is measured, and the problem of water pollution discussed. Individual sewage systems contribute to ground water pollution, but by far, industrial wastes comprise the major source of pollution. In conclusion, the advantages and problems of the watershed unit are summarized. (Gargola-Chicago)
W69-00180

SUMMARY OF PRESENT PRACTICES IN EVALUATION OF WATER RESOURCE PROJECTS,
Washington Univ., St. Louis, Missouri. Institute for Urban and Regional Studies.
Raymond J. Struyk.
In Impact of Water Resources Development on Economic Growth, Working Paper CWR 13, 40 pp, 14 ref.

Descriptors: Project planning, *Cost-benefit analysis, Discount rate, Pollution abatement, Net profit, Alternative costs, Direct benefits, Indirect benefits, *Cost analysis, *Methodology, *Economic evaluation.

A statement of methods used in estimating future water demands of population, industry, and agriculture with an outline of water quality control and pollution abatement measures is given. The criteria by which flood control needs and recreation resources are examined is reviewed. Project formulation is carried out on the basis of an examination of the above factors, and preliminary study and elimination of alternatives is then done. Net worth and alternative worth of each project is compared. Further elimination of alternatives is then carried out. Primary benefits of each project, in water quality and supply, recreation, and fish and wildlife, are evaluated. Various approaches to the calculation of these benefits are examined. The evaluation of secondary benefits is then discussed in conjunction with this. General measurement procedures in cost analysis and the derivation of economic costs are discussed. Methods of progressive refinement and narrowing of the field of choice; screening of alternatives, order of merit approach, sub-basin approach, and functional approach, are given in brief summary. (Gargola-Chicago)

NORTHERN CALIFORNIA'S WATER INDUSTRY,
Resources for the Future.
Joe S. Bain, Richard E. Caves, and Julius Margolis.

In Resources for the Future, Johns Hopkins Press, Baltimore, Md., pp 179-191, 1966.

Descriptors: *Water demand, *Elasticity of demand, Pricing, Water rates.
Identifiers: Northern California, San Francisco Bay area.

Domestic or residential, public, commercial, and industrial use form the major components of urban water use. The determinants of urban demand are those factors which affect the above uses; included are climate, precipitation, income per capita, price per unit and other environmental conditions. Each

component of urban water use is affected by these factors to a greater or lesser degree. It is difficult to gain statistical evidence to assess the relative importance of these factors for many reasons. Cities do not state separately quantities of water demanded by different users. It is difficult to reveal the response of components of urban demand to change or difference in price of water, which is necessary for learning the elasticity of demand for water. Elasticity of demand plays an important part in any economic study and can hold considerable significance for both the performance and conduct of the water industry. From this a discussion or pricing, water rates, and interrelationships of the above factors is given. Low, but significant, elasticities of demand for water are supported, a conclusion which has importance in considering the pricing systems used by urban agencies which supply water. (Gargola-Chicago)

WATER FOR OREGON,
U. S. Geological Survey.
K. N. Phillips, R. C. Newcomb, and H. A. Swenson, et al.
Geological Water-Supply Paper 1649, 1965, 150 pp, 47 fig, 35 ref.

Descriptors: Topography, Water table, Water quality control, Flooding, *Water supply, *Water management, *River basin development, Water allocation.
Identifiers: *Oregon river basins.

The rate of flow, quality of water, topography and groundwater resources of Oregon's river basins are discussed. The severest and most common water problems result from the annual cycle of precipitation and runoff, causing dry streams in the warmer months and occasions of flash flooding in the rainy season. Protection against floods should lie in the proper location of towns rather than protective construction while in the dry season pumping of water from distant sources may be necessary. Problems of water purity and pollution are then discussed with suggestions for future development. Although demand is expected to increase as population grows, Oregon should have enough water to supply these demands. It is possible to double or triple the present water supply, and other sources might be developed if necessary. In conclusion, resources to meet future needs are discussed and four basic principles of water resource management put forth. (Gargola-Chicago)

THE WATER ECONOMY AND ITS ORGANIZATION,
New Mexico Univ., Albuquerque School of Law.
Vincent Ostrom.
Natural Resources J, Vol 2, No 1, pp 55-73, April 1962. 19 p, 2 ref.

Descriptors: *Water Allocation (Policy), *Competing uses, Administrative agencies, Non-consumptive use, Consumptive use, *Water resources development, *Planning, *Multiple-purpose projects, River basin development, Water utilization, *Area redevelopment, Interstate, *Tennessee Valley Authority Project, *Columbia River Basin, Hydroelectric plants, Utilities.

Goods and services that are derived from a water supply system can be allocated both by the private market and by the public economy. For a good to be amenable to allocation in the market, it must be 'packageable,' meaning it can readily be purchased or sold in the market economy. Those not willing to pay for the packageable good can be excluded from enjoying its benefits. Most consumptive uses or goods qualify for the exclusion principle. But most in-the-channel or consumptive uses do not qualify for the exclusion principle. The interdependency and competition among water uses militates for a multi-purpose approach. Experience with the Tennessee Valley Authority and in the Columbia Basin has shown that a single integrated agency cannot develop comprehensively the resources of a water supply system. A rich and complex system of organization, including a variety of both public and private agencies is needed to gain intelligence, recognize the interdependency among uses, and to mediate the conflicts between competing developers and users.

STATUS OF WATER RESEARCH IN THE UNITED STATES,
Roland R. Renne.
J Am Water Works Ass'n, Vol 60, No 7, pp 749-754, July 1968, 6 p.

Descriptors: Research development, Water resources development, Technology, Grants, Economics, Government finance, Long-term planning, Budgeting, Economic justifications, Federal government, Government finance, Legislation, Standards, Future planning.

There are six types of water problems in the U S: pollution, inadequate supply, uneven distribution, floods, variability of supply and demand, and water treatment. To meet the problems new legislation has launched a 3-way attack of research, planning and development, and quality control. However, too often the tendency is to short change basic research for the future and limit the research funds only to present problems. Federal expenditures for water research have doubled in the past 3 years however this is only 2.5% of federal expenditures for research. The Fed. Council for Science and Technology recommends that research funds be near the $200,000,000 by 1971. This requires an increase of 20% per year in order to achieve this goal. There are now 38 federal agencies involved in some aspect of water resource activities. One of the key agencies for water research is the Water Resources Scientific Information Center now operating from the Office of Water Resources Research. In looking to the future there are at least eight possible approaches to solving water problems: (1) water treatment, (2) reuse, (3) restricted or curtailed use, (4) use classifications, (5) improved management of watersheds, (6) desalting, (7) weather modification, (8) importation from other areas. (Kirk-Fla)

EFFECTS OF COMPETITION ON EFFICIENCY OF WATER USE,
Utah State Univ., Dept. of Civil Engineering, Logan.
Jay M. Bagley.
J Irri and Drainage Div (ASCE), Vol 91, No IR 1, pp 69-77, March 1965. 9 p.

Descriptors: *Water utilization, Arid climates, *Legal aspects, *Competing uses, Water demand, Institutional constraints, Irrigation efficiency, Administration, *Water allocation (Policy), Hydrologic aspects, Interstate compacts, Economic efficiency, Evaporation control.
Identifiers: Terminology, Flow systems.

Many factors operate to influence the relation between competition for water and its efficiency of use. Careful attention has to be given to definition of boundaries and terminology if meaningful relations were to be obtained in specific instances. An appreciation for the inter-connection of all natural waters together with their variable and mobile characteristics was needed. Recognition of the effect of legal and institutional mechanisms which modify the relation between competition and water use was required also. Specific examples illustrating both favorable and adverse effects of competition on efficiency of water use were given. The efficiency with which water is used in arid regions is particularly important. (Affleck-Ariz)

THE RELATION OF FAMILY INCOME AND USE OF WATER FOR RESIDENTIAL AND COMMERCIAL PURPOSES IN THE SAN FRANCISCO-OAKLAND METROPOLITAN AREA,
California Univ, Los Angeles, Water Resources Center.
Charles J. Headley.
Land Economics, Vol. 39, No. 4, p 441-49, Nov. 1963, 8 p, 5 tab, 4 ref.

Descriptors: Time series, Income analysis, *Elasticity of demand, Water rates, *Water demand, *Municipal water, Water supply, Policy matters, Unit costs, Project planning.
Identifiers: San Francisco-Oakland Metropolitan Area, *Income elasticity, Cross sectional model, Projections.

Defining the determinants of demand for water by urban users is done in a framework which focuses on the relation of family income to demand, holding other variables constant. A time series model and cross-sectional model are used to describe the unique and common features of each of the 12 cities studies. Data on water use, water purchases, and relation to income was gathered and aggregated. From this, projections of the increase in demand are made that are lower than those projected by state agencies. A positive relationship between family income and residential water purchases is demonstrated, while certain differences appear in the elasticity of demand findings of the cross-sectional and time series models. This might indicate under which considerations certain projections should be carried out. In conclusion, it is pointed out that the study is only exploratory and points up many complexities in the entire urban water market. (Gargola-Chicago)

URBAN DOMESTIC DEMAND FOR WATER: A KANSAS CASE STUDY,
Wisconsin Univ, Milwaukee, Wisconsin.
Manual Gottlieb.
Land Economics, Vol. 39, No. 2, pp 204-210, May 1963, 6 pp, 2 fig, 4 tab, 20 ref.

Descriptors: Economies of scale, *Elasticity of demand, Water rates, Water consumption, Pricing, *Regression analysis, *Water demand, *Municipal water, Water requirements, Economics.
Identifiers: Kansas City, Mo., Income elasticity.

Discussed are the demand characteristics for domestic use of purified water produced and distributed by urban water works. Four specific points are reviewed; (1) price variance, (2) price elasticity, (3) effect of price change and (4) multiple regression analysis. It is tentatively shown that price elasticity is related to income elasticities, and that a price change temporarily depresses consumption. The actual price elasticity for water on grounds of National and Kansas data is approximately .4 for large cities and .65 for smaller communities. Because of lack of data for overall National consumption, however, these results cannot be certain. (Gargola-Chicago)

6E. Water Law and Institutions

RONDESVEDT V RUNNING (OWNERSHIP OF ALLUVION).

19 Wis 2d 614; 121 N W 2d 1-6 (1963).

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Judicial decisions, *Wisconsin, Riparian rights, *Accretion (Legal aspects), Water law, Legal aspects, Relative rights, Riparian land.

Plaintiff Rondesvedt and defendant Running both claimed title to the top of a sand point, formed by accretion, which was contiguous only to Rondesvedt's land, but which ran laterally along the shore in front of Running's land. Rondesvedt brought an action to determine title to this land. The court found that if the accretion continued, defendant's access to the deep waters of the lake would eventually be cut off. It then decided that the boundary between the property of Rondesvedt and that of Running should be extended so that it cut across the point and that Running should have title to that portion of the point on her side of the boundary line. On appeal to the Supreme Court of Wisconsin, held, affirmed. The court stated that the general rule that alluvion belongs to the owner of land to which it attaches itself must give away when the rights of other riparian owners would be destroyed by such rule. (R. F. Williams-Fla)

BOLLINGER V HENRY (RIPARIAN RIGHTS ON ARTIFICIAL STREAMS).
375 S W 2d 161-166 (Mo 1964).

Descriptors: Missouri, Judicial decisions, *Artificial watercourses, *Riparian rights, *Prior appropriation, Boundary disputes, Mills, Irrigation water, Reasonable use, Streams, Relative rights, *Ownership of beds.
Identifiers: *Millraces, Adverse possession.

This was an action by owners of a millrace against the owner of adjoining land to quiet title and to obtain an injunction to prohibit the adjoining owner from taking water from the millrace. Several years before this action plaintiffs requested permission from the defendant to alter the millrace. Defendant agreed and a sharp curve in the millrace was eliminated by cutting the millrace through defendant's land. Defendant asserted a right to take water from the millrace at this point. Plaintiffs contended that their use of the millrace was open and notorious for several years and that as such gives them title to the altered section by adverse possession. It was held that plaintiffs had not acquired title to the property, and although the normal rule is that riparian rights do not attach to artificial streams, the rule was altered here. It was held that since the parties had not defined their respective interests in the water, the court could do so, and defendant was allowed reasonable access to the millstream. (Crabtree-Fla)
W69-00005

KLAIS V DANOWSKI (TITLE TO LANDS UNDER THE GREAT LAKES).

373 Mich 262; 129 N W 2d 414-423 (1964).

Descriptors: *Michigan, Judicial decisions, *Riparian rights, *Accretion (Legal aspects), *Boundary disputes, Ownership of beds, Great Lakes, Water law, Boundaries (Property), Eminent domain, Riparian land.

This case involved a purchaser's action on a land contract in which the State intervened. The State claimed that the land in question was part of State-owned, unpatented, submerged lands of the Great Lakes and, as such, was subject to legislation providing that occupants on such land may apply to the State for conveyances of its interests. The defendant claimed that the land was patented and hence the statute did not apply. The court agreed with the defendant. Since the land was patented before Michigan's admission into the Union, the U S had no title to pass at that time. The court also held that title of the riparian owner follows the shoreline; and as to accretions, relictions, avulsions or erosions on the Great Lakes, owners of lands bordering on the navigable waters thereof, patented to their ancestors in title by the U S, gain by what comes through accretions and reliction but do not lose that which they own under patent by erosion or avulsion. The right to acquisitions through accessions or reliction was said to be a riparian right, the taking of which by the State requires compensation. (Patterson-Fla)
W69-00007

PARKER V ADAMSON (ARE SAND SLOUGHS WATERCOURSES).
109 Ga App 172; 135 S E 2d 487-491 (1964).

Descriptors: Georgia, Judicial decisions, Boundary disputes, Boundaries (Property), Low water mark, Navigable waters, Non-navigable waters, Lakes, Streams, Ownership of beds, Perennial streams.
Identifiers: *Sand sloughs.

This was an action to determine the true dividing line between two properties in relation to a sand slough. The central issue was whether or not the slough should be considered non-navigable watercourse or whether it was a lake or pond. The boundary line along a non-navigable stream is the center line and along a lake or pond the boundary line is the low water mark. There was evidence that the sand slough was dry several months a year but had water flowing through it to a river during the rest of the year. It was held that the slough was a watercourse and that the center of the stream was the boundary line. Besides evidence as a perennial flow, the court found a slough to be a side channel of a river, and held that the name given a body of water is a material factor in determining its nature. (Crabtree-Fla)
W69-00008

SCHRODER V BATTISTONI (EASEMENTS TO ERECT DOCKS).

199 A2d 10-13 (Conn 1964).

Descriptors: Connecticut, Judicial decisions, *Prescriptive rights, *Easements, *Docks, Ownership of beds, Lakes, Riparian rights, Recreation, Right-of-water.

This was an action to enjoin interference with plaintiffs' use of docks extending from their property into defendant's lake. Plaintiffs claimed easements to erect and maintain their docks. It was found that their grantor did not intend to convey such an easement, the easements were not necessary for use and normal enjoyment of their lots, and prescriptive rights were not acquired because the dock use was neither adverse nor of sufficient duration. (Crabtree-Fla)
W69-00009

STATE V MAAS AND WALDSTEIN CO. (PRESCRIPTIVE RIGHTS IN NAVIGABLE WATERS).
83 N J Super 211; 199 A 2d 248-254 (1964).

Descriptors: New Jersey, Judicial decisions, Streams, Navigable waters, *Condemnation, *Highways, High water mark, *Ownership of beds, *Eminent domain, Prescriptive rights, Federal-state water rights conflicts, Riparian rights.

This was a condemnation proceeding to acquire a fee simple in a portion of defendant's lands fronting on the bank of a navigable river. Defendant claimed that the land under the river was not subject to condemnation because: (1) since the condemnation was not in furtherance of navigation and the highway department can only condemn such land for that purpose; (2) federal approval must be obtained for such takings; and (3) defendant had a prescriptive right in fee to the land. Each contention was denied. It was held that federal approval had been acquired, the state had power to condemn, and that title by prescription cannot be obtained against public lands. (Crabtree-Fla)
W69-00010

WEAVER V KNUDSON (TITLE TO UNMEANDERED LAKE SHORE LAND).
State of Wisconsin.

23 Wis 2d 426; 127 N W 2d 217-221 (1964).

Descriptors: Wisconsin, Judicial decisions, Shores, Survey, Boundaries (Property), High water mark, Lakes, Riparian land, Ownership of beds, Patents, Navigable waters.
Identifiers: Meander lines.

This was an action to quiet title. The land in question was conveyed by government patent according to the official plat. Plaintiffs were grantees of a certain Lot 7 which was split by a large lake. The land in question was a small piece of land across the lake from most of Lot 7. Defendants claimed that while the official plat included the small piece of land, the lake had not been meandered, and under the system then in effect, the patent should be held to include only the larger part of Lot 7. This result was urged because the government would not have intended to convey two unconnected parcels of land as one Lot. It was held that the Government patent should prevail on its face, and title was quieted to plaintiffs. (Crabtree-Fla)
W69-00014

TRUSTEES OF INTERNAL IMPROVEMENT FUND V TOFFEL (ACCRETION AS IT RELATES TO TITLE).

145 So 2d 737-745 (Fla D C A 1962).

Descriptors: Florida, Judicial decisions, Meanders, *Accretion (Legal aspects), High water mark, *Surveys, Relative rights, *Boundaries (Property), Rivers, Prescriptive rights, Riparian land, Public lands, Navigable waters, Ownership of beds.
Identifiers: *Meander line.

This was an action to quiet title to land along the Peace River. The disputed land was the subject of a federal survey in 1849 and was conveyed by patent in 1856. In 1939 the federal government resurveyed the land and claimed that the 1849 survey was invalid as to 386 acres, the land in issue. Plaintiff claimed that the original survey was substantially correct, and that accretion since 1849 accounted for much of the disputed 386 acres. Plaintiff further claimed that unless the surveys were fraudulent or grossly erroneous, that accretion along the navigable river should be his. Defendants claimed title to the 386 acres by patent from the United States after the 1939 survey. They claimed that the 1849 survey was gross error, and that the land in question was never conveyed by the United States under the original patent based on the 1849 survey. It was that the 1849 survey was valid and that accretion since that date accounted for the 386 acres. (Crabtree-Fla)
W69-00016

GIES V FISCHER (BULKHEAD LINES).

146 So 2d 361-364 (Fla 1962).

Descriptors: *Florida, Judicial decisions, Legislation, Navigation, Cities, *Ownership of beds, *Bulkhead line, Local governments, Condemnation, Riparian land, Public lands.
Identifiers: *Servitudes, Commerce.

This case was a proceeding challenging the constitutionality of Florida Statute 253.122 which authorizes local governments to fix offshore bulkhead lines. The statute was held constitutional. The statute was found to authorize establishment of bulkhead lines only at a point where further outward extension would constitute an interference with the servitude in favor of commerce and navigation. (Crabtree-Fla)
W69-00017

FORD V TURNER (ACCRETION, AVULSION, AND LAND TITLES).

142 So 2d 335-342 (Fla DCA 1962).

Descriptors: Florida, Judicial decisions, Hurricanes, *Accretion (Legal aspects), *Avulsion, *Boundary disputes, Navigable waters, Boundaries (Property), Islands, Prescriptive rights.

This was an action to quiet title to land formed by accretion along navigable water. It was held that such title is in the owner of the land to which there is an accretion. It was further held that subsequent severance by avulsion would not affect the title of non-submerged lands where such title was established prior to the severance. (Crabtree-Fla)
W69-00018

COMMONWEALTH V MAYER (LAKES--LEGAL ASPECTS).
357 S W 2d 879-882 (1962).

Descriptors: *Kentucky, *Lakes, Lake beds, Lake shores, State governments, Riparian land, *Legal aspects, Water law, Reasonable use, Dams, Permits, Water resources, Recreation, Project purposes, Conservation.

Merchant was granted permission by the Commonwealth of Ky to build a causeway across a neck of the lake wholly on state property but connecting a 21 acre tract which he owned on one side to a 45 acre tract owned by his mother on the other side of the lake. It was provided that Merchant should pay for building and maintaining the causeway, that it must be kept open to the public at all times, and it must be built according to county road standards. The Commonwealth owns both the lake and the access area on each side where the causeway in question is being constructed. The trial court held the causeway created a public nuisance and entered judgment ordering the removal of that work which had already been done and permanently enjoining any such project in the future. This court reversed the trial court and held that the fact the appellee's land may be ciminished in value to some extent by the erection of the causeway was not justification of prohibiting its construction. (R. Smith-Fla)
W69-00022

JEFFREY V GROSVENOR (ADVERSE POSSESSION OF RIVER BOTTOM LAND).
157 N W 2d 114-123 (Iowa 1968).

Descriptors: *Ownership of beds, *Accretion (Legal aspects), *Channel flow, Missouri River, *Iowa, Navigable rivers, Riparian rights, Stream beds, Bank erosion, Boundaries (Property), Avulsion, Bank stabilization, River flow, Islands, Beds, Meanders.
Identifiers: High water mark.

Action was brought to quiet title in plaintiff, the record title holder of Missouri River bottom land. The river by its meandering submerged the land which later reappeared when the river moved by avulsion. The shift of the channel left chutes bounding the property. However, since these were not normal channels, the land failed to conform to the concept of an island as a body of land emerging from a stream and completely surrounding by channels. Application of avulsion principles would require that the river suddenly shift, cutting off a body of land identifiable as property which existed before the shift. In this case the land was completely submerged, thereby losing its identity. Since the defendant had not held the land by open and continuous possession for 10 years, he could not claim title by adverse possession. (Rives-Fla)
W69-00026

DENEERGAARD V DILLINGHAM (LICENSE TO TAKE FROM ANOTHER'S SPRING).

187 A 2d 494-499 (Vt 1963).

Descriptors: *Vermont, *Springs, Boundary disputes, Permits, Water law, Legal aspects, Judicial decisions.

The case involved an action for a reformation of the plaintiff's deed to a parcel of land so that three springs would be within its boundaries. The lower court reformed the deed, but included only one of the springs within the plaintiff's property. The court in the instant case upheld the lower court after a review of the facts and the law of reformation of instruments. As to the plaintiff's claim of the existence of a lincense to take water from a spring that was not included within his property, the court held against him. The court stated that a license to take water from a spring can come into being only by the consent of the owner of the land where the spring is located, although consent may be inferred from circumstances indicating tacit consent or acquiesence. However, the plaintiff did not carry his burden of proof in this matter. The decree of the Chancellor was therefore affirmed. (Patterson-Fla)

GREEN V ELDRIDGE (NAVIGIBILITY TEST IN MARYLAND).
230 Md 441 187 A 2d 674-678 (1963).

Descriptors: *Maryland, *Navigable waters, *Ownership of beds, *Water law, Watercourses (Legal), Judicial decisions, Boundaries (Property), Marshes, Streams.
Identifiers: Public trust doctrine.

This case involves a suit for an injunction and money damages for making more difficult the construction of a roadway the plaintiff alleged he was entitled to build by virtue of a deed from his predecessor in title. It was claimed that the deed conveyed fee simple title to a strip through a creek and marsh upon which the plaintiff desired to construct the road. The Chancellor found that the deed in question granted the plaintiff only an easement; since the creek and marsh were navigable, the bed was owned by the state. The central issue is whether the Chancellor erred in determining the creek and marsh to be navigable. The court in the instant case agreed with the Chancellor. After a review of the cases, the court stated that the waters were navigable under both the old ebb and flow of the tide test and under the more recent navigability in fact test. Traffic of smaller boats was sufficient to establish navigability, since it is not necessary to a stream's being navigable that it be capable of carrying large vessels, or supporting commercial traffic. (Patterson-Fla)

STATE V MCDONALD LUMBER (LAKES SHORES).
State of Wisconsin.

18 Wis 2d 173; 118 N W 2d 152-154 (1962).

Descriptors: Wisconsin, Lakes, *Ownership of beds, Excavation, *Lake beds, Legislation, Landfills, Boundaries (Property), *High water mark, State governments, Accretion, *Lake shores, Riparian land, Water law.

The property in question is located at the shoreline of Green Bay just east of the mouth of the Fox River. The city of Green Bay deeded part of this property to the defendant. In 1957, the defendant applied to the Army Corps of Engineers for a permit to construct a dock and slip east of the mouth of the river. The defendant also requested a state permit for this project. Although the Army issued a permit, the state did not. The trial court found the defendant guilty of excavating and filling part of the lake bed without first obtaining permission from the state. The court enjoined the defendant from filling further out into the water but refused to order abatement of the alleged nuisance and also refused to grant an injunction against continuance of unauthorized excavation and trespass. In affirming the trial court, the court held the state had not supported its burden of accurately proving the old shoreline of the lake and was not entitled to injunctive relief. (R. Smith-Fla)
W69-00039

STATE V RAYMOND (LEGAL ASPECTS OF ACCRETION).
119 N W 2d 135-140 (Iowa 1963).

Descriptors: Riparian rights, Navigable waters, Ownership of beds, *Riparian land, Water law, *Accretion (Legal aspects), *Islands, Missouri River, High water mark, Iowa, Aerial photography, Charts, Channel improvement, Diversion, Flow control, Vegetation, Iowa.

All the parties to this action agreed that the land in question formed as accretion. The plaintiff claimed it developed in the form of an island that arose in the bed of the Missouri River commencing in 1938. The defendants contended the property formed as a direct accretion to their riparian lands commencing in 1939, and remained joined to their land until the 1943 flood. The parties did not disagree on the title to land so formed or the rules of law applicable to questions of accretion. The issue before the court was solely a question of fact. The court reviewed the evidence before the trial court and affirmed its decision that the land developed as an island. (R. Smith-Fla).
W69-00040

PARISH V SPENCE (SURVEY SHORELINE BOUNDARIES).
149 So 2d 58-65 (Fla DCA 1963).

Descriptors: *Survey, Water law, Meanders, *Boundaries (Property), *Streams, Accretion, Florida, Bayous, Topography.
Identifiers: Dependent resurvey.

Plaintiffs have appealed from a summary judgment for defendants. The issue before the court was whether the trial judge erred in ruling that the plat of the 1932 survey, together with the field notes were inadmissible. Defendants contend that the U S Government conveyed title to Lot 6 and 7 in accordance with the original survey as shown by the 1826 plat. They emphasize that Juniper Creek is delineated on the original plat which affirmatively establishes that no part of Lot 7 lies westerly thereof or westerly of Boggy Bayou which formed a natural boundary between the southern portion of the two lots. It is defendant's position that the purpose and effect of the dependent resurvey of 1932 is to show an easterly shift in the southerly course of Juniper Creek and a southwesterly recession of Boggy Bayou thereby changing the boundary line between lots 6 and 7. The court set aside the summary judgment and ordered that the dependent resurvey of 1932, and the field notes from which the plat was prepared be admitted into evidence for the purpose of proving the issues in the case. (R. Smith-Fla)

WAGGENER V LEGGETT (TRESPASS TO LAND - DREDGING AND CAVE-IN).

150 So 2d 529-531 (Miss 1963).

Descriptors: *Mississippi, *Dredging, *Damages, Legal aspects, Judicial decisions, Boundaries (Property).

The plaintiffs brought an action for trespass to land against the defendants, who allegedly dredge soil from the bottom of a bayou and thereby removed part of the plaintiff's shoreline and caused a cave-in. The court in the instant case upheld a ruling of the trial court judge to the effect that where diminution of the permanent value of the land is less than the cost of restoration, an instruction requiring the jury to apply the before-and-after rule, ie, measurement of permanent damages by the difference in the value of the land before and after the trespass, is proper. (Patterson-Fla)

LOPEX V SMITH (THE EFFECT OF NAVIGABILITY ON BOUNDARY DETERMINATION).
145 So 2d 509-522 (Fla DCA 1962).

Descriptors: Florida, Judicial decisions, Navigation, Navigable waters, *Boundary disputes, Meanders, *Surveys, Patents, *High water mark, Boundaries (Property).

This was an action to establish ownership of certain island property. The issue was whether the rivers in question were navigable and if so, had been at statehood. It was found that the river had been navigable since statehood, and therefore, boundaries in question were to be determined by highwater marks rather than by meander lines. Navigation was defined in terms of useful purpose, stating that a river is navigable at law if it is navigable in fact. (Crabtree-Fla)
W69-00048

BEDINGFIELD V WATSON (PROPERTY BOUNDARIES).
147 So 2d 458-462 (La 1962).

Descriptors: Federal government, State governments, Louisiana, Navigable waters, Water law, *Boundaries (Property), Lakes, *Lake shores, Surface waters, Legal aspects, *Contours, Land, Land tenure.

The property in question was located below the 148.6 foot contour line of Lake Bistineau. It was acquired by the State of La upon its admission into the Union as a state, since Lake Bistineau was, in 1812, a navigable stream. The plaintiff alleged ownership of the land in question. The defendants denied this allegation and claimed ownership of the same property on the basis of inheritance from their ancestor-in-title or in the alternative, that they acquired ownership by prescription. The court held that since the defendant's chain originated in a title from the United States Government, it did not extend below the contour line. The defendants claim to the property must therefore, be predicated solely on their plea of acquisitive prescription. The court affirmed the trial court and concluded that the defendants did not establish such possession as owner for the requisite 30 years as would entitle them to acquire title thereto under their plea of prescription. The court held the plaintiffs were the owners of the property in question. (R. Smith-Fla)
W69-00049

THORNHILL V SKIDMORE (EASEMENTS OF ACCESS TO CANALS).
227 N Y S 2d 793-801 (1961).

Descriptors: New York, Judicial decisions, *Access routes, Recreation, *Artificial watercourses, *Canals, *Easements, Taxes, Right-of-way, Community development, Public rights, Prescriptive rights.
Identifiers: Tax title.

This case concerned the plaintiff's right of access to a canal. After first holding that there are no public rights as to an artificially created canal, the court held the purpose of an open area at the end of the canal which was never conveyed out by developer was to afford access to canal to the owners of lots not abutting the canal, and that a tax title conveying such open area to a purchaser at a tax sale from an 'unknown owner' did not operate to relieve the open area of the burden of the easement. (Crabtree-Fla)
W69-00050

VILLAGE OF OLD FIELD V SCHUYLER (DREDGING STATE SOIL IN RIVER BEDS).

16 A Div 2d 496; 229 N Y S 2d 710-714 (1962).

Descriptors: New York, Judicial decisions, *Ownership of beds, Permits, *Dredging, Flood protection, Channel improvement, Beach erosion, State governments, Legislation, Storms, *Bank erosion, Avulsion.

This was a proceeding on a petition to review and annul a license to dredge on state land under water. It was held that the statute authorizing removal of soil from state land under water was intended only to permit an upland owner to improve or protect property or to remedy or prevent shoreline erosion from the action of water or to restore soil washed away by violent storm and consequent avulsion, and that it did not authorize a license to dredge so as to permit a dredging barge to enter to deepen a pond. (Crabtree-Fla)

SCHULZ V CITY OF DANIA (PRESUMPTION OF EROSION).
156 So 2d 520-522 (Fla D C A 1963).

Descriptors: *Judicial decisions, *Florida, *Avulsion, *Erosion, Beach erosion, Beaches, Cities, Relative rights, Riparian rights, Oceans, Water law, Legal aspects.
Identifiers: *Presumption of erosion, *Burden of proof.

Defendant owned a lot originally bounded by the Atlantic Ocean on the east and by plaintiff's land on the west, but which had become submerged under the ocean. Plaintiff city brought a quiet title suit to have vested in itself and its assignee all of the riparian rights incident to its ownership of riparian land. The trial court found that the land had become submerged due to erosion, thereby causing the title to revert to the state, and entered the decree prayed for. Defendant contended on appeal that since the city instituted the suit, the burden of proof was on it to prove that the disappearance took place by erosion, and that this was not satisfied. The District Court of Appeal affirmed the decree, holding that there is a presumption that land disappears by erosion, thereby divesting the owner of title, as opposed to avulsion, not resulting in such divestment. Once plaintiff proved the land had disappeared, the burden shifted to defendant to prove by a preponderance of the evidence that the disappearance was a result of avulsion. (R.F. Williams-Fla)

ZABEL V WATER AND NAVIGATION CONTROL AUTHORITY (DREDGE AND FILL PERMIT REJECTION).

154 So 2d 181-188 (D C A Fla 1963).

Descriptors: *Florida, *Water law, *Administrative decisions, *Landfills, Riparian rights, Legislation, Dredging, Beds, Permits, Public rights.
Identifiers: *Constitutional law, Public trust doctrine, Sovereignty lands.

Plaintiffs petitioned defendant Pinellas County Water and Navigation Control Authority, pursuant to Florida statutes, requesting that it fix a bulkhead line and grant them a dredge and fill permit for 11.5 acres of their bottom land in Boca Ciega Bay. The Authority refused the permit, and on appeal, a lower court affirmed the Authority's ruling as well as holding that the plaintiffs were estopped from challenging the constitutionality of the statutes under which they were seeking relief. The court in the instant case, after a review of the evidence, held that it was sufficient for the authority to determine that there would be material adverse effects as a result of the proposed fill. Thus there was cause for withholding a permit. The court noted statutes dealing with establishment of bulkhead lines and the Authority's power to regulate dredging and filling. As to the constitutional issue, the court overruled the lower court's holding that plaintiffs were precluded from challenging the constitutionality of the operative legislation. However, it upheld the legislation as it was applied in the instant case. (Patterson-Fla)

VAN BROCKLIN V GUDEMA (WELL WATER POLLUTION CAUSED BY NEGLIGENCE OF ADJOINING FARMOWNER).

199 N E 2d 457-462 (111 1964).

Descriptors: *Water wells, Water pollution, Drainage effects, Surface runoff, Groundwater, Drainage water, Bacteria, *Water pollution effects, Taste, Illinois, Judicial decisions, Damages, Color.

The litigants owned adjoining farm property. Defendant placed a large pile of manure on his property but in close proximity to the plaintiff's well. Rain water passing over the manure contaminated the water in plaintiff's well. Plaintiff and his family lost the use of the well for over eight weeks. He recovered damages for the inconvenience and discomfort caused by the temporary loss of water supply that resulted from the negligence of defendant. The appellate court agreed that inconvenience and discomfort are proper elements of recovery. Evidence of specific pecuniary damage need not be adduced. (Harriett-Fla)

TOWN OF SOMERSET V DIGHTON WATER DIST (LEGISLATION ON DIVERTING WATER SUPPLY).
200 N E 2d 237-240 (Mass 1964).

Descriptors: Public rights, Competing uses, Eminent domain, *Legislation, Project planning, Governments, Water law, Water rights, Water resources development, Riparian rights, Watersheds (Basins), *Water supply, Rivers, Surface waters, *Water wells, Pumping, Massachusetts.

In 1961 the plaintiff, because of an acute need for additional water supplies, initiated several steps to enlarge its water supply by diverting the waters of the Segreganset River to an off-stream reservoir. These steps included the authorization of plaintiff's treasurer to issue bonds in order to raise additional money. However, no formal order of taking of the reservoir land has been made or recorded. Pursant to this plan, the plaintiff entered into an agreement with Montaup to purchase some sixty acres of land in Dighton at the lowest riparian locus to the river. On August 30, 1962, the defendant's commissioners held what they declared to be an emergency meeting to adopt and record an order taking the waters of the Segreganset, before the plaintiff could obtain and record a deed from Montaup and before a restraining order freezing the status quo could be obtained. On the basis of a construction of the word 'appropriated' within the meaning of the Mass statutes, the court held the defendant's purported taking of the waters null and void. (R. Smith-Fla.)

ST MARY PARISH CO V STATE MINERAL BD (MINERAL LEASES OF WATER BEDS).
167 So 2d 509-517 (La 1964).

Descriptors: *Louisiana, *Judicial decisions, Beds, Beds under water, *Ownership of beds, Lakes, Water law, Administrative agencies, Legislation.
Identifiers: *Possessory action, Mineral leases.

This was a possessory action by a land company against the state mineral board to be recognized and maintained in possession of water bottoms in certain sections. Plaintiff's land was interspersed with water ways and lakes. The purpose of this action is to determine whether plaintiff or defendant has the right to grant mineral leases of the beds of the waters on plaintiff's land. The State of Louisiana was not joined as a party. Plaintiff seeks the benefit of a statute permitting possession of the whole of a tract without actual physical possession of every part of the tract. (Possession only, not title, is before this court.) The court found that plaintiff had regularly patrolled the area, granted an electric transmission right of way across the area, and drilled wells in the area, hence was in possession and entitled to benefit of the statute as to the disputed water bottoms. The court ordered defendant, as agent of the state, to assert any claim of ownership of the bottoms within 60 days. (Kirkconnell-Fla)

CITY OF DEMOPOLIS, ALABAMA V UNITED STATES (COMPENSATION FOR FEDERAL DAM PROJECTS).

334 F 2d 657-660 (Ct Cl 1964).

Descriptors: *Judicial decisions, *United States, Federal government, *Rivers and Harbors Act, *Navigation, Compensation, Water law, Legal aspects, Rivers, Cities, Sewage disposal, Municipal wastes.

Plaintiff was an incorporated city in Alabama which since 1904, had used a gravity sewage system to empty its raw sewage into the Tombigbee River, admittedly navigable. Pursuant to the Rivers and Harbors Act, the defendant Federal Government built a dam downstream from plaintiff city. This retarded the flow of the river and created a lake. The State of Alabama then required plaintiff to build a treatment plant for its sewage. Plaintiff estimated that the cost of such new system would be $950,052 and sued the Federal Government on the ground that its present system had been seized without compensation. The Court of Claims denied recovery. The rights of a riparian owner are subject to the paramount right of the federal government to improve navigation. This right extends up to the ordinary high water mark, which was above plaintiff's sewage outlet. The court does state that recovery may be had for flooding of municipal land above the high water mark. (R.F. Williams-Fla)

SCOTT V SLAUGHTER (LOWER RIPARIAN RIGHTS V UPPER RIPARIAN RIGHTS).
373 S W 2d 577-580 (Ark 1963).

Descriptors: Arkansas, Hunting, Fishing, Streams, Riparian rights, *Reasonable use, *Dams, *Appropriation, Commercial fishing, Reservoirs, *Preferences (Water rights), Priorities, Judicial decisions.
Identifiers: Commercial hunting.

The upper riparian defendant built three dams which lowered the streams flowing through lower riparian plaintiff's land. Defendant and plaintiff operate commercial hunting and fishing facilities on their respective premises. Plaintiff argued that defendant's impoundments constituted an unreasonable use of the water. Held, the right to use water for domestic purposes is superior to other uses, but other than domestic purposes, all other lawful uses are equal. When one lawful use is destroyed by another lawful use, the second must yield or may be enjoined. However, as in the instant case, reasonable and equitable adjustment may be made. Here, defendant was required to lower the dams partly in order to allow plaintiff enough water to reasonably meet his commercial needs. (Crabtree-Fla)

TOWN OF HEMPSTEAD V LITTLE (LITTORAL RIGHTS).
20 App Div 2d 539; 245 N Y S 407-410 (1963).

Descriptors: *Judicial decisions, *New York, Water law, Legal aspects, *Condemnation value, Compensation, Cities, *Eminent domain, Avulsion, Cities, Reliction, Alluvion, Littoral, Beaches, Coasts.

In a prior condemnation proceeding, the town acquired title to land owned by the claimants. These lands consisted entirely of uplands, and it was found that the submerged portions had become submerged by avulsion. In the absence of the Town's condemnation, the owners would have retained title to the submerged land if it had once more emerged. When the town condemned the uplands, it also obtained littoral rights, making the fee title of claimants to the submerged lands subject to divestment in the event and to the extent of future alluvion or reliction. Therefore, claimants' unity of title to uplands and submerged lands lost by avulsion was broken when the town obtained the uplands and littoral rights, and an award in this subsequent condemnation suit based on use of several parcels including those to which the town had acquired littoral rights as a single unit was error. BROWN V ALABAMA POWER CO (BUILDING ENJOINED BY OWNER OF FLOWAGE EASEMENT).
156 So 2d 153-157 (Ala 1963).

Descriptors: *Judicial decisions, *Alabama, Remedies, *Easements, Water law, Water rights, Flood damage, Real property, Flooding.
Identifiers: Flowage easements, Injunction.

The Alabama Supreme Court held that the erection of a house or cottage on land on which a power company owned a flowage easement or an easement to flood the land was rightly enjoined where water would cover a portion of the structure. The holder of an easement has the dominant estate; the owner of the servient estate can be enjoined from performing acts which interfere with the proper enjoyment of the easement. That an obstruction of an easement is of minor degree furnishes no standard for justification if the obstruction clearly interferes with the enjoyment of the easement. (MacMillan-Fla)

TOWN OF ASHWAUBENON V PUBLIC SERV COMM'N (BULKHEAD LINES IN NAVIGABLE

LIBRARY U. OF I. URBANA - CHAMPAIGN

WATERS).

22 Wis 2d 38; 125 N W 2d 647-656 (1964).

Descriptors: Wisconsin, *Bulkhead lines, Shores, Navigation, Cities, Navigable waters, Judicial decisions, Piers, *Ownership of beds, State jurisdiction, *Submerged lands act.
Identifiers: *Trust Theory.

The issue here was the construction of a bulkhead line by a city which would require filling of a navigable river. It was held that the Trust Doctrine pertaining to navigable water does not preclude private structures and fill in beds of navigable rivers where the state legislature has expressly invited such physical interjection. Riparian owners have only qualified title to the beds of navigable rivers and title of the state is paramount; the rights of others are subject to revocation at the pleasure of the legislature. (Crabtree-Fla)

TAYLER V WEST VIRGINIA PULP AND PAPER CO (NAVIGABLE STREAMS).

262 N C 452; 137 S E 2d 833-837 (1964).

Descriptors: *Judicial decisions, *North Carolina, Water law, Legal aspects, *Right-of-way, Easements, *Condemnation, Navigable rivers, Lumber.

Petitioner was the owner of timberland which was completely surrounded by respondent's tract. Petitioner proceeded to ask for condemnation of a cartway leading from his boundary to the respondent's private dirt roads, over which he might carry his timber. Respondent answered that petitioner already owned a right-of-way to a navigable stream, and it also tendered to petitioner the right to use a strip of its land to build a road connecting to a public highway. At trial the judge found that both alternatives open to the petitioner (navigable stream and the offer of an easement) met the requirement of a necessary and proper access to petitioner's land. On appeal to the North Carolina Supreme Court, held, affirmed. Evidence that logs had been transported on the stream ten years prior to this case was adequate to sustain a finding of navigability. If a stream is navigable in fact it is navigable in law, and if such stream provides an adequate means of ingress and egress, the landowner is not entitled to another over the land, even though it may be more economical and convenient. NORMANOCH ASS'N INC V BALDASANNO (LAKE SHORES).
40 N J 113 190 A 2d 852-867 (1963).

Descriptors: Lakes, *Lake beds, *Lake shores, Boundaries (Property), Boundary disputes, Legal aspects, *Ownership of beds, Water law, Dams, Mill dams, Dam construction, Surveys, Mapping, On-site data collections.

This is an appeal by Normanoch from a judgment which dismissed its complaint demanding injunctive relief and damages against defendant for alleged trespass upon certain lands underlying Culvers Lake. Defendant denies Normanoch's title and claims title in himself. The issue was whether the Rutherfurd grant or the Niles deed encompassed the lands in question. The solution to this problem depends on the perimeter of the lake as it existed either at the time of the survey for the Rutherfurd grant on July 31, 1828 or at the recordation thereof on May 23, 1834, as Niles could have only obtained title to those lands which might now be submerged as were excepted from the Rutherfurd grant. Since the ultimate decision depended upon these two chains of title the court outlined the sequence of grants and conveyances. The court concluded that defendant had not presented sufficient evidence to rebut the presumption that the shore boundary had not changed between 1828 and 1882 nor had he disproved that Normanoch had title to the submerged lands. RECOMMENDED STATE LEGISLATION AND REGULATIONS.
Dept. of Health, Education and Welfare, Public Health Service.

Public Health Service, July 1965, 109 pp, 7 tab.

Descriptors: *Legislation (Laws), Well regulations, Sewerage disposal, Water supply.

The 'Urban Water Supply and Sewerage System Act' provides for the development of an official community plan for water and sewerage systems consistent with the needs of the area and for the control of installations. The 'Water Well Construction and Pump Installation Act' regulates the development of ground water systems and the location, construction, repair, and abandonment of water wells, and the installation and repair of pumps and pumping equipment to assure protection against possible contamination and to maintain a safe and potable water supply. The 'Individual Sewerage Disposal Systems Act' regulates the design, construction, installation, operation and maintenance of individual disposal systems and the proper planning thereof. The lack of legislation to regulate individual water supply and sewerage disposal in urban areas can create significant public health problems; the study recommends such acts be adopted to facilitate an orderly development of the water supply. (Gargola-Chicago)

RIGHTS OF THE STATES IN THEIR NATURAL RESOURCES PARTICULARLY AS APPLIED TO WATER,
South Carolina Univ., Columbia.
Dudley W. Woodbridge.
S C L Q, Vol 5, No 2-A, pp 130-140, Dec 1952. 11 p, 46 ref.

Descriptors: Water resource development, *State governments, Interstate, Federal government, *Federal-state water rights conflicts, Riparian rights, Equitable apportionment, Relative rights, Clouds, Cloud seeding, Groundwater, Surface water, Ownership of beds, Navigable waters, Percolating water, Water law.

As a result of the Revolution the people of each state became sovereign, and in that capacity acquired the rights of the crown in the public domain. The author describes in detail that although the states own their navigable waters this ownership is subject to the commerce power, the war power, the proprietary property rights, the treaty making power, the general welfare power of the federal government, the doctrine of equitable apportionment where the stream is an interstate one, and to any interstate compacts that have been made as well as the rights of riparian owners. It is also stated that the ownership of the states' navigable waters has a double aspect - the public right and the private right. To the extent that a state owns its navigable waters and the beds of streams in its private right it may alien the same as any owner. But to the extent that a state owns its public right it holds in trust for all its citizens and can grant no monopoly.

THE STATUS OF RIPARIAN RIGHTS IN CONNECTICUT,
Connecticut State Bar Assoc, Hartford.
T. Paul Tremont.
Conn B J, Vol 33, No 4, pp 430-439, Dec 1959. 10 p, 41 ref.

Descriptors: *Connecticut, *Riparian rights, *Docks, Public rights, Ownership of beds, Judicial decisions, Riparian land, Water law.
Identifiers: *Shoreland ownership, *Right to wharf, Public trust doctrine.

In Connecticut, the state owns land between the high and low water marks, holding it in trust for the people; however, the rights of the individual riparian owner on this land, called franchises, are in doubt. The basis of the riparian owner's franchise is the right to access, which is usually manifested through the right to erect wharves and piers. In the early 1900's, the right to wharf, which was liberally interpreted to aid developing economy, was expanded to the detriment of the public interest. One case went so far as to hold that riparian rights in the soil between the high and low water marks could not be taken for public use without compensation. However, the state is now asserting its valid interest in the public shorelands through statute and case law. The author urges that present public policy dictates closer adherence to the public trust doctrine.

WATER RIGHTS IN INDIANA.
Indiana State Bar Assoc., Bloomington.

Ind L J, Vol 32, No 1, pp 39-56, Fall 1956. 18 p, 11 ref.

Descriptors: *Riparian rights, Indiana, *Water law, Water resources development, Legislation.

Indiana water rights law is based on riparian rights doctrine and represents primarily a response of excess rather than water shortage. Comprehensive legislation is needed that would delineate private rights and create procedures for local organization and a favorable substantive law to encourage storage and other conservation measures. Indiana's legislative history in the area is discussed.

CRISIS, COMMUNITY AND CONSENT IN WATER POLITICS,
Duke Univ, Durham.
Henry C. Hart.
Law and Contemp Prob, Vol 22, No 3, pp 510-537, Summer 1957. 28 p, 1 fig, 90 ref.

Descriptors: *Water resources development, Administration, Federal-state water rights conflicts, *Political aspects, *Federal government, Government finance, River basin development, Planning, *State governments, Local governments, Cost sharing, Coordination, Multiple-purpose projects, Flood control, Dams, Water policy, Reservoirs.

This is a time, as this symposium shows, when many of us can be drawn into a re-examination of our approach to the government of water resources. We have failed to find viable answers to the problems of governing our water resources because we have been looking in the wrong places. We have looked to national departmentalization and executive organization, while the problem is basically one of public attention and interest. We have looked for assertions of policy, but the problem is one of discovering people's conscious needs. We have conceived of techniques as decisive and of the natural flow of water as embodying some human imperative, when its true human meaning is variety and diversity of potential. The water potentials which enlist human enterprise and decision over the years do not coincide, save by remote chance or by the most painstaking institutional arrangements, with states, cities or the nation. The author then proposes two alternative plans of future action to solve the above problem.

REPORT OF THE COMMITTEE ON MARINE RESOURCES.
American Bar Assoc., Chicago, Sect on Mineral and Natural Resources Law.

1967 Committee Reports, pp 226-250, 85 ref.

Descriptors: *Continental shelf, Continental slope, *Ownership of beds, Legislation, Administrative agencies, Submerged Lands Act, Beds, Oceans, State governments, Federal government, Water law, International law.
Identifiers: *Truman Proclamation of 1945, *Convention on the Continental Shelf, Outer Shelf Act.

The report, which covers background material and recent developments in the field of marine resources, is divided into 3 parts: (1) state marine resources; (2) federal resources; (3) international aspects of marine resources. The first part outlines items of interest in state-federal relations, geophysical and leasing activity, court decisions, departmental decisions, regulations and legislation occurring in the Atlantic, Gulf Coast and Pacific states. The second part investigates the Marine Resources and Engineering Development Act as background for 1966-1967 developments in federal marine resources, which include, inter alia, appointments to the Commission on Marine Science in the executive department and passage of the Clean Waters Restoration Act in the legislative branch. The final subdivision of the report focuses on: (1) the Truman Proclamation of 1945, which enunciated the legal concept of the continental shelf; (2) Congressional assertions of jurisdiction through the Submerged Lands Act and the Outer Shelf Act; and (3) the Convention on the Continental Shelf. The Convention defined the continental shelf as seabed adjacent to the coast to a depth of 200 meters or, beyond that, to a depth admitting of exploitation of natural resources.

JUDICIAL EXPANSION OF SEAWARD BOUNDARIES ABOVE SUBMERGED LANDS,
New York Univ. School of Law, New York.
Norman Frost.
N Y U Intra L Rev, Vol 16, No 4, pp 235-254, May 1961. 19 p, 84 ref.

Descriptors: *Submerged Lands Act, Judicial decisions, *Beds, *Ownership of beds, Federal government, State governments, Federal jurisdiction, State jurisdiction, Oil fields, *Continental shelf, Relative rights.
Identifiers: *Tidelands cases.

In U S v Louisiana and U S v Florida the Supreme Court held that under the Submerged Lands Act, the United States was entitled to all lands, minerals and other resources underlying the Gulf of Mexico more than three geographic miles from the coasts of Louisiana, Alabama, and Mississippi. Florida and Texas were allowed to set their boundaries at 10.5 miles from their coastlines. The Act's provision that a state's boundaries could exceed the three mile limit if they so existed 'at the time' they were admitted to the Union allowed this result. The vast supplies of oil and gas which have been discovered in the continental shelf precipitated the disputes. The 'tidelands' cases, holding that the United States was owner of the three-mile marginal belt, are discussed and criticized. The Submerged Lands Act was passed in 1953 to reverse the result of these cases. The Outer Continental Shelf Lands Act retained jurisdiction over the lands seaward of the state boundaries in the federal government. In conclusion, U S v Louisiana and U S v Florida are criticized.

REPORT OF THE COMMITTEE ON WATER RESOURCES.
American Bar Assoc., Chicago Sect. of Mineral and Natural Resources Law.

1963 Committee Reports, pp 158-186.

Descriptors: *Water law, *Legislation, *Judicial decisions, *Administrative decisions, Georgia, Minnesota, Water resources, Federal-state water rights conflicts, Federal government, State governments, Water management (Applied).

The report is divided into three parts, the first dealing with legal developments in the field of water resources in various states and the federal government for the period May 1962 through April 1963. These developments are discussed under the headings of legislation, judicial decisions and administrative action. Among the states reporting are Georgia and Minnesota. Significant federal developments include legislation affecting reclamation projects, coordinated watershed investigations and jurisdiction over interstate river pollution disputes. The second part consists of the first report of the Ground Water Management Subcommittee points out areas of concern that will be more fully developed in subsequent reports. Thirdly, a brief report on legislation relating to federal-state jurisdictional conflicts in water resources development is given.
W69-00298

REPORT OF THE COMMITTEE ON NATURAL RESOURCES.
American Bar Assoc., Chicago Sect on Mineral and Natural Resources Law.

1965 Committee Reports, pp 136-166, 26 ref.

Descriptors: *Water law, *Legislation, Judicial decisions, *Administrative decisions, Water resources, Minnesota, Federal-state water rights conflicts, Federal government, State governments, Water management (Applied).
Identifiers: Water Resources Research Act, Water Pollution Control Act.

The report is divided into three parts, the first dealing with legal developments in the field of water resources in various states and the federal government for the period May 1964 through April 1965. These developments are discussed under the headings of legislation, judicial decisions and administrative action. Although the states reporting are primarily in the western U S, Minnesota is included. Federal developments in the legislative area include enactment of the Water Resources Research Act and the Land and Water Conservation Fund. Among matters pending in the 89th Congress are Federal Water Pollution Control Act amendments, river basin planning proposals, and the Federal Water Projects Recreation Act. Administrative action taken by the Interior department and the Federal Power Commission is set forth. The second part consists of the report of the Ground Water Management Subcommittee, and the third treats federal-state water rights action.
W69-00299

REPORT OF THE COMMITTEE ON WATER RESOURCES.
American Bar Assoc., Chicago Sect of Mineral and Natural Resources Law.

1966 Committee Reports, pp 184-226, 77 ref.

Descriptors: *Water law, *Legislation, *Judicial decisions, Administrative decisions, Minnesota, Illinois, Iowa, Water resources, Federal government, State governments, Water Quality Act, Wild River Act, Water Resources Planning Act.
Identifiers: Water Project Recreation Act, River and Harbor Act.

The report is divided into two parts, the first dealing with legal developments in the field of water resources in various states and the second covering the federal government for the period May 1965 through April 1966. These developments are discussed under the headings of legislation, judicial decisions and administrative action. Although the states reporting are primarily in the western U S, Minnesota, Illinois and Iowa are included. Federal developments in the legislative area include enactment of the Federal Water Project Recreation Act, the Water Resources Planning Act, the Water Quality Act, and the River and Harbor Act. Among matters pending in the 89th Congress are the Wild Rivers Bill and the Colorado River Project. Relevant judicial decisions and administrative action by the Federal Power Commission are set forth.
W69-00300

REPORT OF THE COMMITTEE ON WATER RESOURCES.
American Bar Assoc., Chicago Sect of Mineral and Natural Resources Law.

1967 Committee Reports, pp 200-225, 60 ref.

Descriptors: *Legislation, *Judicial decisions, Georgia, Iowa, Minnesota, Water resources, Federal government, State governments, Administrative decisions.

The report is divided into two parts, the first dealing with legal developments in the field of water resources in various states and the second covering the federal government for the period May 1966 through April 1967. These developments are discussed under the headings of legislation, judicial decisions and administrative action. Although the states reporting are primarily in the western U S, Minnesota, Georgia and Iowa are included. Federal developments in the legislative area includes enactment of several bills pertaining to water quality and water management, e. g., a bill creating a Department of Water Resources and another establishing minimum flows and levels.

PLEASURE BOATING IN A FEDERAL UNION,
Buffalo Univ.
G. Graham Waite.
Buff L Rev, Vol 10, No 2, pp 427-447, Winter 1961. 21 p, 81 ref.

Descriptors: *Boating, New York, Federal-state water rights conflict, *Navigation, Ownership of beds, Admiralty, *Water zoning, Lakes, Inland waterways, Prescriptive rights, Federal government, *Recreation, Public rights, Interstate.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Identifiers: Commerce power, Private rights.

This article considers the power to authorize recreational boating on inland waterways and to prescribe standards of conduct on water generally, and the power to zone waters to particular uses. Determination of whether to apply federal or state law in this area generally turns on applications of some concept of navigability. Navigability is defined for several purposes: (1) ownership of beds of watercourses in new states, (2) public v private rights, (3) waters subject to federal admiralty jurisdiction, and (4) commerce power application. It is suggested that the admiralty test may be expanded to include waters entirely within one state and which are navigable in fact only by motor driven pleasure craft. The conclusion is that control of activity on inland waters in the first instance is in state hands. However, as the activities take on increasing interstate significance, the federal government acquires power to control the activity as well. As to water zoning, New York's policy is examined. The conclusion here is that local or state zoning for certain uses, such as speed, is not an infringement on Federal law.
W69-00302

PUBLIC V PRIVATE: THE STATUS OF LAKES,
Buffalo Univ.
James Munro.
Buff L Rev, Vol 10, No 2, pp 459-471, Winter 1961. 13 p, 82 ref.

Descriptors: Minnesota, Wisconsin, Michigan, *Recreation, *Access routes, Saw log test, *Navigation, Federal government, Ownership of beds, Shape, Transportation, Prescriptive rights, Boat launching ramps, Fishing, Hunting, Social needs, Lakes.

The article deals principally with the use of lakes by the public for recreation. Specifically, it deals with how this issue has been resolved in Minnesota, Wisconsin, and Michigan, with some comments on how other states have dealt with the issue. The view taken is that navigability has been the controlling concept as to whether the public will have access to a lake. However, it is observed that many states have abandoned this principle in favor of common use irrespective of bed ownership or navigability. The historical dilemma centering on whether a state can define navigability differently than the federal government is examined. The importance given to the use of a lake when statehood was conferred is considered as to the relevance of determining navigability today. The article concludes that access by the public where trespass may occur is today's major problem, but, that in general, the law has kept up with the trend toward increasing common use by the public of lakes for recreation.
W69-00303

APPROPRIATION WATER LAW ELEMENTS IN RIPARIAN DOCTRINE STATES,
Buffalo Univ.
J. H. Beuscher.
Buff L Rev, Vol 10, No 2, pp 448-458, Winter 1961. 11 p, 48 ref.

Descriptors: Wisconsin, Indiana, Ohio, Minnesota, Prescriptive rights, *Natural flow doctrine, *Reasonable use, *Riparian rights, *Prior appropriation, Domestic water, Water pollution, Public utilities, Preferences (Water rights), Land use, Appropriable waters, *Appropriation.
Identifiers: Coriparians, Dam owners.

The article was based on illustrations drawn largely from Minnesota, Wisconsin, Indiana, and Ohio. It set out in detail the basic differences between riparian and appropriation principles, with a short history of the origins of riparianism. The decline of the natural flow precept was analyzed in terms of the reasonable use doctrine. Several specific deviations from pristine riparianism were mentioned including (1) prescriptive rights, (2) rights of domestic use, (3) dam owners and the rights of coriparians, (4) pollution and correlative riparian rights, (5) municipal water utilities and rights of coriparians, (6) preferences to industrial users, and (7) preferences assured by land use zoning. The article concluded that any description of 'riparian water laws' is far more complicated than would appear from repeated quotations about reasonable use, equality of right, and correlative cosharing. The article ignored the problems raised where 'navigability' must be considered.
W69-00305

FEDERAL LIMITATIONS ON STATE WATER LAW,
Buffalo Univ.
Frank J. Trelease.
Buff L Rev, Vol 10, No 2, pp 399-426, Winter 1961. 28 p, 162 ref.

Descriptors: *Federal jurisdiction, *State jurisdiction, Water resources development, *Federal-state water rights conflict, Navigation, Wildlife management, Financing, Planning, Public health, Legislation, Project planning.
Identifiers: Treaty power, War power, Proprietary power, General welfare power.

The most important source of federal jurisdiction over water is in relation to navigable waters under the commerce power. The article relates this power to limitations on the power of a state to legislate, limitations on the applicability of state legislation and the effect on state-granted private rights. Other federal powers in this area are mentioned including proprietary powers, war powers, treaty powers, general welfare powers, and the control of interstate relation. The article emphasizes state and federal coordination and cooperation. Specific reference is made to express federal recognition of state water law, corps of engineers projects, Department of Agriculture programs, federal water resource programs, Dept of Interior acquisiton powers, and federal programs concerned with wildlife management and control. The article concludes that the federal government seems to have almost unlimited jurisdiction over water. Where federal and state interests overlap, cooperation is the general rule. The dominance of the United States is due only in part to its constitutional powers; most of it is due to the dominent position of the federal government as financier and planner. (Crabtree-Fla)

STATE AND FEDERAL WATER LAWS AND CONSIDERATIONS AFFECTING FUTURE LEGISLATION.
North Carolina Board of Conservation and Development, Raleigh.

State and Federal Water Laws and Considerations Affecting Future Legislation, pp 1-151, Jan 1956. 151p.

Descriptors: *North Carolina, *Legislation, Water law, *Federal government, Administrative agencies, State governments, Water policy, Riparian rights, Prior appropriation, Judicial decisions, Eminent domain, Regulation, Federal jurisdiction, Navigation, Water pollution control, Flood control, Planning, Irrigation, Reasonable use.

Section One is devoted to North Carolina water laws. Emphasis is on the actual legislation. The relevant statutes are a major portion of the text. Those statutes which create the administrative agencies in North Carolina are included. In addition, comments are provided by interested persons and agencies. Section 2 gives a state by state synopsis of major water laws. Emphasis is on legislation and administrative regulations. Only North Carolina and Hawaii are not covered. Section 3 is devoted to federal laws pertaining to water resources. The areas included are navigation, flood control, multi-purpose planning, water power, stream pollution, reclamation, irrigation, water conservation and utilization, watershed protection and flood prevention, beach erosion, sea water and artificial rainfall. Section 4 deals with some of the factors to be considered as affecting future water legislation. Heavy emphasis is placed on the prior appropriation doctrine, its advantages and disadvantages. Alternatives to an adoption of the appropriation system are also presented. (Breuel-Fla.)
W69-00308

GEORGIA'S EXISTING WATER LAWS - THE RIPARIAN DOCTRINE.
Georgia Univ., Athens.

In a Study of the Riparian and Prior Appropriation Doctrines of Water Law, pp 1-18, Oct, 1955. 18 p, 23 ref.

Descriptors: Remedies, Civil law, *Judicial decisions, Legal aspects, Legislation, Natural flow doctrine, *Riparian rights, Riparian water, Riparian land, Water law, *Georgia, *Reasonable use, Surface waters, Groundwater, Irrigation, Non-navigable waters, Diversion, Beneficial use, Water pollution, State governments.

A study of the riparian doctrine as it developed in Georgia is presented. Georgia law respecting diffused surface waters, groundwater lakes and ponds, and non-navigable streams is given in concise form. Whether or not a riparian proprietor may put water to a specific use depends on whether or not the use is reasonable. There is no clear criterian, since reasonableness is a jury question. There is a distinction between diversion and detention of water. In the case of the former, a lower riparian owner may collect damages whether or not he is actually injured. Injunction and damages are both proper remedies. In the case of the latter, the reasonableness of the use is the key to whether or not a lower riparian owner has a remedy. Specific cases involving the application of the riparian doctrine in Georgia are considered and summarized. (Pfeiffer-Fla.)
W69-00313

FEDERAL JURISDICTION OVER WATER IN THE EASTERN UNITED STATES,
Michigan State Univ., East Lansing.
F. J. Trelease.
In Water Rights Conference, pp 1-18, March 29, 1960. 18 p, 19 ref.

Descriptors: *Federal jurisdiction, *State jurisdiction, Federal government, State government, *Federal-state water rights conflicts, Water law, Legal aspects, Administrative agencies, Legislation.

The article considers federal jurisdiction over water in relation to state jurisdiction in the field. The sources from which the federal government derives its power are considered, as are the sources of state power, and an analysis is drawn in areas where the two might conflict. The author then considers federal programs and how they are set up to work with the states. He enumerates the areas in which the two governments coordinate and cooperate in their actions. The cooperative and coordinative procedures have been concessions to State and local interests, thus permitting an interplay of governments and the balancing of state and national interests. The procedures of the federal agencies that have water resource development programs are designed to give the states a voice in those programs. (Horner-Fla.)
W69-00314

DEVELOPMENT AND ELEMENTS OF THE RIPARIAN DOCTRINE WITH REFERENCE TO THE EASTERN STATES,
Michigan State Univ., East Lansing.
H. H. Ellis.
In Water Rights Conference, pp 19-34, Mar 29, 1960. 16 p, 22 ref.

Descriptors: *Riparian rights, *Riparian land, Watercourses (Legal), *Water law, Legal aspects,

Streams, *Natural flow doctrine, Reasonable use, Water utilization.

The author first considers the history of the riparian doctrine. He sets forth the conditions preceeding it and explains its spread. The article then considers the principal elements of the doctrine that have developed over the years. It considers natural and artificial uses, the natural flow doctrine and the reasonable use doctrine. The discussion concerns mainly non-navigable watercourses, but it is pointed out that the doctrine usually applies to navigable watercourses also. Secondly, the author traces legislative developments in the area and considers their effect on water control.
W69-00315

IOWA'S NEW WATER LAW,
Michigan State Univ., East Lansing.
J. O'Connel.
In Water Rights Conference, pp 54-67, Mar 29, 1960. 14 p, 3 ref.

Descriptors: *Iowa, *Watercourses (Legal), *Drainage, Water utilization, State governments, *Legislation, Permits, Water law, Legal aspects.

The article discusses Iowa Code Chapter 455A (1958). The law provides for the establishment of a permit system and a Water Commissioner to administer the system. The law prohibits the diversion, storage or withdrawal of water for regulated uses from any natural watercourse, underground basin or watercourse, drainage ditch or settling basin without a permit from the water commissioner. In addition, no water or material from the surface may be diverted into any underground watercourse or basin without a permit. The statute enumerates the uses of water which are unregulated and therefore require no permit. The author also discusses the work of the Pendleton Committee, which made a comprehensive study and drafted the legislation.

WATER RIGHTS,
Wisc. Univ. School of Law.
J. H. Beuscher.
College Printing and Typing Co., Madison, Wisc., 1967, pp 1-434, 434 p, 5 map, 3 illus, 35 photo, 4 dwg, 2 tab, 5 chart.

Descriptors: *Water rights, *Water law, *Riparian rights, *Judicial decisions, Wisconsin, Southeast U.S., Interstate compacts, Prior appropriation, Northeast U.S., Water policy, Pollution abatement, Hydrologic cycle, Surface runoff, Groundwater, Watercourses (Legal aspects), Water allocation (Policy).
Identifiers: Public interests.

This work presents materials used for a course in water law at the University of Wisconsin Law School. The focus of the study is on the law of the eastern states and on the law of Wisconsin in particular, although western appropriation law and western water allocating institutions are also surveyed. Included along with cases are excerpts from law reviews, statutes, compacts, Restatements, and other material. Cases are often supplemented by extensive editorial comments. The major areas included in the study are: (1) water regimes and water law, including a brief study of the hydrologic cycle; (2) the law of diffused surface water; (3) the law of percolating ground water; (4) private rights in watercourses under both the riparian and prior appropriation systems; (5) limitations imposed on private water rights by assertions of public interest; (6) water pollution abatement; and (7) allocations of water between states and interstate water compacts.
W69-00317

TAXATION OF LANDS COVERED BY NAVIGABLE WATERS USED FOR COMMERCIAL PURPOSES.
State of Florida.

1964 Fla Att'y Gen Rep, No 064-65, May 19, 1964. 2 p.

Descriptors: *Florida, *Taxes, Beds, Navigable water, Riparian land.

The question is whether privately owned lands covered by navigable waters are subject to ad valorem taxation when used by their owners, or under their authority, for commercial purposes. The opinion stated that lands in private ownership are subject to taxation, unless specifically exempted by some provision of the State Constitution, or are held and used exclusively for religious, scientific, municipal, education, literary or charitable purposes. The land in question is taxable unless it falls within some constitutional or valid statutory tax exemption. (Horner-Fla)
W69-00319

REGULATION OF COASTAL CONSTRUCTION.
State of Florida, Office Attorney General, Tallahassee.

Rep Att'y Gen Fla 065-119, Oct 25, 1965.

Descriptors: *High water mark, Low water mark, *Local governments, Riparian land, Public rights, State jurisdiction, *Florida, *Intertidal areas, Remedies, Structures, Statutes, Ordinances, Coasts, Riparian rights.
Identifiers: Purprestures, Setback lines.

The sovereign state, in the public interest, may subject a landowner's riparian rights to lawful regulation. Florida, by statute, requires its Board of Conservation to issue permits for any coastal construction undertaken by a person, firm, corporation etc, upon the sovereignty lands of the state below the mean high water line of any of its tidal waters. The conservation board is similarly empowered by statute to compel the removal of any structure upon such land if it deems it unnecessary, undesirable, serves no public purpose or is dangerous to human life, health or welfare. There is, however, no specific statutory authority by which the Board can regulate coastal construction above the mean high water line on privately owned property, even if such construction would have an adverse effect on public interests. A board of county commissioners likewise has no specific statutory authority to create setback lines on the foreshore of incorporated areas, although such a board may, with the consent of the conservation board and any municipality or other involves political authority, regulate physical work and activities along the county-shoreline. (Geraghty-Fla)

WATER AND SEWER REGULATIONS.
State of Florida, Tallahassee.

Fla Stat Ch 367 (1967).

Descriptors: Water works, Water distribution, Sewage districts, Water law, *Public utilities, *Use rates, Water transfer, *Florida, Administrative agencies.

Section 367.02 defines 'water system,' 'sewer system,' and 'public utility.' Section 367.03-.06 provide for the registration and certification of public utilities. Section 367.07 delineates the powers of the Florida Public Services Commission and section 367.01 establishes its jurisdiction. Section 367.08 sets up the limits to which a system may expand and provides procedures for accomplishing such. Section 367.10 provides for the transfer of certificates. Section 367.11 sets forth the duties of a public utility and Sections 367.12 through .16 deal with rates. Section 367.15 further delineates the powers of the commission and section 367.21 provides that its jurisdiction shall be exclusive. (Dann-Fla)
W69-00321

STATE BOARD OF CONSERVATION - WATER RESOURCES DIVISION.
State of Florida, Tallahassee.

Fla Stat Ch 373 (1967).

Descriptors: *Artesian wells, Well regulation, Public benefits, Beneficial use, Average flow, *Administration, Resources development, Water law, Water districts, Weather modification, Storage, Reasonable use, Easements, Adjudication procedure, *Saline water-freshwater interfaces, River basins, *Florida, Administrative agencies, Legislation.

Section 373.021 defines artesian wells and waste. Section 373.031 provides that the flow of artesian wells must be regulated within 90 days after June 15, 1953. Section 373.041 provides that violation of .021 or .031 shall be a misdemeanor. Section 373.051 provides for the capping of unregulated wells by the state and assessment of costs against land owner. Section 373.061 exempts from 373.021-.051 those wells which feed lakes in existence prior to June 15, 1953 where the flow is necessary to the existence of the lake. Section 373.072 (1) declares waters to be a natural resources, (2) vests control in the state and declares policy. Section 373.081 defines various terms for statutory purposes. Section 373.131 sets forth general powers and duties of the Water Resources Division. Section 373.141 authorizes capture, storage and use of water under certain circumstances. Sections 373.141-.182 empower the State Board of Conservation to set up water regulatory districts and provide the administration of same. Section 373.192 provides for annual conferences of water resources development programs. Section 373.193 provides for a representative to the southeast river basins resources advisory board. Sections 373.194-.221 deal with establishing a salt water barrier line. Section 373.321 vests power in the division of water resources to operate within any flood control or water management district. (Dann-Fla)
W69-00322

PLANNING FOR STATE WATER RESOURCES ADMINISTRATION,
Dwight F. Metzler.
AWWA J Vol 58, No 7, pp 793-800, Jul 1966. 8 p, 11 ref.

Descriptors: Administrative agencies, *Coordination, Decision making, *Future planning (Projected), Kansas, Long term planning, Programs, *Resource allocation, State government, Water resources, Administration, *Planning, Water allocation (Policy).

It has become increasingly important for each state to organize a central program for the allocation, distribution, and quality control of water resources. In order to implement such a program, the state must determine its water needs in sufficient detail to provide guidance to policy objectives. The economic and social water needs of a state may differ substantially from federal needs. Basic economic and population data provides a basis for the allocation of water among several alternative purposes. The state should implement its policy through coordination with agencies of local and federal government. The state should provide tax laws and laws governing the issuance of bonds so that the local governments can deal with their water supply. A legal framework in which one agency is responsible for keeping the legal aspects of the program under continuous study is necessary for the implementation of policies. The responsibility for the development of policy and the coordination of the state agencies which collect data, investigate, and enforce laws, should be focused on

LIBRARY U. OF I. URBANA - CHAMPAIGN

one agency. Kansas has made marked progress using this technique. (Molica-Fla)

POLLUTION CONTROL AND THE FEDERAL POWER COMMISSION,
J. A. Carver.
Natural Resources Lawyer, Vol 1, No 1, p 32-38, Jan 1967. 7 p, 6 ref.

Descriptors: *Air pollution, *Water pollution, *Political aspects, Federal Power Act, Federal government, *Administrative agencies.
Identifiers: Federal Power Commission.

The author considers the responsiveness of the FPC to the problems of air and water pollution that might come within its boundaries. He points out the fields in which the FPC might act in combatting air and water pollution. The general public has a definite interest in the responsiveness of the FPC to pollution problems. The article points out the right of the public to participate in agency decisions and the need for interested citizens to take an interest. Recent court decisions have indicated that the agency must consider all factors brought before it in determining what is the best course of action in light of the public interest. The people have a right to be heard by the commission and it must consider the factors that they might bring before it. (Horner-Fla)
W69-00329

THE LEGISLATIVE APPROACH TO AIR AND WATER QUALITY,
M. N. Edwards.
Natural Resources Lawyer, Vol 1, No 1, pp 58-69, Jan 1968. 12 p, 16 ref.

Descriptors: *Water quality, *Water Quality Act, Air pollution, Water pollution, Planning, Clean Air Act, Federal government, Administrative agencies, State government, Local government, Legislation, Water pollution control, Pollution abatement.
Identifiers: Clean Water Restoration Act, Water Pollution Control Act, Water Pollution Control Admin.

The article covers the basic federal legislation dealing with water and air pollution. The federal legislation has placed the primary responsibility for the control and abatement of air pollution on State and local governments. Congress has assumed a role of support and leadership by providing machinery and money; but state and local governments in many instances have not responded as adequately as the problem demands. Congress has provided strong and effective tools for the control of water pollution, but the problems are increasing and both local and federal governments must increase efforts in order to keep pace. GEORGIA LAWS, POLICIES AND PROGRAMS PERTAINING TO WATER AND RELATED LAND RESOURCES,
Georgia Institute of Technology, Water Resources Center.
G. R. Elmore.
Final report Project B-2701, Contract DA-CW55-67-C-001, Water Resources Center, Ga. Inst. of Tech., Atlanta, Ga., June 1967, 123 p, 51 ref.

Descriptors: *Georgia, *Legislation, *Judicial decisions, *Water law, Planning, Project planning, State government, Water rights, Water policy, Water quality, Administrative agencies, Local government, Water districts, Drainage, Conservation, Water utilization, Financing.

The background and current status of the legislative and organizational framework for the administration of Georgia's water resources are described in the report. Important water- and related land-resource developments are inventoried and a bibliography of important references and data sources is appended. Information on laws includes pertinent parts of the State constitution, statutes, regulatory measures, and case law as defined by significant court decisions. The administrative structure is outlined in terms of organic laws and administrative actions concerned with powers, duties, procedures and programs. Agencies and organizations covered include State, interstate, special district, and local entities concerned significantly with the management of Georgia's water resources. Agency programs are described, with emphasis on research, data collection, planning, construction, regulation, drainage, irrigation erosion and sedimentation control, and preservation of reservoir sites. (Horner-Fla.)

RHODE ISLAND WATER PLANNING,
J. H. Chafee.
J Amer Water Works Ass'n, Vol 59, No 4, pp 1213-1216, Oct 1967. 4 p.

Descriptors: *Rhode Island, River systems, Planning, Project planning, Reservoirs, Legislation, State government, Political aspects, Water storage, Water supply, Future planning (Projected).
Identifiers: Regional approach (Planning).

In an address to the Annual Conference of the American Water Works Commission, Governor John Chafee of Rhode Island explained the Rhode Island state-wide approach to water planning. In 1960 a study was prepared by expert consultants which showed three large areas that should be acquired for future reservoirs. Due to political problems only two of the areas had been acquired by 1964 and the third area was not purchased until a drought in 1966 increased the public's awareness of the water shortage problem. A task force was set up to make proposals to the legislature. As a result of the report of the task force, a state-wide water resources board was established to coordinate water projects and to work on long-range water planning. (Horner-Fla)

NOR ANY DROP TO DRINK: PUBLIC REGULATION OF WATER QUALITY PART I: STATE POLLUTION CONTROL PROGRAMS,
U of Iowa College of Law, Iowa City, Iowa.
N. William Hines.
U of Iowa L Rev, Vol 52, No 2, pp 186-235, Oct 1966. 51 p, 259 ref.

Descriptors: *Water pollution, Non-consumptive use, Consumptive uses, *Municipal wastes, *Industrial wastes, Agricultural chemicals, State governments, *Water law, Judicial decisions, Water pollution control, Water quality control, Public health, Legislation, Pollutants, Water demand, Pollution abatement, Administrative agencies, Organic wastes.

The primary purpose of this first of three articles is to explore state pollution control programs. As a background for this study, the author discusses the scope of the water pollution problem on terms of the demand for water and water quality. In short, a sufficient quantity of water is not the only problem. There is a qualitative problem as well, based on a hierarchy of water demands. The author briefly discusses the major pollution sources: municipal sewerage, industrial waste and agricultural waste. Consideration is also given to the nature of the conflict between private and public interest. The final phase of the background for state regulation is a discussion of the judicial remedies. The author then introduces state regulatory programs. In addition, a section is devoted to the role of public opinion. Following is a study of the constitutional problems inherent in state control and the limits on the police power. The final segment is devoted to the state's control, including patterns of agencies, the scope of the regulatory power, the creation of standards and their enforcement, and the importance of planning. WATER POLLUTION - ATTEMPTS TO DECONTAMINATE FLORIDA LAW,
U of Florida, Gainesville, Florida.
Frank E. Maloney, Sheldon J. Plager, and Fletcher N. Baldwin.
U Fla L Rev, Vol 20, No 2, pp 131-157, Fall 1967. 26 p, 174 ref.

Descriptors: *Water pollution, Nuisance (Water law), *Pollution abatement, Reasonable use, Standards, *Water quality act, Water quality control, Water pollution treatment, Domestic wastes, Agricultural chemicals, Industrial wastes, Phosphates, *Legislation, Legal aspects, Federal government, Regulation, Rivers and Harbors Act, Florida, Remedies.
Identifiers: 1967 Fla. Air and Water Pollution Control Act, 1965 Model Pollution Control Act, Federal Pollution Control Act.

Pollution in Florida arises from domestic, industrial and agricultural uses. Reasonable-use rule in Fla. imposes liability on pollution which is an unreasonable interference with use of water. Pollution may be attacked on nuisance or trespass theory. Injunction is preferable remedy; balance of convenience doctrine may defeat it. Damages may be given, but are inadequate without injunction because pollution is only compensated for, not prevented. Before 1967 Bd. of Health administered Pollution of Waters Act, approved sewage treatment plants, conducted research and gave technical aid to cities and industries. Local pollution control was under County Water and Sewer, Waste From Mines, and Municipal Zoning Acts. 1967 Florida Air and Water Pollution Control Act transferred regulatory powers of Bd. of Health to special agency, provided for permit system, and imposed state standards on local programs. 1967 Florida Act is compared with 1965 model act. 1967 act has stronger penalities; both have injunctive relief and civil damages. Federal Pollution Control Act of 1965 provides for abatement proceedings, but will normally not displace state actions. Plan requires states to establish guide lines, and authorizes funds for construction of sewage treatment plants and federal research grants. (Ausness-Fla)

IOWA'S NEW WATER STATUTE - THE CONSTITUTIONALITY OF REGULATING EXISTING USES OF WATER,
Jeffrey O'Connell.
Iowa L Rev, Vol 47, No 3, pp 549-636, Spring 1962. 88 p, 528 ref.

Descriptors: *Iowa, *Legislation, Judicial decisions, Legal aspects, Riparian land, Riparian rights, Riparian waters, Usufructuary right, Water law, *Water permits, Water rights, Watercourses (Legal), State governments, Hydrologic cycle, Navigable waters, Artificial use, Federal government.
Identifiers: *Constitutional law, Police power.

The thesis of the article is that provisions of Iowa's water rights statute, Iowa Code chapter 455A (1958), regulating existing uses of water (assuming they are regulated) should not render it unconstitutional. The author supports this thesis by a detailed examination of the background of the statute, its terms, prior laws, the need for new legislation, and

the legal issues the statute brings forth. The riparian right as a vested right is analyzed, as vested rights are generally protected from legislative deprivation. It is arguable that the statute does not affect vested riparian rights. The treatment given water rights legislation by state and federal courts is set forth, particular attention being given to the Iowa Supreme Court and its view of the police power. The distinction between existing and unused rights to water may serve to uphold the constitutionality of the statute. After summarizing the nature of common-law rights to water, including the powers of the state and federal government over water, the reciprocal rights of others, and the right to capture water, changes brought about by the Iowa statute are examined. 6F. Nonstructural Alternatives

FLOOD CONTROL ALTERNATIVES 'AND THE ECONOMICS OF FLOOD PROTECTION,
Washington Univ, Seattle.
Robert C. Lind.
Water Resources Research, Vol 3, No 2, pp 345-357, Second Quarter 1967. 13 p, 16 ref.

Descriptors: Flood control, Flood damage, *Flood plain insurance, *Flood plain zoning, Flood proofing, *Flood protection, *Risks, Benefits, Profit.
Identifiers: *Safety loading charge, Structural protection, Land enhancement, *Expected value of losses, Transaction costs.

This paper discusses and compares the economic effects of alternative programs for coping with flood losses. Special emphasis is placed on the use of flood insurance. The measurement of land-enhancement benefits is discussed in some detail. Several major conclusions were drawn. First, it is clear that from an economic point of view flood zoning is not a desirable method of coping with flood losses. It can only be justified on the grounds of political or administrative feasibility, which other programs might lack. Second, flood insurance should be carefully considered as an integral part of any program for coping with flood losses. Finally, land-enhancement benefits, properly measured, represent real gains that should be incorporated in benefit estimates. (Seneca-Rutgers)

6G. Ecologic Impact of Water Development

PETERSON V UNITED STATES (ACCRETION).

384 F 2d 664-668 (8th Cir 1967)

Descriptors: *Accretion (Legal aspects), *Boundaries (Property), Riparian land, Legal aspects, Riparian rights, Banks, Navigable waters, Island, Missouri River, Dams, Reservoirs, North Dakota.
Identifiers: Water line.

Action was brought to determine ownership of land condemned by the U. S. for construction of dam and reservoir. The disputed land once consisted of islands in the Missouri River. The islands disappeared and the land in question formed as accretion to the east bank of the river. The North Dakota statute provided that accretion to the bank of a river or stream, navigable, belongs to the owner of the bank. Where the water line is the boundary of property, that line, no matter how it shifts, remains the boundary. The accretion attached itself to the mainland and became the property of owners of the land banks to which it accreted. (Rives-Fla)

STEPHENS V DRAKE (OWNERSHIP OF LAND CREATED BY RIVER CHANGING COURSE).

134 So 2d 674-679 (La 1961).

Descriptors: Louisiana, Judicial decisions, *Accretion (Legal aspects), Ownership of beds, Wild rivers, River beds, *River flow, *Alluvial channels, Channels, Channel flow, Sand bar, Relative rights, Alluvion.
Identifiers: *Red River, Peninsula.

This action is the result of a dispute as to possession and ownership of land as a consequence of the Red River changing its course. It was held that the owners of land along the east bank of the river as it flowed prior to changing its course did not lose title to a peninsula consisting of alluvion and attached sandbar which had extended into the river from the east bank as the river formerly flowed, by reason of the peninsula's separation from their property when the river changed to a more easterly course, and the owners gained title to the old river bed as well, where the new channel cut through their land. ARIDITY AND SEMI-ARIDITY, A PHYTO-CLIMATIC CONSIDERATION WITH REFERENCE TO INDIA,
Institut Francais, Pondichery, India.
V. M. Meher-Homji.
Ann of Arid Zone, Vol 4, No 2, pp 152-158, Sept 1965. 7p.

Descriptors: *Arid climates, Semiarid climates, *Ecology, Humidity, Temperature, Precipitation (Atmospheric), Vegetation, Evaporation, *Classification, Climatic data, Agronomy, *Geographical regions.
Identifiers: India, *Aridity.

Bases for classification of arid or semi-arid regions were reviewed. An index of aridity-humidity was proposed based on the ecological formulae of Gaussen. Three principal ecological factors, temperature, precipitation and dry periods were considered. Vegetation types were explained on the basis of this index and areas of India were classified according to the developed index. (Affleck-Ariz)

ON THE OPTIMUM RECORDING OF A TYPE OF HYDROLOGICAL DATA,
Delft Technological Univ, The Netherlands.
M. B. Abbott, E. Pardo Castro, and P. Tas.
Bull Int Ass Sci Hydrol, Vol 12, No 1, pp 44-58, Mar 1967. 15 p, 14 fig, 6 ref.

Descriptors: *Hydrologic data, Mathematical models, *Optimization, *Sampling, *Timing, Frequency analysis, Computer programs, Approximation method, Time of concentration, Scheduling, Hydrologic properties, Analytical techniques.
Identifiers: Convergence, Difference equations.

An algorithm was developed for finding the optimum spacing of hydrologic data collection, where short periods of intense measurement activity may often be followed by relatively long quiescent periods. The algorithm provided a translation program which resulted in considerable reductions in data collection. It was shown that if the data stream could be represented by a twice differentiable function, that for a particular norm, the second moment of the second derivatives were constant over all optimum collection intervals. That property was used to construct an iterative difference scheme. Conditions for stability of the scheme were determined and incorporated into a computer program. The program was tested on a variety of data with satisfactory results. A flow diagram of the computer program was shown. Further development of the method was suggested. (Gysi-Cornell)

COMPUTER SYSTEM FOR THE REDUCTION AND ANALYSIS OF SOIL MOISTURE DATA,
Virginia Polytechnic Institute, Blacksburg.
V. O. Shanholtz.
OWRR report from Virginia Water Resource Research Center, 1968.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: Data processing, *Computer programs, Soil moisture, Moisture content, *Moisture availability.

A system of computer programs, written in Fortran IV for the IBM 7040-1401 system, but readily convertible to other systems, was designed specifically to expedite the reduction and analysis of soil moisture data. The system contains three unique or independent programs for the (1) reduction of basic field data, (2) coding, summary, and plotting, and (3) statistical analysis. Total or available soil moisture for depths of 3 to 6 inch increments up to a maximum of 72 inches can be determined for individual plots or any combination of plots for a given experimental design. The data can be plotted for any combination and/or coded for subsequent statistical analyses. (Shanholtz-VaTech)

LOW-FLOW INVESTIGATIONS: TECHNIQUES OF WATER-RESOURCES INVESTIGATIONS,
U S Geological Survey.
H. C. Riggs.
U S Geol Surv Prelim Rep, 15 p, 1968. 14 fig, 3 tab, 8 ref.

Descriptors: *Low flow, *Discharge (Water), Hydrographs, Stream gages, Duration curves, Frequency analysis.
Identifiers: Low-flow investigations, Low-flow frequency.

Procedures for defining and evaluating low-flow frequency curves at gaging stations, methods of estimating low-flow characteristics at sites where little discharge information is available, and methods for designing data-collecting systems and reporting results are described. Low-flow characteristics at a gaging station may be described by frequency curves of annual or seasonal minimum flows, by duration curves, and by base-flow recession curves. Ordinarily the characteristics defined at gaging stations cannot be transferred to ungaged sites because low flows are highly dependent on basin geology and evapotranspiration, neither of which can be adequately described, at present, by indexes in a given basin. However, estimates of low-flow characteristics at an ungaged site may be made if a few discharge measurements of base flow during the low-flow season are available. (Knapp-USGS)

COMPUTER SYSTEM FOR REDUCTION AND ANALYSIS OF HYDROLOGIC DATA,
Department of Agriculture, Beltsville, Md., Agricultural Research Service, Virginia Polytechnic Inst., Blacksburg, Virginia.
V. O. Shanholtz, and J. B. Burford.
Agricultural Research Service Bull ARS 41-132, July 1967, 90 pp, 9 fig, 29 tab, 4 ref, 10 append.

Descriptors: *Data processing, *Data storage and retrieval, Computer models, *Computer programs, Rainfall, Runoff, Streamflow, Land use, Soil moisture.

A system of computer programs has been developed to handle data related to precipitation, streamflow, temperature, air movement, soil moisture, and land use. Programs are designed to achieve the routine processing, to make certain analyses and summaries, and to select and arrange data in the required format for direct listing on the standard forms, which have been developed for the U.S. Dept. of Agric. Miscellaneous Publication, 'Hydrologic Data for Experimental Watersheds in the United States,' which is a continuing series. The programs are written in Fortran IV for use on the IBM 7040-1401 computer and are designed to accept input information in data card or magnetic tape form with the output on magnetic tape. ESTABLISHED SURGE ON AN IMPERVIOUS VEGETATED BED,
Div of Agr Eng Services, Agr Tech Services, Republic of S Africa, and California Univ., Davis.
W. P. J Wessels, and Theodore Strelkoff.
ASCE Proc, J Irrig and Drainage Div, Vol 94, No IR1, Pap 5832, pp 1-22, Mar 1968. 22 p, 1 tab, 10 fig, 15 ref.

Descriptors: *Open channel flow, *Steady flow, *Surges, *Irrigation ditches, *Model studies, Mathematical models, Hydraulics, Water measurement.
Identifiers: *Vegetated bed, Impervious bed, Parallel wire depth gages.

Theoretical and experimental determinations are made of the steady flow of a surge of water onto a dry, impervious bed studded with artificial vegetation-wires protruding through the flow at densities of 7.5, 29 and 116 wires per sq ft. The pertinent differential equation of the flow profile implies movement on a broad front, hydrostatic pressure distribution, no interference between the wakes of the individual resistance elements and constant bottom shear between the elements. Experimental data on profile shape and tip speed are gathered and recorded electrically by a combination of parallel-wire resistance probes, a scanner, an a. c. resistance bridge, and Sanborne recorder. Comparison of these data, brought to nondimensional form, with an analytic solution of the differential equation in similar form shows good agreement when the measured tip velocity has decreased from its initial value to within 5% of its terminal value, the flow velocity at normal depth. (Knapp-USGS)

J. Bear, D. Zaslavsky, and S. Irmay.
UNESCO Arid Zone Research, Series No 29, 465 p, 1968. 14 tab, 291 fig, 546 ref.

Descriptors: *Hydrology, *Hydraulics, *Porous media, *Percolating water, Unsaturated flow, Saturated flow, Leakage, Seepage, Filtration, Hydrodynamics, Models.
Identifiers: *Flow in porous media, *Hydrodynamic dispersion, Textbook.

A comprehensive reference and textbook that considers saturated and unsaturated flow of water, immiscible fluids, and miscible fluids through soil, rock and other porous media. Unsaturated flow, which is extremely complex because of interactions between water, air, dissolved and immiscible contents of water, the various constituents of porous media, and various interfacial tensions, is the central topic covered. Basic equations and assumptions of hydrodynamics are reviewed. Because the subject inevitably involves the fields of oil exploration, coastal fresh water development, pollution control, well performance, industrial filtration, chemical and petroleum engineering, ceramics, metallurgy, aeronautical engineering, drying and wetting of materials, and many other hydraulic and hydrologic studies, many fundamentals of fluid movement are covered in detail and illustrated with appropriate figures and equations. Because the book is intended for engineers who have to solve hydrologic and hydraulic problems, heavy emphasis is given to successful mathematical, empirical, and other methods for dealing with field situations. SEEPAGE THROUGH DAMS IN THE COMPLEX POTENTIAL PLANE,
Utah State Univ, Water Research Lab, Logan.
Roland W. Jeppson.
ASCE Proc, J Irrig and Drainage Div, Vol 94, IR1, Pap 5835, pp 23-39, Mar 1968. 17 p, 2 tab, 5 fig, 15 ref.

Descriptors: *Seepage, *Earth dams, *Boundaries (Surfaces), Anisotropy, Isotropy, Porosity, Dupuit-Forscheimer theory, Darcys law, Digital computers, Approximation method, Fluid mechanics, Seepage.
Identifiers: *Finite difference method.

A method is described of direct procedure for obtaining the solution of seepage through a homogeneous isotropic or anisotropic earth dam. Solution is obtained by finite differences. The x and y coordinates are considered the dependent variables and the velocity potential and the stream function the independent variables. Boundary value problems for y and x are formulated in the complex potential plane. Since the size of the flow field in the complex potential plane is unknown from specification of the size and shape of the dam, the final solution is obtained from a cycle of solutions each subsequent one of which is obtained in a field of more nearly correct size. Comparisons are given between the coordinates on the phreatic line obtained by this finite difference method and those obtainable from a solution by the velocity hodograph. Summarizing the results from a number of solutions of different geometries, a graphical relation is given relating the geometric parameters of the dam and the seepage quantity. (Knapp-USGS)

COMPILATION OF WATER RESOURCES RESEARCH IN SOUTH CAROLINA.
South Carolina Water Resources Advisory Committee.

Water Resources Res Inst, Clemson Univ, 38 p, May 1968.

Descriptors: *Data collections, *Research and development, *South Carolina, *Water Resources Research Act, Water resources, Hydrology, Engineering, Planning, Management.
Identifiers: Clemson University.

A report on water resources research in South Carolina was prepared by the South Carolina Water Resources Advisory Committee. One of the functions of this committee is to appraise the current level of research activity and to make recommendations on new research that should be initiated. The original manuscript prepared and distributed in 1966 is revised in an effort toward that objective. All Federal and State agencies concerned with water resources were requested to submit a description of the research projects currently being conducted in the State by their agency. A compilation of the project descriptions was submitted. The projects selected for inclusion in the report cover many aspects of the water resources field. However, water-related investigations where the primary objective was directed to plant growth, fish reproduction, etc are not included. The selection was made and categorized according to information by the Federal Council for Science and Technology Committee on Water Resources Research published in 'A Ten-Year Program of Federal Water Resources Research' in February 1966. FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF I. URBANA - CHAMPAIGN

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA - CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2B. Precipitation

MEASUREMENT OF PRECIPITATION OVER LAKE MICHIGAN,
Illinois State Water Survey, Urbana.
Stanley A. Changnon, Jr., and Floyd A. Huff.
OWRR Project A-012-Ill, Reprint Ser 65, pp 235-248, 1966. 14 p, 3 fig, 4 tab, 20 ref.

Descriptors: Bibliographies, *Atmospheric precipitation, *Measurement, *Precipitation (Atmospheric), *Rainfall, Radar, Instrumentation, Rain gages, *Lake Michigan.

The increasing need for accurate measurements of precipitation over Lake Michigan led to investigations of radar and climatological methods of measurement. One radar method used dense rain gage networks and 10-cm radars to evaluate the ability of radar to measure accurately the percentage change of warm season rainfall with distance. Long-term mean percentage changes could be used to compile estimates of lake rainfall by comparing the average changes with land precipitation data. This method produced unacceptable errors. Another radar method involved adjusting the radar-indicated rainfall with shoreline rain gage data for each rain, thus minimizing inherent errors resulting from variations of radar reflectivity. By this method, warm season rainfall over certain portions of the lake could be measured with an accuracy of 2% of a long-term operational basis. Difficulties associated with radar measurements of winter season precipitation, plus exorbitant costs of rain gage and radar facilities made this method unfeasible. Mean overlake summer rainfall, estimated using climatological analysis methods appears to be reasonably accurate since the difference between the maximum and minimum possible estimated average amounts over the lake is small.

DETERMINATION OF INTENSITY - DURATION - FREQUENCY - AERIAL COVERAGE OF INTENSE SUMMERTIME STORMS,
Michigan State Univ., East Lansing, Dept. Agr. Eng.
E. H. Kidder.
Terminal Rep, Dep of Agr Eng, Mich State Univ, 1967. 19 p, 2 fig, 3 tab, 2 ref. OWRR Proj A-009-Mich.

Descriptors: *Precipitation (Atmospheric), Intensity, Frequency, *Rainfall, Hydrologic data, *Hydrology, Gages, Precipitation intensity, Analysis, Meteorological data, *Rainfall disposition, *Rainfall intensity.

Precipitation data was collected from a dense network of recording raingages in Ingham County, Michigan, during Aug 1965 - May 1967. Only the storm of July 12, 1966 was significant. Twenty-nine gages recorded amounts equal to or above a 1-yr frequency for 1-hr catches. The catch of 1 gage exceeds a 1 in 25-yr frequency. An analysis of 6-hour amounts showed the catch of 6 gages above a 5-yr frequency. Computer analysis of data did not show a strip pattern of rainfall. It did bring out the repeated higher catch of the 1 gage.

A MOISTURE-BALANCE PROFILE ON THE SIERRA NEVADA,
Nevada University, Reno, Desert Res. Inst.
Charles F. Armstrong, and Charles K. Stidd.
Preprint Series 3, Feb 1967. 20 p, 7 fig, 3 ref. OWRR Proj B-008-Nev.

Descriptors: *Runoff, *Evapotranspiration, *Runoff forecasting, *Precipitation (Atmospheric), Profiles, Orography, Surface runoff, Effective precipitation, Elevation, Moisture availability, Watersheds (Basins), Hydrologic cycle, Topography, Investigations, Forecasting.
Identifiers: Thornwaite method, Sierra Nevada, American River Basin.

Profiles have been developed showing the variation with elevation of: runoff, evapotranspiration, interception, and precipitation. Data are from the American River Basin on the west slope of the Sierra Nevada. Elevations range from 200 to 10,380 ft. Data are adjusted to annual means for a 50-yr period. Results show that precipitation can be estimated as the sum of the three other factors and the resulting precipitation profile shows the general response of precipitation to orography in this region.

PRECIPITATION PROBABILITIES FOR MISSISSIPPI,
Mississippi State Univ., State College.
John C. McWhorter, Kenneth R. Matthes, Jr., and Burrow P. Brooks, Jr.
Water Resour Res Inst, Rept 1966. 51 p, 41 fig, 41 tab, 7 ref. OWRR Project A-001-Miss.

Descriptors: *Atmospheric precipitation, *Rainfall, *Probability, Seasons, Computation, Meteorological data, Meteorology, Correlation techniques, Mississippi, Seasonal, Correlation analysis.

The purpose of this study was to define more accurately rainfall variations and the following objectives were designed to accomplish this goal: (1) to determine the probability of receiving less than a given amount of precipitation for weekly, monthly, seasonal, or yearly periods for 10 geographical regions in the State of Mississippi, and (2) to examine the rainfall of 1 period of time with that of another period for State College, Mississippi, to determine if the rainfall of the 2 periods could be correlated. The precipitation probability tables were designed for reference material for water-use system planners and designers. Conclusions to be drawn from this study lie not in the results themselves, but in uses made of these results.

ANALYSIS OF QUASI-PERIODIC WEATHER DATA,
Connecticut Univ., Storrs, Civil Eng. Dept.
Chesley J. Posey.
Inst Water Resour Rep 3, Univ Connecticut, June 1967. 20 p, 19 fig, 9 ref, append. OWRR Project A-008-Conn.

Descriptors: *Weather data, Meteorology, *Analytical techniques, Turbulence, *Microenvironment.

Long-time records of daily maximum temperatures, already available on IBM cards, were studied to find out whether the frequency distribution of these values and of their first and second successive differences could serve the purpose of definitive identification, a goal that neither the harmonic analysis nor serial correlation methods have been able to achieve. Study was limited to records of up to 36 years, and included but three different geographical locations. The empirical evidence that each of the three frequency distributions tended to converge toward a fixed relationship as the period was lengthened was strong. The best discriminator between the locations seemed to be the distribution of daily maximums. The distributions of the first and second successive differences at the different stations were so similar as to give rise to formulation of an hypothesis of similarity of global atmospheric turbulence. The curves presented are of interest in comparing the climatological environments. A computer program is given which can be used to extend the study to include a wider range of data.

2C. Snow, Ice, AND Frost

A PRINCIPLE INVESTIGATION OF THE COMBINED HYDROLOGICAL AND MASS BUDGET OF A CRITICAL GLACIER BASIN ON THE RIM OF THE NORTH PACIFIC HIGH, ALASKA-CANADA BOUNDARY RANGE,
Michigan State Univ., East Lansing, Glaciological and Arctic Sciences Inst.
Maynard M. Miller.
Inst Water Res Prog Rep, Michigan State Univ, Feb 1967. 17 p, 3 fig. OWRR Proj B-002-Mich.

Descriptors: *Hydrologic budget, *Glaciers, Alaska, Hydrologic cycle, Weather forecasting, Ablation, *Water balance, Surface runoff, Melting, Heat budget.

This is a study of glacio-fluvial runoff as related to meteorological and hydrological conditions. Data are from the Lemon-Ptarmigan Glacier on the Alaska-Canada boundary range. The glacier is situated in the interaction zone between the main circulations of the continental anti-cyclone and the cyclonic North Pacific Low. This system is acutely sensitive to climatic perturbations of continental significance. The objective is to develop a prototype investigation of the water balance of a climatologically critical zone and to relate the trends of the water, ice, and heat budget to the long-term regional glacier pattern. This information will contribute to our ability to predict hydrological trends in other regions of North America. Measured runoff losses are compared with percolation water recaptured by freezing and capillary retention and with the total retained solid water. The water-ice budget is analyzed and related to secular temperature and precipitation trends and to the shifting position of the Arctic front. Instrumentation and techniques used to facilitate the research include recording thermographs, precipitation and stream gages, ablation stake networks, seismic profiles,

DEVELOPMENT AND TESTING OF SNOW PACK ENERGY BALANCE EQUATIONS,
Environmental Science Services Admin, Washington, D C.
E. A. Anderson.
Water Resour Res, Vol 4, No 1, pp 19-37, Feb 1968. 19 p, 12 fig, 1 tab, 18 ref.

Descriptors: Snow, *Snow surveys, *Snowmelt, *Energy balance, Melting, Runoff, *Runoff forecasting, Heat transfer, Thermodynamics, Mathematical analysis, Hydrology, Water sheds, Wind (Meteorology), Bibliographies, Models.
Identifiers: Mathematical models, *Snow pack.

A method was developed for computing the energy balance of a snowpack on a continuous basis. Estimates or measurements are required of net radiation or its components, air temperature, dewpoint, atmospheric pressure, amount and temperature of precipitation, surface snow density, and a wind function relating the vapor pressure gradient to moisture transfer. The 1954 Lower Meadow lysimeter studies showed good agreement between computed and observed values for snowpack runoff and snow surface temperature. A snowmelt and accumulation model was constructed by combining energy balance equations with relationships describing other components of the snowpack accumulation and ablation process. The Stanford Watershed Model is used to determine the time delay of water leaving the snowpack to the streamflow gaging station. The model gives a reasonable simulation of the observed mean daily flow hydrograph and seasonal areal snow cover plot using 5 yr of data from the Central Sierra Snow Laboratory. The model approximates the actual physical processes and will be valuable in future snow hydrology investigations. (USBR)

COMPARISON OF SNOW INTERCEPTION BY A HARDWOOD AND A CONIFER FOREST,
Maine Univ, Orono, School of Forestry and Water Resources Research Center.
C. E. Schomaker.
Res in the Life Sci, Vol 16, No 2, pp 35-43, Summer 1968. 9 p, 3 fig, 1 tab, 6 ref. OWRR Project A-005-Me.

Descriptors: *Interception, *Snow, *Rainfall, Snowmelt, Conifers, Hardwood, Pastures, Maine.
Identifiers: Snowfall interception.

The interception of snow and rain by a hardwood forest and a conifer forest near Orono, Maine are compared in a study made in 1965-1967. Interception by the conifers ranged from 35-37% of precipitation in winter and 27-35% in spring and summer. Interception by hardwoods ranged from 12-18% in winter and from 7-14% in spring and summer. In one study of snow accumulation on the ground, on Feb 2, snow depths were 16.0 in. under conifers, 24.5 in. under hardwoods, and 28.0 in. in open pasture. Snow melted off pasture first, followed by the hardwood and last, the conifer forest floor. (Knapp-USGS)

2D. Evaporation and Transpiration

PRELIMINARY LYSIMETRIC INVESTIGATIONS AT THE UNIVERSITY OF NEBRASKA FIELD LABORATORY, MEAD,
Nebraska Univ., Lincoln.
Norman J. Rosenberg.
Nebraska Water Resour Res Inst, Hort Proj Rep 60, 1966-1967. 111 p, 43 fig, 18 tab, 48 ref, 2 append. OWRR Project A-001-Nebr.

Descriptors: Advection, *Climatology, *Evapotranspiration, Estimating equations, Evapotranspiration control, Water conservation, *Lysimeters, *Regression analysis, Instrumentation, Bibliographies.

The installation of lysimeters, meterological instrumentation and data logging systems at the Nebraska Field Laboratory at Mead, Nebraska is discussed and illustrated. A preliminary study of wind conditions over the experimental field is included as well as lysimetric measurements of evaporation from bare soil during the summer and fall of 1966. Equations are developed through multiple regression techniques on commonly measured meteorological parameters to predict evaporation from bare soil. Effectiveness of antitranspirant materials on water economy of alfalfa summarized. (E. C. Reed-Nebr)

SOME EFFECTS OF CONTINUOUS ANTI-EVAPORATION FILMS,
Missouri University, Rolla and Texas A and M University, College Station.
Bobby G. Wixson, and William B. Davis.
Proc of 3rd Annu Amer Water Resources Conf, pp 170-174, Nov 8-10, 1967. 3 fig, 4 ref.

Descriptors: *Biochemistry, *Evaporation control, *Monomolecular films, Hexadecanol, Octadecanol, Algae, Bacteria, Oxygen demand, Biodegradation.
Identifiers: *Anti-evaporation films.

The ecological effects of a continuous anti-evaporation film of hexadecanol and octadecanol were studied in experiments designed to simulate field conditions as closely as possible without the size and complexity of natural systems. Light banks simulated sunlight energy, with photoperiods from 8 AM to 8 PM. Air and water temperatures were maintained at 22 deg C. The 20 gal glass aquaria were inoculated with pond water and algae for 3 consecutive 30 day tests. Half of the systems were filmed with a 1:1 mixture of hexadecanol and octadecanol at a rate of 0.05 pounds per acre per day. The number of bacteria increased in filmed systems, and biodegradation of the film caused oxygen demand. The film reduced oxygen diffusion rate by 10-15%. Initially algae growth was inhibited but the biodegradation of the film added nutrients which were used by some species of algae which increased in growth after 15 days. Reduced surface tension caused some algae to sink instead of float. (Knapp-USGS)

2E. Streamflow and Runoff

FLOODS FROM FOREST COMPARED TO THOSE FROM FARMLAND,
Colorado State University, Fort Collins.
Songthara O. Kar.
Interim Rep, Natur Resour Center, Colo State Univ, June 1967, 124 p, 4 fig, 16 tab, 2 appnd, 57 ref, disc. OWRR Project A-002-Colo.

Descriptors: *Floods, Watersheds (Basins), Watershed management, Cultivated lands, Forests, Grasslands, Deserts, Flood forecasting, Forecasting, *Hydrographs, Computers, Analysis, *Runoff, *Runoff forecasting.
Identifiers: Flood frequency.

An exploratory study on floods from forest compared to those from farmland was performed as an extension of a thorough study of hydrograph rise times. Fifty-one watersheds were classified, using as a criterion the watershed coverage, into 4 groups: forest, cultivated, grass, and desert. Equations for predicting rise times and 10-yr flood peaks were derived in simple and multiple regression analyses by computer. The best equations obtained were used to study the effects of changing the watershed coverage on rise times and flood peaks by using 2 average watersheds. No conclusions concerning the trend of behavior of watersheds compared are warranted. Detailed information on watershed coverage and condition must be secured before any further work is to be performed.

SOME ASPECTS OF TIME SERIES ANALYSIS IN HYDROLOGIC STUDIES,
U S Geological Survey, Washington, D C.
N. C. Matalas.
Proc of Hydrol Symp No 5, National Research Council of Canada, pp 271-309, Feb 1966. 39 p, 50 ref.

Descriptors: *Time series analysis, *Hydrology, *Streamflow forecasting, Mathematical studies.

Statistical techniques used to study the characteristics of hydrologic time series are reviewed and their use is explained. In time series analysis, an attempt is made to estimate and reconstruct the properties of the generating process of a phenomenon from the observed time series followed by the phenomenon. The estimates are made in either the time or frequency domain by the use of covariance or spectral functions, each of which is a Fourier transform of the other. Covariance seems the more appropriate for extrapolation into future time, but spectral techniques are easier to use to predict responses of river systems to stochastic inputs, particularly with linear systems. Autocorrelation in stationary hydrologic time series of annual events is attributed to storage and to persistence in precipitation and evapotranspiration, and much of the variance is accounted for by low frequencies. Annual floods have very little serial correlation. The assumption of first-order linear autoregression processes to account for effects of persistence is practical because the mathematical operations are tractable. (Knapp-USGS)
W69-00422

A MATHEMATICAL MODEL FOR SIMULATING THE HYDROLOGIC RESPONSE OF A WATERSHED,
Purdue Univ, Lafayette, Ind.
L. F. Huggins, and E. J. Monke.
Water Resour Res, Vol 4, No 3, pp 529-539, June 1968. 11 p, 9 fig, 1 tab, 14 ref.

Descriptors: *Watersheds, *Simulation, Runoff, Surface runoff, Storms, *Mathematical analysis, Drainage basins, Infiltration, Hydrographs, Soil moisture, Models, Slopes, Outflows, Hydrology, Grid systems.
Identifiers: *Mathematical models, Small watersheds, Rainfall-runoff relation, Interception, Storm runoff, Inflow.

A general mathematical model was developed to simulate surface runoff from watersheds. Based upon integration of the concepts of physical hydrology into quantitative relationships, the model avoids the use of lumped parameters by delineating the watershed as a grid of small independent elements. The resultant freedom from fundamental assumptions of the form of the system equations and from the permissible small areal resolution of the model permits study of complex combinations of watershed and storm conditions. Application of the model to two small watersheds indicated that additional research is needed to better define the relationships for surface runoff and infiltration and to improve the reliability of simulated runoff hydrographs. (USBR)

A NUMERICAL SOLUTION OF THE EQUATIONS OF MOTION AS APPLIED TO SURFACE FLOW,
New Mexico State Univ., University Park.
Ahmed Yousef Abdel-Razaq, and John W. Hernandez.
Eng Exp Sta, Tech Rep 36, Dec 1966. 90 p, 15 tab, 30 ref, 2 append. OWRR Project A-001-NMex.

Descriptors: Hydrology, Urban hydrology, Runoff, *Surface runoff, Hydraulics, Open channels, Watersheds (Basins), *Numerical method, Flood routing, Computer models, Synthetic hydrology, *Overland flow, Unsteady flow, *Motion, Rainfall, Impervious soils, Equations, Bibliographies, Demonstration watersheds.
Identifiers: Watershed studies, Surface hydrology.

A new technique is presented for the solution of the unsteady flow equations for the ideal case of a constant-slope open channel with lateral inflow. Lateral inflow is assumed to be constant with distance but variable in time. The proposed techniques may be applied to the solution of problems of surface runoff. The one-dimensional, non-linear, partial differential equations of motion and continuity are derived and transformed into a system of ordinary, nonlinear, differential equations. This set of equations may then be solved numerically to give the velocity, depth of flow, or area, at any point along the channel. The numerical procedure consists of solving the equations for the derivatives of the velocity and depth, or area, with respect to time at each nodal point along the channel for a particular time. Starting with the known initial conditions and utilizing Taylor's series, the velocity and the depth, or the area of flow, can be predicted after an increment of time. The numerical solution was shown to converge.

REGIONAL DRAFT STORAGE RELATIONS IN WEST-CENTRAL ALABAMA,
U. S. Geological Survey, Tuscaloosa, Alabama, Water Resources Division.
Patrick O. Jefferson.
U S Geol Surv Prof Pap 600-C, pp C182-C184, 1968. 3 p, 4 fig, 1 tab, 1 ref.

Descriptors: *Water resources, *Surface waters, *Draft-storage curves, *Water yield, *Safe yield, Water storage, Watershed management, Streamflow, Discharge (Water), Alabama.
Identifiers: *Draft-storage relations, Median 7-day low flow.

In a 10-county region of west-central Alabama, within-year storage can provide draft rates ranging up to 50% of the average flow of streams. Storage requirements can be estimated on the basis of average flow alone, but the standard error of estimate can be reduced by including median 7-day low flow as a secondary variable. Multiple regressions for estimating storage requirements for draft rates of 25 to 50% of the average flow are combined in a single coaxial diagram which has regional application. Draft-storage frequency curves and curves showing regional relations between storage required and average flow are presented. (Knapp-USGS)
W69-00682

SERIAL CORRELATION OF ANNUAL FLOODS,
U S Geological Survey, Washington, D. C., Water Resources Div.
P. H. Carrigan, and Carl S. Huzzen.
Proc of the 12th Congr, Int Hydrol Symp, pp 322-328, Sept 1967. 7 p, 4 fig, 1 tab, 6 ref.

Descriptors: *Time series analysis, *Floods, *Streamflow, *Stochastic processes, Markov processes.
Identifiers: Annual floods.

A study of streamflow records of 45 gaging stations, well distributed over the United States, was undertaken to determine serial correlation of annual floods, to seek stochastic processes most descriptive of serial correlation, and to relate serial correlation to hydrologic variables. The first- and second-order serial correlation coefficients for annual floods appear to be greater than zero at a significant number of the sites considered in this study. No dominant stochastic process was found in study of these records. The possibility of serial correlation of annual floods appears to increase if base flow enhances the magnitude of flood discharges. First-order serial correlation coefficients of annual flows and of annual floods seem to be directly related. (Knapp-USGS)
W69-00686

RESISTANCE TO FLOW IN SAND CHANNELS,
U S Geological Survey, Fort Collins, Colorado.
Everett V. Richardson, and Daryl B. Simons.
Proc of the 12th Congr, Int Ass for Hydraul Res, pp 141-150, Sept 1967. 10 p, 4 fig, 12 ref.

Descriptors: *Alluvial channels, *Channel morphology, *Flow resistance, *Regime, Roughness (Hydraulic), Equations.
Identifiers: Navier-Stokes equation.

Relations are presented for estimating resistance to flow for plane bed, rippled bed, dunes, and antidunes. With plane bed, energy dissipation results from grain roughness. With ripples, it results from form roughness. With dunes, it results from form roughness and grain roughness if dunes are small in comparison to the scale of the system. If dunes are so large that they cannot be considered roughness elements but changes in cross section, then energy dissipation also results from the acceleration and deceleration of the flow as well as from the grain and form roughness. With antidunes, energy dissipation results from grain roughness, acceleration and deceleration of the flow and breaking waves. There is not a general resistance-to-flow equation for equilibrium flow in a sand channel because (1) bed configuration determines whether the flow is uniform or nonuniform and steady or unsteady; (2) there are 4 types of energy dissipation; and (3) there is a range in shear stress (transition) where bed form may range from dunes to plane bed or antidunes. A relation is also given for predicting bed from given stream power and sand size. (Knapp-USGS)
W69-00687

FLOODS FROM HURRICANE BEULAH IN SOUTH TEXAS AND NORTHEASTERN MEXICO, SEPTEMBER-OCTOBER 1967,
U S Geological Survey, Austin, Texas, Water Resources Division.
R. V. Grozier, D. C. Hahl, and A. E. Hulme.
Tex Water Develop Board Rep 83, 195 p, Sept 1968. 38 fig, 14 tab.

Descriptors: *Floods, *Texas, *Mexico, *Historic flood, *Hurricanes, *Rain, Discharge (Water), Regional floods, Stage-discharge relations, Rio Grande.
Identifiers: *Hurricane Beulah, Estuary dilution, Record rainfall.

Floods produced by Hurricane Beulah during Sept and Oct 1967 exceeded maximum previous stages on 5 Texas river basins by amounts ranging from 2.7 ft at Guadalupe River near Tivoli to 9.2 ft at Arkansas River near Skidmore. Medio Creek near Beeville had a discharge 4.12 times the previous maximum and 6.0 times the 50-yr flood. The inflow to Lake Corpus Christi was over 4.5 times the volume of the lake. Corpus Christi Bay received 1.5 times its normal volume and San Antonio bay, 3 times its volume. Most of the saline water was flushed out. Water levels rose in shallow wells because of infiltration of floodwater and rainfall, and because of water pouring into many flooded wells. Flooding along the Rio Grande exceeded all previous maximum measurements. A 4000 sq mi area of South Texas was inundated. Rainfall of 25 in. was common in Texas and as much as 35 in. was measured in Mexico. Precipitation, discharges, water quality, and groundwater levels are tabulated. (Knapp-USGS)
W69-00690

METHOD OF VOLUME-DIVERSION ANALYSIS OF A STREAM,
U S Geological Survey, Washington, D. C., Water Resources Division.
M. R. Collings.
U S Geol Surv Prof Pap 600-C, pp C199-C203, 1968. 5 p, 4 fig, 2 tab, 3 ref.

Descriptors: *Diversion, *Water management (Applied), *Duration curves, *Prior appropriation, Hydrographs, Statistical methods.
Identifiers: Volume-diversion analysis, Millers River, Mass, Flow frequency.

A simple method is proposed for estimating the probability of the potential volume of diversion available after prior demands on flow are satisfied downstream from a selected diversion site. The volume of divertable flow obtainable in excess of a specified discharge is computed from the selected class discharge limits used in calculating flow-duration data. The magnitude and frequency of these volumes are then determined. From the analysis of mean daily flows, relations can be derived to determine (1) potential volume of diversion, (2) recurrence interval, (3) size or rate of diversion, and (4) probable number of days in a year when diversions are possible. The results of an analysis of Millers River, Massachusetts are presented in the form of frequency curves. (Knapp-USGS)

THE BOUNDARY CONDITIONS IN THE IMPLICIT SOLUTION OF RIVER TRANSIENTS,
U S Geological Survey, Washington, D. C., Water Resources Division.
Chintu Lai.
U S Geol Surv Prof Pap 600-C, pp C204-C210, 1968. 7 p, 3 fig, 7 ref.

Descriptors: *Unsteady flow, *Streamflow, *Stage-discharge relation, *Mathematical studies, *Digital computers, Computer programs, Open channel flow, Velocity.
Identifiers: *River transients, *Boundary conditions, Finite-difference methods, Implicit method.

Transient riverflow in a given reach at a particular time can be defined by partial differential equations and appropriate boundary conditions. Consideration of physical properties of the riverflow gives 4 different sets of boundary conditions. In solving these equations using the implicit method all unknowns at the advanced time line have to be found simultaneously; therefore, different combinations of known boundary data leave different sets of unknown to be solved implicitly. Computer programs have been written to handle different boundary-value problems separately. Test runs have indicated that transient flows with all 4 boundary conditions can be treated adequately, and have shown that good agreement exists between computed and observed values. The boundary conditions treated are: (1) Stages given at the upstream and downstream ends of the reach; (2) Discharges given at each end; (3) Stage given at the upstream end and discharge at the downstream end; (4) Discharge given at the upstream end and stage at the downstream end. AN IMPLICIT METHOD FOR NUMERICAL FLOOD ROUTING,
North Carolina State University, Raleigh.
Michael Amein.
Water Resources Res, Vol 4, No 4, pp 719-726, Aug 1968. 8 p, 2 fig, 1 tab, 18 ref.

Descriptors: *Digital computers, *Floods, *Flood routing, *Mathematical models, Hydraulics, Unsteady flow, Open channel flow.
Identifiers: *Implicit method, *Numerical solutions, Partial differential equations, Digital computer method.

In application to flood routing, the numerical solution of the complete equations of unsteady flow is described. This implicit method is both fast and accurate and can be established based on: (+) a centered difference scheme for representing the primary differential equations in finite difference form, and (b) simultaneous solutions of the finite difference equations for each time step. The dif-

LIBRARY U. OF I. URBANA - CHAMPAIGN

ference equations constitute a system of nonlinear algebraic equations that can be solved on a digital computer by rapidly convergent procedures based on the generalized Newton iteration method. A distinguishing feature of the linear system is that the matrix of coefficients contains few nonzero elements, which facilitate fast solutions. It was found that when the implicit method was applied to a number of representative problems in flood flows, the computations were stable and converged rapidly toward the final solutions. The method can be efficiently applied to the study of flood movement. (Llaverias-USGS)

2F. Groundwater

CORRELATION OF TRACE ELEMENTS IN GROUND WATER AND AQUIFERS WITHIN THE CONNECTICUT RIVER BASIN.

Water Resour Res Inst, Conn, May 1967. 4 p. OWRR Project A-007-Conn.

Descriptors: *Trace elements, *Aquifers, *Groundwater, Groundwater geology, Water quality, Minerals, Spectroscopy, Bedrock, Rocks, Chemical analysis.
Identifiers: Connecticut River Basin.

This paper is a notice of the completion of a OWRR research project. Ultraviolet emission spectrography was employed to obtain reasonably precise semiquantitative data for some trace elements of certain minerals from various bedrock units in Connecticut. The elements determine were Ag, Ba, Be, Ca, Cu, Ga, Mn, Pb, Sn, Ti, and Zr. Minerals analyzed were quartz, feldspars, biotite, and magnetite. Most of the elements (Ag, Ba, Be, Ga, Pb, Sn, and Ti) showed concentration variations that were systematically related to specific rock units. The above data constitute partial achievement of the immediate objectives of this project, which include: (1) the determination of trace element concentrations in minerals from bed rock units and in ground-water samples from various parts of Connecticut; and (2) sampling and analyses of minerals from aquifers (bedrock units and unconsolidated deposits) and ground water from the Connecticut River Basin and their correlation based on trace element concentrations.

GROUND-WATER HYDROLOGY OF THE SEVIER DESERT, UTAH,
U S Geological Survey.
R. W. Mower, and R. D. Feltis.
U S Geol Surv Water-Supply Pap 1854, 75 p, 1968. 15 fig, 7 plate, 9 tab, 38 ref.

Descriptors: *Water sources, *Groundwater recharge, *Utah, Water quality, Evapotranspiration, Groundwater movement.
Identifiers: *Sevier Desert.

A cooperative hydrologic study was made of the Sevier Desert to determine amount and location of recharge, discharge, pumpage, water storage, and pumping effects on water levels. Most recharge to groundwater reservoirs results from water entering alluvial fans as percolation from streams, irrigation ditches, and irrigated fields. Leakage from the Central Utah Canal is a major source of recharge to the water-table aquifer. Most groundwater is suitable for domestic and stock uses. Water discharged by withdrawal from wells increased from 2,000 ac ft in 1950 to 30,000 ac ft in 1964 and water levels declined from 4 ft to 7 ft for the same period. In the 440,000 acres of the Sevier Desert that support phreatophytes, and estimated 135,000-175,000 ac ft of groundwater is consumed by evapotranspiration. Consumptive waste of groundwater by vegetation of little or no value (principally saltcedar and pickleweed) is not great but will increase if saltcedar spreads into native meadow pastures, along canal and drain banks, and into surface reservoirs. About 120,000 ac ft of water can be obtained from storage by lowering the artesian aquifer water level 20 ft. (Llaverias-USGS)

GEOPHYSICAL LOGGING AND HYDRAULIC TESTING, PAHUTE MESA, NEVADA TEST SITE,
U S Geological Survey, Las Vegas, Nevada.
Richard K. Blankennagel.
Ground Water, Vol 6, No 4, pp 24-31, July-Aug 1968. 8 p, 9 fig, 11 ref.

Descriptors: *Borehole geophysics, *Logging (Recording), *Hydraulic properties, *Water wells, Electrical well logging, Tracers, Flowmeters.
Identifiers: *Testing, Packers, Caliper logs, Temperature logs.

Studies performed by the U S Geological Survey for the Atomic Energy Commission in relation to underground nuclear explosions at the Nevada Test Site involve geophysical logging and hydraulic testing in deep exploratory holes at Pahute Mesa. Electric logs are used to identify lithology, for correlation and to locate potential water-bearing zones, usually fractured welded tuff and rhyolote. Caliper logs are essential to determine borehole diameter for selection of packer seats, for tracer-survey computations, and for proper interpretation of other geophysical logs. Temperature logs indicate water movement and water entry into boreholes. Fluid resistivity logs are made at the same time as spontaneous potential logs to aid in spontaneous potential interpretation and to detect zones of fresh water entry. Tracer surveys and flow meters are used to study water circulation. Hydraulically inflated straddle packers are used in water injection and swabbing tests for water yielding potential of isolated intervals in the borehole. Static water levels of selected intervals are also obtained. (Knapp-USGS)
W69-00434

THE RELATIONSHIP BETWEEN SPECIFIC CAPACITY AND AQUIFER TRANSMISSIBILITY IN THE HOUSTON AREA, TEXAS,
U S Geological Survey, Houston, Texas.
R. K. Gabrysch.
Ground Water, Vol 6, No 4, pp 9-14, July-Aug 1968. 6 p, 6 fig, 1 tab, 4 ref.

Descriptors: *Water wells, *Aquifers, *Specific capacity, *Pump testing, *Transmissivity, Well screens, Aquifer characteristics, Hydraulics, Storage coefficient.
Identifiers: *Well efficiency, Pumping tests, Recovery tests, Well development, Houston, Texas.

Tests of wells owned by Houston, Texas were analyzed and comparison of the results with theoretical transmissibility-specific capacity curves showed that the wells are not completely developed. Average thickness of sand beds screened ranges from 340-605 ft in the 7 well fields. The 55 tests showed ranges in aquifer permeability from 125-432 gpd per sq ft, and ranges in average transmissivity from 96,000 to 172,000 gpd per ft. Measured specific capacities were based on 1-hour recovery tests. Shorter tests showed misleading higher values. All were lower than calculated theoretical values. Wells drilled since 1955 averaged 69% of theoretical transmissivity and wells drilled before 1955 averaged 72%. The better performance of the older wells may be because of gradual development by pumping through the years. It is suggested that well drillers employ 1-hour or longer, properly conducted recovery tests to determine whether wells are properly constructed and developed. (Knapp-USGS)
W69-00435

POINT DILUTION METHODS OF INVESTIGATING GROUND WATER FLOW BY MEANS OF RADIOISOTOPES,
Walter Drost, Dietmar Klotz, and Arnd Koch.
Water Resour Res, Vol 4, No 1, pp 125-146, Feb 1968. 22 p, 15 fig, 3 tab, 30 ref.

Descriptors: *Tracers, *Radioactive isotopes, Dyes, Ground water, *Wells, Dams, Permeability, Piezometers, Porous materials, Model tests, Underseepage, Field tests, Seepage, Bibliographies, *Groundwater flow.
Identifiers: Radiation detectors, Gold isotopes, Foreign testing, West Germany, *Dilution method, *Water wells.

The distortion of the flow field by a well must be known to apply the point dilution method of measuring ground-water flow by tracers. The distortion can be calculated if aquifer permeability is less than or equal to gravel pack permeability, and if gravel pack permeability is less than or equal to well screen permeability. The tracer must be adequately mixed during the dilution procedure. Experiences obtained from model tests are applied to field investigations. Peak-to-peak and total count methods were used in wells having a vertical flow to determine depths and rates at inflow and outflow. The direction of ground-water flow was determined by the point dilution method; a radioactive tracer is injected into the well screen water column and measured by a collimated probe that is sensitive to the direction of incident radiation. Using tracers that are fixed on the soil is advisable; Gold 198 is the most suitable tracer. Strong, vertical currents in a well present a serious obstacle to field measurements of the rate and direction of ground-water flow. (USBR)

WATER-LEVEL PROBE,
National Reactor Testing Station, Idaho Falls, Ida.
K. H. McGary, M. Wilhelmsen, and P. Boren.
J Hydrol, Vol 6, No 3, pp 225-236, June 1968. 12 p, 8 fig.

Descriptors: Instrumentation, Measuring instruments, Wells, Sensors, Water surface, Water surface profiles, *Liquid level gages, Electrodes, Recording systems, Electrical conductance, Ground water, Phreatic line, Water table, *Water stage recorders.
Identifiers: *Water level, Water wells, Probes (Instruments).

A water-level probe designed for recording surface levels in wells can be applied to any system requiring monitoring and control of liquid levels. Desirable features of the instrument were: a probe for small-diameter well casing; self-contained, lightweight, and rugged; operable over long periods without battery replacement or maintenance; sealed against wind, dust, rain, and snow; able to withstand temperature variations from 100 deg F to minus 40 deg F; and exhibiting an accuracy of plus or minus 0.02 ft at well depths of 600 ft. The major problem encountered was designing a sensitive and reliable probe. Probes using water conductivity as the sensing mechanism became corroded, lost conductivity, and gave erroneous readings because of water and mineral salt bridging the electrodes. Three types of probes were developed to overcome these problems. One was a float-operated mercury switch not dependent on water conductivity; the other 2 were conductive probes using stainless steel

with long pointed electrodes. Design details, applications, and precautions are given for using the probes. (USBR)

TIME VARIANT GROUND WATER FLOW BY RESISTANCE NETWORK ANALOGUES,
Birmingham Univ, Great Britain.
Robin Herbert.
J Hydrol, Vol 6, No 3, pp 237-264, June 1968. 28 p, 17 fig, 2 tab, 12 ref.

Descriptors: Ground water, *Groundwater flow, *Electric analogs, Time, Steady flow, Analogs, Two-dimensional, Water table, *Drawdown, Models, Movements, Mathematical analysis, Three-dimensional, Wells, Electrical resistivity.
Identifiers: Mathematical models, Great Britain.

A sudden water table movement may cause earth dams to collapse, riverbanks to fall, wells to run dry, or heavy machinery to bog down in saturated soil. A general method for simulating unconfined ground-water flow is available for predicting and minimizing such an occurrence. Factors governing water table movement are described, and a method for studying the flow is developed. The technique represents the continuous fall of the water table in a stepwise manner; a method is described for smoothing out discontinuities induced by such a technique. The solution to a simple problem is presented with experimental details to demonstrate how the technique is applied to a network analog modeling time-variant flow. The technique is tested against alternative solutions of flow systems in: (1) two dimensions, (2) three dimensions, and (3) radial symmetrical form. Accuracy of the analog solution is high. Isolated solutions of certain idealized unconfined flow systems existed prior to this work; however, any three-dimensional time-variant unconfined ground-water system may be represented, using the technique described. ANALYSIS AND PREDICTIVE METHODS FOR GROUND WATER FLOW IN LARGE HETEROGENEOUS SYSTEMS,
Battelle Memorial Institute, Richland, Wash.
R. William Nelson, and Dennis B. Cearlock.
Pap, Proc Ser No 4, Symp Amer Water Resour Ass, San Francisco, Calif pp 301-318, Nov 1967. 18 p, 9 fig, 12 ref.

Descriptors: *Ground water, *Groundwater flow, Permeability, Aquifers, Porous materials, Heterogeneity, Water table, Forecasting, Mathematical analysis, *Boundary values, Computer programming, Analysis, Reservoirs, Energy dissipation, Hydrology.
Identifiers: Ben Franklin Resvr, Wash, Hanford Project, Wash, Boundary conditions, Groundwater management, Mathematical models.

Ground-water flow in heterogeneous porous materials was analyzed to determine the effects on the ground-water system of the proposed Ben Franklin Reservoir in Wash. The analysis method has 3 parts: (1) in-place determination of invariant flow system characteristics; (2) predicting new flow conditions from altering boundary conditions; and (3) using predicted results to answer practical problems such as the possible movement of contaminants. The paper discusses a new energy dissipation method for in-place permeability measurement to determine distribution. Permeability distribution and boundary conditions are used to set up a new boundary value problem. The boundary value problem interrelates all pertinent variables and provides a skeleton model for predicting future ground-water flow conditions. The solution gives new ground-water potentials resulting from changes in boundary conditions. The analysis sequence gives a better representation at actual field conditions and offers advantages of directly specifying field data required, which will realize savings by eliminating nonessential traditional field measurements. Identifiers: Evaluation, Transmissibility coeff, Transmissivity, Theis nonequilibrium method, Leaky aquifers, Depth.

Complicated ground-water flow systems can be studied in detail by applications of electric analogs or digital computers. Aquifers and their response to applied stress could not be studied economically 15 yr ago. Examples of recently developed techniques are discussed. Graphs show: (1) comparisons of Theis and Hantush analyses of recovery data; (2) auxiliary-type curves from Boulton, showing match to drawdowns observed at midthickness in an unconfined aquifer; (3) apparent specific yield from measurements of moisture content; and (4) depth vs temperature in a formation having low permeability where ground-water flow is vertical. RECHARGE FROM INDUCED STREAMBED INFILTRATION UNDER VARYING GROUND-WATER-LEVEL AND STREAM-STAGE CONDITIONS,
Minnesota Univ., Minneapolis.
William C. Walton, David L. Hills, and Gordon M. Grundeen.
Water Resour Res Center Bull 6, June 1967. 43 p, 19 fig, 3 tab, 19 ref. OWRR Project A-014-Minn.

Descriptors: *Surface-groundwater relationships, Hydrographs, *Safe yield, Influent streams, Saturated flow, *Streambeds, *Streamflow, Aquifers, Artificial recharge, Permeability, Storage coefficient, Water table, Drawdown, Groundwater recharge, Observation wells, *Induced infiltration, *Analog computers.

Recharge from induced streambed infiltration can be estimated with data on streambed infiltration rates, surface water temperatures, ground water levels, and stream stages. However, estimates of recharge are not valid unless it is recognized that: rate of leakage through a streambed increases in direct proportion to declines in water table until water levels have receded to stages below the streambed; after the water table recedes below the streambed, rate of leakage remains constant and at a maximum value, provided stream stage and temperature do not change. Incorrect water table declines and incorrect potential yields of well fields will be computed if it is assumed that induced streambed infiltration continuously increases in direct proportion to drawdown beneath the streambed regardless of water table stage. An aquifer-stream system for which hydrogeologic data are available was studied using electric analog computers and analytical methods. Results of these computer studies demonstrate that much greater drawdowns are computed for an aquifer-stream system when maximum infiltration conditions are taken into account than when maximum infiltration conditions are ignored.

DESIGN AND CONSTRUCTION OF A HORIZONTAL VISCOUS FLOW MODEL,
Delaware Univ., Newark.
R. D. Varrin, and H. Y. Fang.
Lehigh Univ Affiliated Inst, Ground Water, Vol 5, No 3, July 1967. 7 p, 3 fig, 22 ref. OWRR Project A-004-Del.

Descriptors: Bibliographies, *Analog models, *Viscous flow, Ground water, *Groundwater flow, *Aquifers, Transformations, Model tests, Fluid flow, Porous media, Water wells, Drainage, Permeability, Underground water storage.

This horizontal viscous flow model with infinite areal extent can be used for most well flow problems, whether 2-dimensional or 3-dimensional, steady or nonsteady, single aquifer or multiaquifer. This model can be used in the field of soil mechanics for subsurface drainage problems. The design includes scale model analysis and the application of conformal mapping techniques for simulating an ideal aquifer. Construction, calibration, and test procedures for the model are described. The apparatus has proved to be a valuable research tool and an excellent teaching aid.

HYDRAULIC MODEL STUDY OF NONSTEADY FLOW TO MULTIAQUIFER WELLS,
Princeton Univ., New Jersey.
Roger J. M. De wiest.
J Geophys Res, Vol 71, No 20, pp 4799-4810, Oct 1966. 12 p, 11 fig, 17 ref. OWRR Project A-004-Del.

Descriptors: *Hydraulic models, Model studies, *Non-uniform flow, *Aquifers, Water wells, Wells, Hydraulics, Mathematical models.

This paper appraises an analytical study of nonsteady flow to multi-aquifer wells by means of the flow in a horizontal Hele-Shaw apparatus. Design and calibration features of the analog are described in detail for a well which penetrates 2 parallel overlying aquifers of infinite extent. The agreement between analytical solutions derived from a mathematical model, neglecting well losses, and experimental results from the physical analog is found to be very good.

GEOPHYSICAL PROSPECTING FOR GROUND WATER IN THE PIEDMONT AREA, ALABAMA,
Alabama Geological Survey and Auburn Univ.
Thomas J. Joiner, James C. Warman, and W. Leon Scarbrough.
Geol Survey Alabama Circular 42, 1967. 48 p, 17 fig, 1 tab, 14 ref. OWRR Project B-003-Ala.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Ground water, *Groundwater geology, *Geophysics, Subsurface investigations, Explorations, Seismic investigations, Electrical resistivity, Magnetic properties, Alabama.
Identifiers: Seismic refraction, Heflin, Alabama, Piedmont.

The Piedmont is underlain by igneous and metamorphic rocks making location of ground water supplies very difficult. Ground water occurrence and movement in the Piedmont is controlled by topography, recharge and discharge, rock type, fracture systems, and type and thickness of saprolite. Approximately 12 sq mi in the Heflin area, Cleburne County, Alabama, were included in this study. Fractures within bedrock are the most effective avenues for ground water movement in this area, but domestic supplies can be produced from saprolite and alluvium overlying bedrock. Thick saprolite contributes to bedrock-fracture production by absorbing water from streams and rainfall and releasing it slowly to underlying fractures. Seismic methods were used with geologic, hydrologic, and topographic data to locate and define favorable areas for drilling. Faults or fracture systems appear to correlate with depressions on bedrock surfaces associated with thick saprolite zones. Seismic data indicate 25 prospective areas for test drilling. Resistivity data were used to confirm seismic depths to bedrock, and to locate gravelly zones in buried stream channels. Some of the buried alluvium is thick enough to be considered a potential aquifer.

GROUND-WATER CONTRIBUTION TO STREAMFLOW AND ITS RELATION TO BASIN CHARACTERISTICS IN MINNESOTA,
Minnesota Univ., Minneapolis.
E. A. Ackroyd, W. C. Walton, and D. L. Hills.
Minn Geol Surv Rep Invest 6, 1967. 36 p, 13 fig, 6 tab, 17 ref. OWRR Project A-009-Minn.

Descriptors: *Groundwater geology, *Groundwater, *Surface-groundwater relationships, Lakes, Forests, Wetlands, Hydrographs, Runoff, *Base flow, *Watersheds, *Minnesota, Drainage basins, *Streamflow.

Estimates of annual ground-water contribution to streamflow in 38 drainage basins of Minnesota by use of standard streamflow hydrograph separation methods permit determination of relations between ground-water runoff and such basin characteristics as geologic environment, precipitation and temperature, and percentage of lake and wetland cover. Generalized conclusions derived from analysis of the data are that ground-water runoff is: (1) least from glaciated basins that have surficial lake bed sediments or gray-drift ground moraine immediately underlain by relatively impermeable bedrock, and (2) greatest from glaciated basins that have surficial deposits immediately underlain by permeable bedrock or that have thick surficial loess deposits immediately underlain by permeable bedrock. Ground-water runoff is much greater from glaciated basins having red drift than from basins having gray drift. The rate of ground-water increases as annual precipitation increases. Lakes and wetlands sustain and regulate streamflow during rainless periods; if they were absent sustained streamflow from northern parts of the state would be greatly reduced.

FACTORS AFFECTING SOLUTION OF MANGANESE IN WELL WATER,
Rhode Island Univ., Kingston, Mech. Eng. and Applied Mech.
Frank J. DeLuise.
Water Resour Res Rep A-003-RI, June 1967. 11 p, 7 fig. OWRR Project A-003-RI.

Descriptors: *Manganese, *Wells, *Water, *Solubility, Water quality, Aquifers, *Groundwater, *Water wells.

This study was to determine the extent to which several factors affect the solubility of manganese in well water. Factors investigated were those which might normally or abnormally, because of pollution, be present in aquifer. The presence of carbon dioxide, organic material and microorganisms were determined to be the most significant factors. Most of the laboratory studies were conducted using manganese monoxide, manganese dioxide (most common in soils), and manganese carbonate. The study demonstrates that biological fermentation as an intracellular activity can dissolve manganese, and led to the suggestion of a manganese cycle in impoundment water.

NUMERICAL MODELING OF GROUND WATER FLOW,
Kansas Univ., Lawrence and Manhattan.
C. F. Weinaug, and D. W. Green.
Completion Rep, Water Resour Res Inst, Univ Kans, June 1966. 29 p, 15 fig, 3 ref, 2 append. OWRR Project A-002-Kan.

Descriptors: Groundwater, Aquifers, *Groundwater movement, Numerical analysis, Mathematical studies, Mathematical models, Computer programs, Digital computers, Groundwater recharge, Seepage, Infiltration.

A mathematical model of ground-water flow is being developed. The model basically consists of the numerical solution of the partial differential equations describing 2-phase, 2-dimensional flow in porous media, e.g., waterflow in the presence of partial air saturation. A digital computer is required in the solution technique. The mathematical model will be useful for such studies as an evaluation of methods of artificial recharge of ground-water aquifers or the determination of rate of flow between adjacent aquifers.

SEEPAGE FLOW THROUGH AN EARTH DAM,
Georgia Inst. of Tech., Atlanta, Civil Engineering Sch.
M. R. Carstens, and George D. May.
Water Resour Center, Ga Inst Tech, July 1966. 75 p, 21 fig, 3 tab, 11 ref. OWRR Project B-003-Ga.

Descriptors: *Groundwater movement, *Embankments, Seepage, *Earth dams, Impervious soils, Drainage systems, Isotrophy, Free surfaces, Water table, Phreatic lines, Saturation, Groundwater barriers, *Flow-nets, Two-dimensional, Homegeneity, Soil mechanics.
Identifiers: Charmonmans method, Laplaces equation, Cauchy-Riemann equation.

Charmonman's method for the numerical solution of Laplace's equation in two dimensions is described. With Charmonman's method, the solution is obtained in the complex-potential plane and is transformed back to the physical plane by use of the Cauchy-Riemann equations. The method is well suited for numerical solution of seepage problems which are bounded by streamlines and equipotential lines because the flow domain is rectangular in the complex-potential plane. Seepage flows involving a free surface are readily solved in this manner because the boundary conditions can be easily defined. The scheme is illustrated by numerical solution for seepage flow through an earth dam placed on an impervious base, having an upstream face of constant slope, and having a drainage blanket. Both the flow nets and the flow-net coordinates are presented for embankment slopes of 1 (vertical) on 1 (horizontal), 1 on 2, 1 on 3 and 1 on 4 and for three different penetrations of the drainage blanket. Comparison is made with a widely used approximation--a parabolic free surface.

NOTES ON THE GEOHYDROLOGY OF THE DAKOTA SANDSTONE, EASTERN NORTH DAKOTA,
U. S. Geological Survey, Grand Forks, North Dakota.
T. E. Kelly.
U S Geol Surv Prof Pap 600-C, pp C185-C191, 1968. 7 p, 3 fig, 17 ref.

Descriptors: *Hydrogeology, *Sandstones, *Aquifers, *North Dakota, Transmissivity, Permeability, Water quality, Water yield, Artesian wells.
Identifiers: *Dakota sandstone.

In eastern North Dakota the Dakota Sandstone consists primarily of unconsolidated fine sand. Transmissibilities are less than 50,000 gals per ft, and the coefficient of storage is about 0.0004. Total dissolved solids and fluoride content differ considerably from place to place; the silica concentration is lower than in water from the glacial drift. Maps show configuration of the top of the Dakota Sandstone, total dissolved solids concentration of water from the uppermost producing sands. The water quality data suggest that a major source of recharge is upward leakage from the underlying Red River Formation. (Knapp-USGS)

RELATION BETWEEN AQUIFER CONSTANTS AND ESTIMATED STRESS ON AN ARTESIAN AQUIFER IN EASTERN MONTANA,
U. S. Geological Survey, Denver, Colorado.
O. James Taylor.
U S Geol Surv Prof Pap 600-C, pp C192-C195, 1968. 4 p, 5 fig, 9 ref.

Descriptors: *Aquifers, *Confined water, *Stress, *Strain, Overburden, Compressibility, Permeability, Porosity, Potentiometric level, Storage coefficient, Montana.
Identifiers: *Aquifer constants, Fox Hills-Basal Hell Creek aquifer.

Studies show that the Fox Hills-basal Hell Creek artesian aquifer in eastern Montana is subjected to different vertical stress related to differences in the weight of the overburden, which is partly supported by the artesian pressure at the top of the aquifer. Aquifer tests indicate values of the coefficient of permeability which appear to correlate with the estimated vertical stress on the aquifer at the aquifer-test sites. The coefficients of storage also changes with the estimated vertical stress on the aquifer, according to data from sonic logs and theoretical studies. Accordingly, the coefficients of permeability and storage of the aquifer vary in space and may change during aquifer development. Graphs and diagrams show vertical stress and the

relation between permeability and stress on the aquifer skeleton. (Knapp-USGS)

SUMMARY OF GROUND-WATER HYDROLOGIC DATA IN MICHIGAN IN 1967,
U S Geological Survey, Lansing, Mich, Water Resources Division.
P. R. Giroux, and G. C. Huffman.
Michigan Dep of Conserv, unnumbered Bull, 108 p, 1968. 39 fig, 5 tab, 86 ref.

Descriptors: *Data collections, *Hydrologic data, *Water levels, *Water yield, *Water quality, Hydrographs, Water wells, Water level fluctuations, Michigan.
Identifiers: Periodic observations.

Records of groundwater levels in the principal aquifers, records of pumpage, summaries of public water supply facilities, and the effects of precipitation on groundwater levels are compiled for Michigan through 1967. Records of water levels in areas of heavy pumpage and in areas where changes are principally from natural influences are illustrated or tabulated to allow comparison between these types of water-level fluctuations. The water-levels and related data provide a day-to-day record for the evaluation of available groundwater supplies. The long-term records serve as a framework to which short-term records may be related. Observation well records include water levels, well location, depth, elevation, aquifer, and extremes of water level in the past record and in 1967. Pumpage by most major water users in 1967 is tabulated. Hydrographs are used to illustrate water level changes. Well yield, pumpage, storage facilities, treatment, quality of water, per capita use and trends of water levels are summarized. (Knapp-USGS)

LABORATORY EVALUATION OF SELECTED RADIOISOTOPES AS GROUND-WATER TRACERS,
Texas A and M University, College Station, Texas.
A. Ray Jennings, and Melvin C. Schroeder.
Water Resources Res, Vol 4, No 4, pp 829-838, Aug 1968. 10 p, 2 fig, 3 tab, 16 ref.

Descriptors: *Tracers, *Radioisotopes, *Groundwater, Movement, Velocity, Distribution pattern, *Ion exchange, Adsorption.
Identifiers: *Groundwater tracers, Radioactivity.

Tracer appearance results from movement along the most direct flow path, and thus arrival of the maximum concentration is the best index for determining average water velocity. Antimony 121, cerium 141, chromium 51, indium 114, ruthenium 103, and strontium 85 in chelate form were tested, as the unchelated ions are subject to greater delay by adsorption and ion exchange. Distribution-coefficient measurements were made under static conditions for crushed illitic shale and limestone. These measurements can be used to predict the elution history of a tracer from an exchange column. Comparisons of the predictions, the tracer elution histories, and elution histories for chloride pulses indicate that chelated chromium 51 is an adequate groundwater tracer. Average velocity of groundwater is equal to the sum of the tracer velocity plus the product of the tracer velocity, the distribution coefficient, and the bulk density of the aquifer divided by its effective porosity. The distribution coefficient for an ideal tracer is zero; the average velocity of this tracer is equal to the average groundwater velocity. (Knapp-USGS)

2G. Water in Soils

SEASONAL MOVEMENT OF PERCOLATING WATERS TO THE GROUND WATER TABLE UNDER HARDWOOD FORESTS IN MICHIGAN,
Michigan State Univ, East Lansing.
Donald P. White.
Term Rep, Dep Forest, Mich State Univ, June 1967. 51 p, 7 fig, 9 tab, 5 ref, append. OWRR Project A-006-Mich.

Descriptors: Hydrologic cycle, *Ground water, Artesian water, Soil moisture, Aquifers, Observation wells, *Water table, *Deep percolation, Precipitation (Atmospheric), Seepage, Field capacity, Michigan, Wells, Forest soils.
Identifiers: Piezometric surface, Soil water storage.

Hydrologic and geologic investigations of ground water at two forested sites in south-central Michigan indicated that direct measurement of recharge to the ground water table by recording wells was greatly confounded by artesian aquifers and uncontrollable regional hydrologic effects. A soil moisture budget for a period of subnormal precipitation, 1961 and 1967, was determined and ground water recharge estimated at one of the study sites. The annual cyclic pattern is similar for each year, but varies in magnitude of fluctuations dependent upon quantity and distribution of precipitation. Precipitation during the study period was 68% of normal. Infiltration of precipitation during growing season normally does not penetrate to depths greater than 3 ft. Depletion occurs at all depths within the measured 9-ft profile but not at equal rates. Changes in total soil moisture storage are partitioned into recharge, evapotranspiration, and deep seepage losses. The deep seepage component is estimated from the total soil moisture depletion curve and from assumed evapotranspiration rates. Deep seepage losses account for 1.31 in. of precipitation available as ground-water recharge during the growing season.

AN ANALYSIS OF THE VERTICAL INFILTRATION OF WATER INTO SOIL COLUMNS,
Arizona Univ., Tucson.
John L. Thames, and D. D. Evans.
Water Resources Res, Vol 4, No 4, pp 817-828, Aug 1968. 12 p, 10 fig, 4 tab, 8 ref.

Descriptors: *Infiltration, *Soil, *Porous media, *Soil density, Regression analysis, Flow characteristics.
Identifiers: *Flux equations, Vertical water infiltrations.

To investigate the behavior of soil water movement during infiltration and thereby determine the applicability of flux equations involving soil water content gradients as the apparent driving force, an experimental study was made of vertical infiltration of water. Sandy-loam and silt-loam soil materials were used as experimental media. Water was allowed to enter air-dry columns of soil at a small constant suction, and the subsequent distribution was followed with a gamma radiation attenuation device. An analytical expression of water content as a function of depth and time was obtained by multiple regression analysis, from which it was possible to determine the instantaneous flux and the water concentration gradient at given water contents. Nonlinearity at low water gradient was evidenced for both soils throughout a wide range of water contents; the magnitude and direction of departure from linearity were similar for both soils. A new empirical flow equation was obtained by modifying the diffusivity equation for unsaturated flow. Under this modification, derived by raising the water-content gradient to a power greater than unity, the parameter analogous to soil-water diffusivity becomes a function of both water content and water-content gradient. A NUMERICAL METHOD FOR ESTIMATING INFILTRATION, REDISTRIBUTION, DRAINAGE AND EVAPORATION OF WATER FROM SOIL,
Agricultural Research Service, Fort Collins, Colo; University of Illinois, Urbana.
R. J. Hanks, and A. Klute.
Pap 68-214, Amer Soc Agr Eng 1968 Annu Meet, Logan, Utah, June 1968. 16 p, 7 fig, 1 tab, 8 ref.

Descriptors: *Numerical method, *Infiltration, Drainage, *Evaporation, Moisture content, Soils, *Soil moisture, Computer programming, Boundary values, Hysteresis, Water table, Diffusion, Soil science, Wetting and drying tests.
Identifiers: Soil columns, Soil moisture movement, One-dimensional, *Soil-water relationship, Potential evaporation, Conductivity.

A numerical method was developed for estimating one-dimensional infiltration of water into soil where water added by precipitation at the surface was equal to or greater than the infiltration rate. The method estimated redistribution of water within the soil after precipitation had stopped, taking into account hysteresis in the water content-pressure relation. Drainage into a water table was considered. The method allowed for evaporation at a rate determined by external climatic conditions or at a rate determined by internal soil conditions. Graphs are given of: (1) water content-pressure relations; (2) cumulative flow-time relations and water content profiles for an infiltration, redistribution, evaporation problem; (3) water content profiles after redistribution, using wetting and drying curves with and without hysteresis; and (4) cumulative flow, water content profiles, and pressure profiles for a drainage-evaporation problem. EXPERIMENTAL EVALUATION OF INFILTRATION EQUATIONS,
Purdue Univ, Lafayette, Ind.
R. W. Skaggs, L. F. Huggins, and E. J. Monke.
Pap 68-213, Amer Soc Agr Eng 1968 Annu Meet, Logan, Utah, June 1968. 26 p, 6 fig, 3 tab, 18 ref.

Descriptors: *Infiltration, *Experimental data, Analysis, Soils, Time, Soil erosion, Surface runoff, Bibliographies, Erosion, Field tests, Soil moisture, Soil physical properties, Runoff, Soil science, Agriculture, Hydrology.
Identifiers: Evaluation, Rainfall-runoff relation, *Infiltration rate, Equations, Rainfall simulators, Wetting front, Regression analysis.

An analysis of infiltration equations proposed by Green and Ampt, Hortan, Phillip, and Holtan was made using experimental data obtained in erosion studies with a plot-size rainfall simulator. An overland flow analysis was used to determine the infiltration rate-time relationship from the runoff hydrograph. Regression fits of the 4 equations to experimental data for 52 tests on 13 soils showed that all of the equations adequately described the infiltration rate-time relationship. Values of the equation parameters for each run analyzed are presented in the paper. (USBR)

GRAVIMETRIC PRESSURE CELL INVESTIGATION OF HYSTERESIS AND HYDRAULIC CONDUCTIVITIES IN SOILS,
Ministry of Agriculture, Cambridge, England and Michigan State University, Ann Arbor.
E. U. Nwa, R. J. Kunze, and E. H. Kidder.
Quart Bull of Mich Agr Exp Sta, Vol 50, No 4, pp 559-569, May 1968. 11 p, 10 fig, 2 tab, 17 ref.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Hydraulic conductivity, *Soils, *Soil moisture, *Hysteresis, Percolation, Laboratory tests, Methodology.
Identifiers: *Gravimetric pressure cell, Sandy loam.

The moisture content-pressure relationships of 5 samples of Hillsdale sandy loam and Sim's loam soils were measured, and the reproducibility of hysteresis loops was tested by using the same pressure steps for each absorption-desorption cycle. In each sample the total volume of water expelled during desorption was greater than the total volume taken in during absorption in the first run. This was caused by the smaller volume of air trapped in initial saturation; on 3 samples in subsequent runs the absorbed and desorbed moisture were equal because entrapped air remained constant. The 2 samples with high organic content absorbed more and more water in subsequent runs. It was not possible to reproduce the moisture content-suction curves. It is concluded that the history and experimental conditions must be specified when reporting the characteristic parameters for soils, and the assumption of a unique relationship between the calculated hydraulic conductivity and the moisture content was not valid for these data. 2H. Lakes

CHEMICAL QUALITY OF SURFACE WATERS IN DEVILS LAKE BASIN NORTH DAKOTA, 1952-60,
U S Geological Survey, Water Resources Division.
High T. Mitten, C. H. Scott, and Philip G. Rosene.

U S Geol Surv Water-Supply Pap 1859-B, pp B1-B42, 1968. 41 p, 9 fig, 1 plate, 11 tab, 14 ref.

Descriptors: *Water quality, *Surface waters, *Saline lakes, Salts, Chemical precipitation, North Dakota, Reclamation, Recreation demand, Data collections.
Identifiers: Devils Lake Basin, North Dakota.

The quality of water in the Devils Lake Basin, North Dakota, was studied between 1952 and 1960 to add data to earlier collections and to describe in better detail factors affecting the water quality of the area, as part of a tentative water quality and lake-level restoration plan. Lake levels have generally declined by evaporation since about 1800 and concentrations of dissolved salts reached 8,680 ppm in Devils Lake and 127,000 ppm in eastern Stump Lake. Above average rainfall raised lake levels in 1954, 1956, and 1957 to the highest levels in forty years. Concentration of salts decreased to 6,000 ppm in Devils Lake. The major dissolved constituents in the lake waters of the basin are sodium and sulfate. Salt balance computations indicate that as much as 35,000 tons of salts precipitated from Devils Lake in dry years, and in some wet years 89,000 tons were redissolved. Between 1952 and 1960, 201,000 tons were deposited on the bed of East Devils Lake, 15,100 tons in Stump Lake, and 421,000 tons in eastern Stump Lake. It is estimated that not more than 20% of the total amount deposited in the lowering of the lakes will redissolve if lake levels are raised. (Knapp-USGS)

PLANKTONIC PHOTOSYNTHESIS AND THE ENVIRONMENT OF CALCIUM CARBONATE DEPOSITION IN LAKES,
Minnesota Univ., Minneapolis, Limnological Res Center.
Robert O. Megard.
Interim Rep 2, Univ Minnesota, Jan 1968. 47 p, 7 fig, 6 tab, 33 ref. OWRR Proj A-008-Minn.

Descriptors: *Photosynthesis, *Calcium carbonate, Aquatic environment, Aquatic productivity, Eutrophication, *Lakes, Limnology, *Plankton, Algae, Bibliographies, Chemical precipitation, Ions, Biochemical oxygen demand, Minnesota, Water chemistry, Biodegradation.

Calcium and alkalinity concentrations increase in a productive lake during winter and the water at all depths becomes undersaturated with calcium carbonate. Soon after ice melt, the entire water column becomes oversaturated with calcium carbonate, and calcium and alkalinity concentrations decrease during spring, summer, and autumn. When the lake becomes thermally stratified, carbonate oversaturation increases at depths in which photosynthesis occurs, but the water at greater depths becomes undersaturated. Carbonate saturation appears controlled by the balance between carbon dioxide assimilation by planktonic photosynthesis and carbon dioxide release by respiration. Seasonal changes of calcium concentrations are balanced by chemically equivalent alkalinity changes, but magnesium concentrations do not fluctuate. Photosynthesis occurs in both the epilimnion and the metalimnion of a deeper, less productive lake. These are the only depths oversaturated with calcium carbonate during open-water season.

LIMNOLOGY, PRIMARY PRODUCTIVITY, AND CARBONATE SEDIMENTATION OF MINNESOTA LAKES,
Minnesota Univ.
Robert O. Megard.
Limnological Res Center, Interim Rep 1, Jan 1967. 69 p, 25 fig, 11 tab, 7 ref. OWRR Project A-008-Minn.

Descriptors: Sedimentation rates, *Eutrophication, *Lakes, *Primary productivity, *Plankton, Algae, *Photosynthesis, Productivity, Water quality, *Limnology, Minnesota, Water analysis, Calcium carbonate, Hypolimnion.

The report describes investigations of the regional limnology of Minn. The work has involved 3 phases: (1) a mobile laboratory was designed and outfitted; (2) standard field and laboratory methods were modified to make them more compatible with the mobility of the laboratory; and (3) a study was begun of the primary productivity and general limnology of 14 lakes in various parts of the state. The laboratory permits water samples to be analyzed at lakeside before nutrient concentrations are altered by biological activity and provides facilities for measuring the growth rates of algae and determining the fertility of lake water. The oxygen light-dark-bottle method is being used to compare algal productivity. The response of the carbonate saturometer in fresh water was tested, and the instrument was used to determine the degree of calcium carbonate saturation at different times of the year and at various depths in the lakes. The seasonal chemical changes in the lakes are described and the productivity data assembled, but there are not yet enough data for a detailed comparison of the lakes.
W69-00632

SURFACE-WATER CHEMISTRY OF SOME MINNESOTA LAKES, WITH PRELIMINARY NOTES ON DIATOMS,
Minnesota Univ., Minneapolis.
Robert C. Bright.
Limnological Res Center, Bell Museum Natur History, Univ Minn Interim Rep 3, Apr 1968. 51 fig, 44 ref, append, disc. OWRR Project B-001-Minn.

Descriptors: Bibliographies, *Minnesota, *Lakes, *Diatoms, *Algae, Ecology, South Dakota, Field investigations, Water pollution, Water sampling, *Water analysis, *Chemical analysis, pH, Sampling, On-site data collections, Limnology.

A comprehensive field study was made of diatom ecology in lakes of Minn and adjacent parts of South Dakota. The program consisted of 4 phases: (1) identification and determination of the geographic distribution and relative abundance of diatoms in the region, (2) correlation of diatom distribution and relative abundance with regional patterns of surface-water chemistry, (3) correlation of information from the first 2 phases with the composition of the diatom flora in surface sediments from each lake, and (4) application of conclusions from the first three parts to fossil diatom floras and paleoecology of lakes. Minnesota and adjacent South Dakota comprise the best area in North America for such a broad study because of the wide variety of lake types and their wide range of salinity. The ensuing discussions deal mainly with fall surface-water chemistry, possible origins of its regional pattern, its correlation with similar data from other areas, and its controlling factors.

Mississippi State Univ., State College.
W. Frank Miller.
Water Resour Res Inst Rept July 1966. 10 p, 4 tab, 22 ref, disc. OWRR Project A-005-Miss.

Descriptors: *Groundwater, *Water management, *Mississippi, Coasts, Soil moisture, *Drainage, Pine trees, *Trees.
Identifiers: *Groundwater management.

This study was designed for evaluating water balance relationships of poorly drained Coastal Flatwoods soils and determining the feasibility of water regulation to increase production of slash pine (Pinus elliotti). These extensive, poorly drained areas which once supported longleaf pine (P. palustris), are now, through cutting practice and the advent of fire protection, primarily slash pine sites. Preliminary observations in the Flatwoods indicated that in addition to an excess of ground water during the initial portion of the growing season, there was a possibility of drought conditions which might limit the growth rate of the pine in the late spring and again in the late fall. The conclusion was reached that water table regulation of the studied soils is desirable.

THE WATER ECONOMY OF TURFGRASS,
Rhode Island Univ., Kingston, Coll of Agri.
Irene H. Stuckey.
Termination Rep, Coll Agr, Univ Rhode Island, 1967. 17 p, 14 fig. OWRR Project A-009-RI.

Descriptors: *Turf grasses, Grasses, Bluegrasses, Kentucky bluegrass, Turf, Field capacity, Soil moisture, Agriculture, Plant physiology, Irrigation effects, Moisture content, *Water requirements.

Replicated plots of Kentucky bluegrass were clipped at 3/4, 1-1/2, and 3 in. Soil moisture was measured by plaster of Paris blocks at 3 in. and at 8 in. Block 1 covered with an automatic rain shelter received 1 in. of water whenever the 3 in. level in the soil dropped below 50% in half of the plots. Block 2 received rain and additional irrigation on the same basis as Block 1. Block 3 received only rain. Less water was used by the 3/4 in. cut, but these plots were weedy and unattractive and subject to erosion. Moisture from lower levels influenced readings at the 3 in. depth since they would change abruptly when the moisture level at the 8 in. level changed.

POLLEN AND DIATOMS IN SEDIMENTS OF A POST-PLEISTOCENE LAKE,
Iowa State Univ. of Science and Technology, Ames, Dep Bot Plant Pathol.
John D. Dodd, Ruth M. Webster, and Larry Wehr.

Proj Rep, Iowa State Univ Sci and Technol, Ja 1967. 9 p. OWRR Project A-008-Ia.

Descriptors: Cores, Glacial soils, Till, Carbon radioisotopes, Lake soils, *Diatoms, *Pollen, Palynology, Sediments, Marine microorganisms, *Lake beds, Aquatic animals.
Identifiers: Lake Okoboji, Iowa.

Preliminary analyses were made of a 35-ft core sample from post-glacial sediments in Miller's Bay, Lake Okboji, Iowa. A radiocarbon date of 12,700 plus or minus 200 yr for the bottom level was obtained. Comparative evaluations of diatoms and pollen have been initiated, the latter suggesting the expected transition from gymnosperm forest to mixed forest to prairie. Redeposited foraminifera, radiolarians, and coccoliths of Cretaceous origin were noted. In addition to pollen and diatoms, numerous plant and animal fragments were encountered in the sediments. These included Staurastrum (desmid), Rivularia (blue-green alga), Pediastrum (green alga), Chara zygotes, chrysophyte cysts, moss leaves, grass epidermis, bladderwort leaf hairs, insect larval mouth parts, cladoceran fragments, sponge spicules, bryozoan cysts, ostracod valves, snail shells, etc. Analyses of organic content suggested that wide fluctuations in this parameter were related to periods of environmental change.

DADE COUNTY, FLORIDA (BEACH EROSION CONTROL AND HURRICANE PROTECTION).
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 335, 103 p, 1968. 16 fig, 1 plate, 9 tab, 1 suppl, 1 append.

Descriptors: *Beach erosion, *Shore protection, *Flood control, *Landfills, Hurricanes, Coastal engineering, Florida, Wave pile-up, Currents (Water).
Identifiers: Dade County, Florida, Miami Beach.

A beach erosion and hurricane protection study in Dade County, Florida, found that the most practical way to restore adequate recreational and protective beaches and to stabilize the shoreline is to artificially fill the beach and dunes between Government Cut and Baker's Haulover, and build a beach at Haulover Beach Park. The plan of improvement would involve placement of about 14, 800,000 cubic yards of fill. Periodic replenishment is necessary. Estimated first cost is $29,500,000 and annual cost is $488,000. Hurricane frequency, hurricane tide data, flood damage, and costs are tabulated. Maps show plan of improvement, hurricane paths, tides and high water profiles. (Knapp-USGS)

EROSION OF COHESIVE SEDIMENTS,
Bureau of Reclamation, Denver, Colo.
Phillip F. Enger, Ernest T. Smerdon, and Frank D. Masch.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 94, No HY4, pp 1017-1049, July 1968. 33 p, 21 fig, 6 tab, 64 ref, append.

Descriptors: Agriculture, Channels, *Cohesive soils, Design criteria, *Erosion, Field investigations, Hydraulic laboratories, Sedimentation, Hydraulics, Sediment control, *Sediments, Bibliographies, *Soil erosion, Deposition, Soil physical properties, Tractive forces, Boundary shear, Scour, Stable channels.
Identifiers: Sediment load, Sediment deposits, Bank stability, Critical tractive force.

This final report describes laboratory research, field observations, design criteria, and agricultural land and channel problems relating to cohesive sediments. Laboratory research has been directed toward determining relationships between a critical boundary shear stress or a tractive force above which scour of a cohesive material begins, pertinent soil properties, and flow conditions. Erosion or deposition occurring in a natural water channel depends on the local forces exerted by flowing water, geology and properties of the material over which the water flows, and sediment load being transported. Current literature is reviewed and recommendations are made for practical design application and future research. An extensive bibliography, a compilation of design equations and charts, and design information not available in the literature are included. (USBR)

VELOCITY AND SEDIMENT CONCENTRATION DISTRIBUTIONS IN OPEN CHANNEL FLOWS,
South Dakota State Univ., Brookings.
B. E. Eno.
Report to OWRR Project A-007-SDak, June 1968. 7 p.

Descriptors: *Open channel flow, Flow characteristics, Flow profiles, *Velocity, Transition flow, Turbulent flow, Theoretical analysis, Sediment transport, *Sediment distribution, Instrumentation, Continuity equation, Momentum equation, *Channel morphology, Boundary layer, Roughness coefficient.

Turbulent velocity distributions in open channel flows were analytically reviewed and experimentally investigated. The works of Prandtl, Von Karman, and Nikuradse pertaining to turbulent velocity distributions were critically reviewed with a view toward particular application to open channel flows. Physical and mathematical inadequacies of these works were noted and discussed. The experimental phase consisted of velocity distribution measurement in smooth and artificially rough channels. The roughness elements included lateral strips, cubes and hemispheres placed on the flume bed at various spacings in various patterns. An equivalent roughness parameter was devised and calculated for many of the roughness patterns. The experimental results were compared to the work of other authors and discussed. The suspended sediment transport theory was briefly reviewed, emphasizing its dependency upon a valid velocity distribution model.

GENERAL TWO-DIMENSIONAL STOCHASTIC MODEL FOR THE TRANSPORT AND DISPERSION OF BED-MATERIAL SEDIMENT PARTICLES,
U. S. Geological Survey, Colorado State University, Fort Collins, and Kansas State University, Manhattan.
William W. Sayre, and W. Jay Conover.
Proc of the 12th Congr, Int Ass for Hydraul Res, pp 88-95, Sept 1967. 8 p, 2 fig, 6 ref.

Descriptors: *Bed load, *Dispersion, *Sediment transport, *Statistical models, *Stochastic processes, Alluvial channels, Tracking techniques, Marking techniques, Sediments.
Identifiers: *Stochastic models.

The transport of bed-material sediment particles in an alluvial channel is represented as a stochastic process consisting of a sequence of longitudinal and vertical displacements of random magnitude between which there are rest periods of random duration. In order to apply the model, the probability density functions for (1) the step lengths, (2) the rest period durations given the elevation at which a particle is deposited, and (3) the elevation at which a particle is deposited, must be known. It is suggested that these functions be experimentally evaluated by tracing a single radioactive particle to evaluate length of steps and rest periods. (Knapp-USGS)
W69-00683

TOTAL BED-MATERIAL DISCHARGE IN ALLUVIAL CHANNELS,
Geological Survey, Washington, D. C., Water Resources Div., Colorado State University, Fort Collins.
Feng-Ming Chang, Daryl B. Simons, and Everett V. Richardson.
Proc of the 12th Congr, Int Ass for Hydraul Res, pp 132-139, Sept 1967. 8 p, 2 fig, 6 ref.

Descriptors: *Sediment transport, *Bed load, *Suspended load, *Alluvial channels, Flow rates, Particle size.
Identifiers: Prandtl equation, Reynolds equation, Bed-material discharge.

A study of total bed-material discharge in alluvial channels, partially based on existing theories, was conducted. The bedload discharge was obtained by utilizing the energy-work relation of the fluid and the bed material. An equation for velocity distribution was obtained by integrating the Reynolds equations using Prandtl's hypothesis of mixing length. Applying the basic equation for the distribution of suspended load by O'Brien, the suspended bed-material discharge was investigated in terms of bedload discharge. Then, the total bed-material discharge was obtained simply by adding the bedload discharge and the suspended bed-material discharge. The results through checking with available laboratory and field data appeared to be mutually consistent and satisfactory. (Knapp-USGS)
W69-00684

EFFECT OF NON-EQUILIBRIUM FLOW CONDITIONS ON SEDIMENT TRANSPORT AND BED ROUGHNESS IN A LABORATORY ALLUVIAL CHANNEL,
U S Geological Survey, Colorado State University, Fort Collins.
R. E. Rathbun, and H. P. Guy.
Proc of 12th Congr, Int Ass for Hydraul Res, pp 187-193, Sept 1967. 7 p, 2 fig, 4 ref.

Descriptors: *Sediment transport, *Flumes, *Sediment load, *Graded, *Model studies.
Identifiers: Nonequilibrium flume flow conditions.

Non-equilibrium flow conditions were examined in a laboratory alluvial channel to determine responses of the recirculation and sand-feed systems of flume operation to change in load, tailwater depth, and sand-bed slope. It was found that the simple proportionality suggested by Lane (1955) for relating sediment transport rate, sand size, water discharge and slope, predicted qualitatively the results. Experiments were limited to one water discharge and one sand. (Author)

2K. Chemical Processes

CO-OXIDATION OF ORGANIC MOLECULES BY METHANE-OXIDIZING BACTERIA GROWING AT THE EXPENSE OF METHANE,
Illinois Univ, Urbana.
R. E. Kalio.
Water Resour Center Res Rep 11, Univ Ill, July 1967. 5 p, 1 fig, 1 tab. OWRR Project A-016-Ill.

Descriptors: *Bacteria, *Methane, Benzenes, Aromatic compounds, *Oxidation, Enzymes, Methane bacteria, Pseudomonas.

Bacteria which oxidize methane are known to oxidize other substances while they are growing on methane. Tests were conducted on a large number of these bacteria to determine whether they could oxidize benzene-based organic compounds. None of the methane-oxidizing bacteria attacked benzene rings. Bacteria which attack benzene (or aromatic) rings contain an unusual enzyme called benzene hydroxylase which is not found in methane-oxidizing bacteria.

THERMODYNAMIC RELATIONSHIPS WITHIN THE SYSTEM: SEDIMENTS-SEA-AIR,
Massachusetts Univ, Amherst.
Oliver T. Zajicek.
OWRR Project A-012-Mass, Final Rep, Jan 1968. 11 p, 7 fig.

Descriptors: *Iron oxides, *Equilibrium, Chemical reactions, Vapor pressure, *Oxygen, Sea water, Atmosphere, pH, Electrochemistry, Solutions, Solubility, Aqueous solutions, Electrical conductance, Thermodynamics, Thermodynamic behavior.

This project attempts to add to our knowledge of a chemical equilibrium thought to obtain at the hydrosphere-atmosphere interface, namely, the interaction of iron oxides with molecular oxygen, thought possible to be the buffering equilibrium for the oxygen content of the atmosphere. The question arises as to whether the partial pressure of oxygen is still increasing or whether it is fixed at its present value of 0.21-atm. Conductivity and pH measurements have been carried out on solutions of ferric nitrate in chloride-nitrate mixed media. The pH range, electrolyte concentration, and composition of salt media have been varied. Eleven solvent solutions were used in which the ionic mole ratio was varied from 0 to 1. In these solutions the total electrolyte concentration was held constant at 0.5, 1.5, 2.5, and 3.5 mole/1. Because of the termination of the project, results to date are incomplete and positive conclusions cannot be drawn from the data. However, certain anomalous trends were observed in which conductivity increased while pH decreased, suggesting the possibility of a polymeric hydrolyzed iron species in which the adsorbed hydrogen ions are thermodynamically stable yet kinetically liable.

2L. Estuaries

THE NET EFFECT OF WIND ON TIDAL STREAMS IN FLORIDA,
Florida Univ, Gainesville.
David H. Moreau.
Water Resour Res Proj Completion Rep, Oct 1967. 11 p, 1 fig, 5 tab, 5 ref. OWRR Project A-006-Fla.

Descriptors: *Wind tides, *Winds, Wind velocity, Waves, Regression analysis, Estuaries, Florida, Time series analysis, *Tides.

The object of this study was to determine the effect of wind velocities on tide heights in a small Floridian estuary. In particular, the task was to perform a statistical analysis of wind and tide data collected during a one-year period at Cedar Key, Florida. Astronomical tides were extracted from the data using a harmonic function for the nine most significant components from a total of twenty-six as reported by USC and GS. Coefficients were estimated using a least-squares analysis. Astronomical tides accounted for 87% variance in the record. Hourly deviations of observed data from estimated astronomical tides averaged-0.027 feet with a standard deviation of 0.705 feet. Those deviations were then related to components of wind velocity taken perpendicular and parellel to the shore line using linear regression analysis. Averaging of the instantaneous wind velocities at a given hour with those in the preceding hour produced the best correlations, but this combination explained only 25% of the residual variance. Several factors were noted that limited the correlation: (1) data were available at a single station, (2) all data were instantaneous readings, and (3) the analysis was based on all wind observations with no attempt to select only those data corresponding to higher winds.

DYNAMIC AND STATIC STUDIES OF SEA-WATER INTRUSION,
Hawaii Univ., Honolulu.
L. Stephen Lau.
Water Resour Res Center, Univ Hawaii, Tech Rep No 3, Feb 1967. 31 p, 9 fig, 20 ref, 4 append. OWRR Project A-007-Hi.

Descriptors: Saline water intrusion, Hawaii, Ground water, Basalts, Aquifers, Density stratification, Ground water, Saline water-freshwater interfaces.
Identifiers: Ground water discharge, Density diffusion, Ground water dispersion, Ghyben-Herzberg principle.

A theoretical equation was adapted and modified for a water table aquifer to relate fresh water flow to the sea, geometry of the fresh water-sea water interface, and aquifer characteristics under dynamic equilibrium. Verification was obtained in laboratory experiments conducted in a hydraulic sand model. Other laboratory experiments revealed special flow patterns in the transitional zone of the fresh water-sea water interface. The extent and the vertical density gradient of the brackish water in the transitional zone were examined for their effects on modifying the conventional Ghyben-Herzberg ratio. Groundwater data collected from a deep well on Oahu, Hawaii, was discussed as an illustration.

SALT-WATER INTRUSION EFFECT OF A FRESH-WATER CANAL,
Georgia Inst. of Tech., Atlanta, Civil Eng. Sch.
M. R. Carstens, and George D. May.
Water Resour Center, Ga Inst Tech, May 1967. 49 p, 6 fig, 6 tab, 5 ref, 1 append. OWRR Project B-003-Ga.

Descriptors: *Aquifers, *Seepage, Flow, *Groundwater movement, Soil water movement, Canals, *Saline-fresh water interfaces, *Groundwater barriers, *Saline water intrusion, Permeability, Water table, Flood plains, Pore pressure, Land reclamation, Flownets, Silts, Saturated flow, Saturated soils, Subsurface flow, Laplaces equation.
Identifiers: Chauchy-Riemann equation.

The effectiveness of a fresh-water canal to act as a barrier to salt-water intrusion in areas adjacent to salt-water bodies is analyzed and discussed. Results for a condition in which the fresh-water seepage from the land is a small fraction of the fresh-water seepage from the canal are presented. Solutions discussed show that the fresh-water flow from a canal acts as a dam forcing to a lower elevation the interface between the salt-water saturated soil and the fresh-water saturated soil. Laplace's equation in the fresh-water flow domain is solved for the flow condition which involves a water table and a second density interface between the fresh water and salt water. Seepage losses from a fresh-water canal with fine-grained soils were not found to be excessive. Use of a fresh-water canal for reclamation of salt-water intruded deltas for agricultural purposes are discussed.

03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3B. Water Yield Improvement

YIELD OF STREAMS IN MASSACHUSETTS,
Massachusetts Univ, Amherst.
G. R. Higgins.
OWRR Project A-003-Mass, Water Resour Res Center, Univ Massachusetts, Interim Rep, Mar 1967. 175 p, 14 fig, 4 tab, 13 ref, 4 append.

Descriptors: *Water yield, *Storage, *Hydrology, Mass curves, *Streams, Frequency, Flow, Evaporation, Droughts, Drainage basins, Massachusetts.

It is specifically the purpose of this project to provide a practical guide whereby preliminary values of storage required to sustain a desired yield from any drainage basin in the Commonwealth of Massachusetts can be easily predicted. Mass curves, recurrence interval curves, and flow duration curves for nearly all the gaged streams in Massachusetts are presented together with a discussion of the water resource problems of the Commonwealth. Results from the mass curves are expressed in the form of frequency curves which reflect all the streamflow data available through the drought year of 1965. In order to estimate the effect of creation of reservoirs on yield, the current research efforts are concerned with an evaporation study on the Quabbin Reservoir. In subsequent reports it is recommended that these data be incorporated along with a full assessment of the drought. The present report is labeled INTERIM pending the further study and application of computer methods to working up the data.

SMALL WATERSHED STORAGE INCREASE USING LOW DAMS,
Massachusetts Univ, Amherst.
Karl N. Hendrickson.
OWRR Project A-016-Mass, Water Res Center, Interim Rep, Jan 1967. 20 p, 8 ref.

Descriptors: Groundwater, Hydrographs, Infiltration, Rainfall, Runoff, *Water yield improvement, Hydrology, Research and development, *Small watersheds, Retention, Evaptranspiration, Hydrologic budget, Water storage, Benefit-cost ratios, Dams.
Identifiers: Base flow, *Low dams, *Retention dams.

Information generated by experimental watersheds, hydrology investigations, and new statistical methods is so great and sophisticated that only large projects can afford to exploit it properly. Great areas of the country are made up of town and city-owned small watersheds not producing all the water that they could because of underdevelopment of ground water capacity for charging. Lo

dams reduce runoff and provide a longer period for infiltration. This increases duration and amount of base flow. A simple, rational method of appraising, designing, and estimating the value of low dams is presented. The scheme consists of estimating base flow, infiltration capacity, and evaporation from a short summer rainfall by observing the amount and duration of the rain, runoff of the stream and change of the water table. From this data, probable change as the result of construction of a low dam is estimated. Change is related to the domestic price of water and its probable value to the system to determine project economy. A case study is used to illustrate the method.

LEGAL ASPECTS OF WEATHER MODIFICATION-SNOWPACK AUGMENTATION IN WYOMING,
Wyoming Univ, Laramie.
John M. Pierce.
Water Resour Ser No 11, Univ Wyoming, Laramie, June 1968. 59 p, suppl, 236 ref.

Descriptors: Atmospheric precipitation, *Weather modification, *Laws, Weather, Cloud seeding, Riparian rights, Liabilities, Bibliographies, Natural resources, Agreements, Claims, Damages.
Identifiers: Snow pack, Atmospheric research, *Legal aspects, USBR Research Contracts, *Legislation, Wyoming, Ownership, Snowfall.

At the present time the legal aspects of weather modification are undefined. Few cases have been decided and there is no legal consensus of either the control and ownership of clouds and the moisture therein or of the liability of the weather modifier. Twenty two states have enacted legislation regulating weather modification activities; most statutes amount to no more than token regulation. The need for Federal regulation of weather modification has been expressed in the Congress. If states continue to make no more than token regulations, pressure will force the Federal government to take over all facets of weather modification. Most theories advanced for determining ownership of clouds and moisture therein are based on rules and theories used in other areas of natural resources. Little new thinking has developed with consequent little attempt being made to adjust legal thinking in scientific areas. Unless new ideas are presented and adlpted by the legislatures and courts, the legal profession will have failed in its obligation to society. Now is the time for legal institutions to act so that development can take place independent of pressures, and proper recognition can be given to social and economic effects that my result. (USBR)

STORAGE REQUIREMENTS FOR WATER IN THE UNITED STATES,
Resources for the Future, and U S Geological Survey, Washington, D. C.
George O. G. Lof, and Clayton H. Hardison.
Water Resources Res, Vol 2, No 3, pp 323-354, 1966. 32 p, 6 fig, 11 tab, 9 ref.

Descriptors: *Water storage, *Reservoir storage, *Regulated flow, *Dams, *Cost analysis, Routing, Water management (Applied), Evaporation.
Identifiers: Water storage requirements.

Storage requirements for various levels of streamflow regulation in the 22 major regions of the contiguous U S are presented to supersede those given in Committee Print 32 of the Select Committee on National Water Resources, U S Senate. At levels of development, the storage required to provide the desired flow in 95 and 98% of the years is substantially larger than that previously given. Carry-over storage requirements based on probability routing of annual discharge are combined with seasonal storage requirements to give the revised storage requirements, which are then used to compute revised evaporation losses and revised cost estimates by the methods previously used. The maximum net flow that could be made available for the 22 regions for 98% of the years is shown to be 965 billion gal per day (bgd) for which a storage capacity of 3.6 billion acre-ft would be required. A net flow of 922 bgd could be made available with 2 billion acre-ft of storage. Any increment of flow above the 922 bgd figure would have storage costs exceeding 10 cents per thousand gal delivered. (Knapp-USGS)

3E. Conservation in Industry

THE AVAILABILITY OF WATER FOR INDUSTRIAL USES IN SELECTED SMALL COMMUNITIES IN MISSISSIPPI,
Mississippi State Univ., State College.
Guy T. Peden, Jr., and Van N. Oliphant.
Water Resour Res Inst Rep, June 1967. 101 p, 4 fig, 16 tab. OWRR Project A-011-Miss.

Descriptors: Bibliographies, Water, Industries, Rural areas, Water requirements, *Industrial water, Mississippi, *Water supply, Social aspects, Rainfall, Groundwater, Aquifers, Water wells.

This study was undertaken to determine availability of water for industrial uses in selected small communities in Mississippi. Results show that water is available for industrial uses in these communities. Several communities did not have all of the water information requested. Ground water is the source of supply for all communities in the study. Aquifers servicing these communities yield continuing supplies of excellent to good quality water. None of the communities foresees any problem in its future water supply. The majority of the communities have excess capacities which can supply relatively large amounts of water. Increasing demands by industrial, residential, and commercial users may force these communities to expand their facilities. The majority of the industries in the area depend on community facilities for water supply. Several industries and the largest individual users have privately owned industrial wells. Industries in the study area use water in quantities ranging from several hundred gallons per month to over 40 million gallons per month. The majority of the industries in the study area stated that they did not locate at their present location primarily because of available water.

DEVELOPMENT OF METHODS FOR INCREASING THE EFFICIENCY OF WATER USE IN CRANBERRIES,
Massachusetts Univ, Amherst.
John S. Norton.
OWRR Project A-005-Mass, Pap, Symp Water Resour Res, Univ Massachusetts, June 1967. 16 p, 15 fig, 1 tab.

Descriptors: *Cranberries, *Dikes, Irrigation systems, Irrigation efficiency, *Flood irrigation, *Water harvesting, Bogs, Equipment.

Materials were procured for an assortment of temporary dikes for cranberry bogs and 7 dikes were built. Two dikes were vinyl sheeting supported on railings and anchored below ground by 1 by 2 in. wood strips. One dike was aluminum, supported by a wood railing. Three dikes were earth with sheet aluminum cores. Two of the earthen dikes were built over filled-in ditches, the third built on bog surface. The seventh dike was erected on private property but removed prior to testing. Only the sheet vinyl and aluminum dikes were constructed in time for testing in 1966. Considerable difficulty was experienced because of washouts under both the vinyl and aluminum sheeting. Tests will be made on all dikes in 1967 in conjunction with work under Hatch Project No 51. The current trend toward water harvest methods. The equipment consists of an elevator to remove the berries from the water surface, and a blower, ducting, and screen to separate debris from the berries before they are loaded into trucks.

AGRICULTURAL WATER CONSIDERATIONS IN DEVELOPING STATE WATER PLANS,
Texas A and M Univ., College Station.
Fred A. Schmer, and Carroll W. Keese.
Water Resour Inst Rep, 1966. 13 p, 5 fig, 1 tab.

Descriptors: *Agriculture, *Water development, Water costs, Economics, Irrigation, Water requirements, Water users, Crops, Water resources, Texas, Water utilization, Water resources development.
Identifiers: *Water plans.

Agriculture presently accounts for one-third or more of the total water use depending on how we define use. If we define use as making water completely unavailable for other uses, agriculture accounts for a higher portion of the water used. Some estimate that 85% of withdrawal can be at-

LIBRARY U. OF I. URBANA - CHAMPAIGN

tributed to agriculture. Therefore, water for agriculture is of utmost concern in developing a water plan. Agricultural use is defined in this paper as water used for irrigation. In the analysis of agricultural resources related to water development in Texas an attempt was made to present to water planners the effect of unlimited water availability to agriculture and the effect of water being available to agriculture at a relative cost similar to that at the present time. Agriculture in Texas, and most other areas, cannot compete for water simply on the basis of need for agricultural production. Efficiency of this production and effect of irrigation and related industry on the total economy must be analysed if additional water is to be allocated to agriculture in the future.

Identifiers: Ohio River Basin, St. Lawrence River Basin.

Records of chemical analysis, suspended sediment, and temperature are compiled for waters of the Ohio and St. Lawrence River Basins for 1960. The data collected at the 136 stations on 78 streams include chemical analysis reports on silica, Fe, Ca, Mg, Na, K, carbonate, bicarbonate, sulfate, C1, F, nitrate, B, pH, total dissolved solids, specific conductance, discharge, suspended sediment load, and particle size analyses. Al, Mn, color, acidity, oxygen consumed, phenolic material, and minor elements are reported for a few streams. (Knapp-USGS)

MAP INTERPRETATION AND CLASSIFICATION OF BURIED VALLEYS,
Massachusetts Univ, Amherst.
Marvin Saines.
Ground Water, Vol 6, No 4, pp 32-37, July-Aug 1968. 6 p, 5 fig, 13 ref.

Descriptors: *Terrain analysis, *Valleys, *Glacial drift, Water sources, Superimposed drainage, Topography, Maps.
Identifiers: *Map interpretation, *Buried valleys, Deranged drainage.

Types of buried valleys are described and four examples are given of topographic map interpretation as related to water resources studies and the development of groundwater supplies. Buried valleys are the source of about 80% of the water pumped from glaciated areas in Ohio and other states. The two main types are: (Type I) valley completely buried by glacial drift without present streams along their courses, and (Type II) valleys that are partly buried or partly exhumed usually with streams along their courses. If a stream is flowing mainly in a Type II valley, the bottom of which is deeply buried by drift, local areas where the stream is cutting bedrock are postglacial channels of derangement. Postglacial channels of derangement, which often can be recognized on a topographic map, reveal that a buried valley (often Type I) exists nearby. (Knapp-USGS)

FALL WATER SUPPLY SUMMARY FOR NEVADA,
Dept of Agriculture, Soil Conservation Service, Reno, Nevada.
Bob L. Whaley, and Roy E. Malsor, Jr.
Soil Conserv Serv Water Supply Rep, Oct 1, 1968. 5 p, 4 tab.

Descriptors: *Water supply, *Forecasting, Groundwater, Streamflow, Reservoir storage, Snowmelt, Nevada, Soil moisture.

As forecast, extremely low streamflow has been experienced throughout Nevada this past season. In most areas, the streams peaked 2 to 3 weeks earlier than normal, and the flows likewise fell off much earlier than usual. Water users served from reservoirs have had a fairly adequate water supply, due to last year's good reservoir carryover. The heavy reservoir usage to augment the low streamflow left below-average amounts of water in storage in most of the reservoirs throughout the state. Streamflow ranged from a low of 9 to 19% on the Owyhee up to 73% on the Upper Carson River. The Humboldt River flowed less than 50% of average for the season. Above-normal June precipitation on the Humboldt added materially to the runoff this yr. Fall soil moisture surveys indicate that the mountain soils on the east slope of the Sierras are extremely dry. Soils in the Humboldt and Owyhee Basins are near average, however. This dry condition, coupled with the depleted reservoir storage, indicates the need for a normal or above normal snowpack this coming winter season in order to insure an adequate water supply next season. Tables and graphs show streamflow, reservoir storage, and soil moisture as of Oct 1, 1968. (Knapp-USGS)

STATE ROAD AND EBNER COULEES, WISCONSIN.
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 360, 57 p, 1968. 3 plate, 6 tab, 1 attach, 1 append.

Descriptors: *Flood control, *Channel improvement, *Diversion, Wisconsin, Cost-benefit analysis, Diversion structures, Relocation, Community development, Urbanization.
Identifiers: LaCross, Wisconsin, Urban developments.

Floods on State Road and Ebner Coulees, LaCrosse, Wisconsin were studied and control measures are suggested. The floods are caused by high rates of runoff from rugged terrain in upper reaches of the watersheds. Predicted damages are $351,700 in 1970 and $578,000 in 2020 without control. The suggested plan includes channel improvements and diversion works leading from Ebner Coulee to the LaCrosse River. The estimated first cost is $4,495,000 and annual costs a $192,000. The benefit-cost ratio is 1.36. (Knap USGS)

NAVASOTA RIVER WATERSHED, TEXA (BASIN DEVELOPMENT STUDY REPORT).
Army Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 341, 2 p, 1968. 16 fig, 2 plate, 64 tab, 3 append.

Descriptors: *Flood control, *Water suppl *Recreation facilities, *Reservoirs, Texas, Chann improvement, Cost-benefit analysis, Water d mand, Water yield, Hydrogeology, Aquifers, Su face waters.
Identifiers: *Navasota River Basin, Brazos Riv Basin.

A study of the Navasota River watershed, Texa was made and it was decided that the authorize water supply and flood control project for Braz River and Tributaries, Texas, be modified to pr vide for the construction of Millican and Navaso no. 2 Reservoirs with channel improvements flowing easements, instead of the authorized Fe guson River Project. The estimated first cost $119,707,000, the annual cost is $229,000 and t benefit-cost ratio is 2.8. The present water use the Lower Brazos Basin is 340 mgd and is expect to increase to 1,326 mgd in 2025 and 2,088 mgd 2075. Present supplies will be inadequate by 198 requiring development of Navasota River wat supplies. Irrigation and power projects are not i cluded because they would yield less benefit tha costs. Detailed hydrologic, water resources, a economic data are tabulated. (Knapp-USGS)

ALABAMA GREAT SOUTHERN RR CO BROACH (SURFACE RUNOFF - PROOF AN DAMAGES).

119 So 2d 923-925 (Miss 1960).

Descriptors: *Judicial decisions, Mississippi, *Su face runoff, Surface drainage, *Landfills, Bound ries (Property), Rainfall, Damages, Legal aspect Water law.
Identifiers: Damages (Legal aspects).

Plaintiff sought damages from the defendant ra road company, due to the alleged discharge of su face waters on plaintiff's property. Plaintiff alleg that this discharge was due to the railroad's filli of its land and the slight encroachment of this f on plaintiff's land. At trial the railroad admitt such encroachment, which occurred because plai tiff had set his fence back several feet from the pr perty line. However, the railroad did dispute the legation that the fill materially increased the flow surface waters onto plaintiff's land. The trial cou directed a verdict for plaintiff, submitting on t issue of damages to the jury, with a very general i struction. On appeal to the Mississippi Supren Court the case was reversed and remanded. T court held: (1) a verdict may not be directed whe only one of two issues in the case was establish without dispute; and (2) that an instruction damages not furnishing the jury with any guide wi reference to the rules of measurement of damag in surface water cases was in error. (R. F. Willian Fla)

HAMMONS V ILLINOIS CENTRAL R R (SU FACE RUNOFF--FLASH FLOODS).

119 So 2d 846-848 (La 1960).

Descriptors: *Judicial decisions, Louisiana, *Su face runoff, Surface drainage, Ditches, Drains, C verts, *Flash floods, Flood damage, Excessi precipitation, Obstruction to flow.

Plaintiff sued the railroad for property damage caused by flooding allegedly due to the blocking of the natural drainage from plaintiff's land by the railroad's roadbed. Plaintiff also contended that defendant's failure to construct a drain under its roadbed, and its improper construction of a drainage ditch along its right of way contrary to the grade, caused his damage. Defendant denied these allegations and averred that the drainage ditch was built by public authorities and not the railroad. The trial court found that the flood damage was due to a heavy rain and flashflood which was of the type to occur 'once in a decade,' and that the drainage ditch along the roadbed was built in collaboration with public officials, for the town's interests, not those of the railroad. Accordingly, the trial court found for the defendant. On appeal, the Louisiana Supreme Court affirmed the decision. Due to the unusual nature of the rain, plaintiff failed to prove negligence. He also failed to prove his loss was a result of defendant's commission or omission. (R. F. Williams-Fla)
W69-00474

BURSON V SALIBA (SURFACE RUNOFF IN ALABAMA).
116 So 2d 609-610 (Ala 1960).

Descriptors: *Judicial decisions, Alabama, *Repulsion (Legal aspects), *Surface runoff, Surface drainage, Obstruction to flow, Rainfall, Ditches.

Plaintiff Burson, owner of an upper lot in a municipality, sought a mandatory injunction and damages against Saliba, the adjoining lower landowner. Plaintiff sought to require defendant to remove a retaining wall and part of a building which it had built at the property line, and which allegedly blocked the natural flow of surface water from plaintiff's to defendant's land, thereby causing flooding conditions. Defendant's demurrer was sustained and plaintiff appealed. The Alabama Supreme Court held that the demurrer was properly sustained. The defendant breached no duty to plaintiff, and therefore there was no actionable negligence. A lower proprietor in an incorporated town or city can obstruct the flow of surface water from higher ground over his property even though it is the only way such water may pass. The sole reason for this is because the property happens to be in an incorporated area. Also, rainfall in a drainage ditch is not accorded the same rights as a defined, distinct stream. (R. F. Williams-Fla)
W69-00479

MONTGOMERY V DOWNEY (SURFACE DRAINAGE).
162 N E 2d 6-12 (1959); 17 111 2d 451.

Descriptors: Drainage water, Floodwater, *Return flow, Riparian waters, *Surface drainage, *Natural flow doctrine, Surface waters, Downstream, Upstream, Flow, *Levees, *Channels, Retaining walls, Judicial decisions, Illinois, Surface runoff, Prescriptive rights, Water law.
Identifiers: Dominant estate, Servient estate, Easements of drainage.

Suit to compel defendants to remove alleged obstructions to the natural flow of surface waters from adjoining lands of the plaintiff. It is alleged that certain work done by the defendants on a levee prevented sufficient drainage from plaintiff's dominant estate, and caused surface waters to back up and stand on plaintiff's land. The court held that once such an obstruction has been maintained for the prescriptive period, it may be said to have ripened into an easement and the owner of the servient estate then has the right to maintain the levee or obstruction at its original height and make such repairs as may be required to maintain it. However, in the absence of further expansion of the easement by prescription, the right to maintain does not permit raising the levee so as to cause damage to the land of the plaintiff. Plaintiffs failed to sustain the burden of proving injury to their land greater than that which the land had for many years sustained in times of flooding. The court thus found that the maintenance done by the defendants was within the permissive category. Judgment was rendered in form of the defendant. (Kuder-Fla)

JOHNSON V GOODVIEW (SURFACE DRAINAGE).

167 N E 2d 132-139 (Ohio Com Pl 1960).

Descriptors: Construction, Controlled drainage, Landscaping, *Drainage effects, Rainfall disposition, Return flow, *Surface drainage, *Surface runoff, Excess water, Rural areas, Cities, Reasonable use, Judicial decisions, Flow, Water law, Repulsion (Legal aspects), Ohio, Natural flow.
Identifiers: Civil law rule, Servient estate, Trespass.

Action by owner of lower city property against owner of higher city property for damages caused by the flow of surface water from higher to lower land. The court distinguished the urban from the rural law governing this situation. Under the urban rule, the owner of lower land is not bound to accept natural surface water flowing from adjoining higher land. There is no liability upon the lower owner if he raises the grade of his property in a reasonable manner, even though in so doing he obstructs the natural flow of surface water to back up and stand upon the higher land. Under the rural rule, however, the lower owner is bound to accept natural surface waters flowing from upper land with no liability on the part of the upper owner. The court points out, however, that there are several exceptions to this latter rule. Employing the urban rule, the court held that the defendant in constructing apartment houses and parking lots upon the higher land, and thereby increasing and diverting the flow of surface water upon the lower adjoining property, were liable for damages caused to the lower land. (Kuder-Fla)

KAZANAKY V BERGMAN (SURFACE RUNOFF).

17 Misc 2d 1015; 192 NYS 2d 302-304 (1959).

Descriptors: *Judicial decisions, New York, *Surface runoff, Surface waters, Surface drainage, Water injury, *Dams, Outlets, Pipes.
Identifiers: Evidence.

Plaintiff brought an action for injunctive relief and damages against defendant, who owned a contiguous tract of land with a higher elevation than that of plaintiff. Defendant had constructed a horseshow shaped dam which captured surface and perfolating waters from his land. Two pipes discharged any overflow which might occur, and these waters eventually found their way onto plaintiff's land. The dam did not leak nor did any water spill over the top. Plaintiff alleged that this was a diversion of surface water onto his land, causing a wet and marshy condition. The trial judge stated that in New York there is no discrimination between upper and lower proprietors, neither be dominant or servient to the other. Owners may improve their property, with only the limitation that they do so in good faith, and abstain from draining surface water onto their neighbor's property by pipes or ditches. Plaintiff failed to established a causal connection between the condition of his land and the pipes in defendant's dam. It appeared that such conditions resulted only from natural causes. Judgment was for defendant. (R. F. Williams-Fla)

DISCOVERY, DEVELOPMENT, AND MARKING OF WATER HOLES, ETC, BY GOVERNMENT.

43 USCA Secs 361-363.

Descriptors: *Arid lands, *Water holes, Locating, Sites, *Legislation, Public lands, Federal government, Fouling, *Water resources development, Appliances, Maps, Springs, Streams, Public benefits.
Identifiers: *Secretary of the Interior, Marking of water holes, Monuments, Signboards, Defacing of signposts, Crimes.

Section 361 empowers the Secretary of the Interior to: (1) discover, develop, and render more accessible for public benefit, springs, streams, and water holes on arid public lands of the United States; (2) erect and maintain signposts and monuments at intervals along the accustomed lines of travel, containing information and directions as to the location and nature of such water holes; (3) provide convenient means and appliances by which water may be brought to the earth's surface at the water holes; (4) prepare and distribute maps, reports, and general information relating to the water holes and their specific locations. Section 362 makes it a crime to willfully or maliciously injure, destroy, deface, or remove any of the signposts or monuments, or to willfully or maliciously fill up, render foul, or in any way destroy or impair the utility of the water holes. Section 363 authorizes the Secretary to make such regulations as may be necessary to effectuate the purposes of the act. (Smodish-Fla)

IN-SITU DETERMINATION OF AQUIFER PARAMETERS FOR USE IN THE DRAINAGE FUNCTIONS,
Utah State Univ, Logan.
S. Abdollah Jenab, Dean F. Peterson, and A. Alvin Bishop.
Pap 68-203, Amer Soc Agr Eng 1968 Annu Meet, Logan, Utah, June 1968. 37 p, 12 fig, 14 tab, 6 ref.

Descriptors: *Ground water, *Groundwater flow, *Drainage, Mathematical analysis, Aquifers, Drainage systems, Hydraulic conductivity, Discharge coefficients, Thickness, Water table, Field tests, Seepage, Porosity, Specific yield.
Identifiers: In situ tests, Glover equation, Drainage yield, Drain spacing.

Important aquifer characteristics in drainage design are hydraulic conductivity, aquifer thickness, and specific yield. Hydraulic conductivity measured in the laboratory is not reliable for field use, aquifer thickness is very hard to measure, and specific yield is an elusive variable. Most authors assume specific yield to be constant; others contend that it changes with depth to water table. Experience shows that water table height calculated from laboratory data does not agree with observed values in the field. Field measurements of aquifer characteristics are desirable to predict true fluctuations of ground water. Two field methods (constant discharge and constant head) were evaluated for measuring in situ aquifer parameters. Parameters are determined with transient functions and may be used in drainage and drainage discharge functions for designing drainage systems. Examples are given for the design. (USBR)

MISSISSIPPI RIVER FROM CASSVILLE, WISCONSIN, TO MILE 300.
U S Army Corps of Engineers, Washington, D C.

U S 90th Congr, 2d Sess, House Doc No 348, 128 p, 1968. 7 plate, 13 tab, 1 attach, 1 append.

Descriptors: *Flood control, *Iowa, *Illinois, *Mississippi River, Levees, Drainage systems, Cost-benefit analysis.

Data on flooding in the upper Mississippi River Basin are reviewed and plans for flood protection of Clinton and Bettendorf, Iowa, and Fulton, East Moline, and Milan, Illinois, are presented. Flood protection plans for the 5 cities were found to be economically justifiable. The improvements recommended would consist of levees, floodwalls, interior drainage facilities, and remedial work on railroads, utilities, and other structures. Flood control cost is $9,200,000 with a 2.8 to 1 benefit-cost ratio in Clinton, Iowa, $4,470,000 and 1.1 to 1 in Fulton, Illinois, $2,150,000 and 2.1 to 1 in Bettendorf, Iowa, $4,270,000 and 1.4 to 1 in East Moline, Illinois, and $1,210,000 and 1.9 to 1 in Milan, Illinois. PRELIMINARY ESTIMATES OF LOW-FLOW FREQUENCY INTERRELATIONS FOR UPSTATE NEW YORK STREAMS,
U S Geological Survey, Albany, New York, Water Resources Division.
Robert M. Beall.
U S Geol Surv Prof Pap 600-C, pp C196-C198, 1968. 3 p, 1 fig, 3 ref.

Descriptors: *Low flow, *Frequency analysis, Statistical methods, Hydrographs, Discharge (Water), Base flow, New York, Flow characteristics.
Identifiers: *Low-flow frequency, Upstate New York streams.

Reasonably accurate values of mean annual discharge and of the annual low flow having a recurrence interval of 2 years usually can be obtained from short-term secondary or partial-record station data by correlation with long-term station data. At 125 sites in or near upstate New York where more than 20 years of daily discharge data have been collected, these flow characteristics have been related to annual low flows with recurrence intervals of 10, 20, and 50 years. The relation is shown as a family of curves from which long-term return period discharge may be estimated within accuracy limits of about 1% of the mean annual flow. (Knapp-USGS)

4B. Groundwater Management

GEOCHEMICAL INVESTIGATION OF THE GROUNDWATER SYSTEM IN THE LANSING, MICHIGAN AREA,
Michigan State Univ, East Lansing, Dept Agricultural Eng.
Samuel B. Romberger.
Water Resour Res Terminal Rep, Apr-June 1967. 19 p, 2 fig, 3 tab. OWRR Project B-007-Mich.

Descriptors: Geochemistry, *Groundwater, Michigan, Acidity, *Analysis, Soil chemistry, Mineralogy, Solubility.
Identifiers: Aquifer geochemistry.

The factors controlling the chemistry of ground water are presently being studied in the upper Grand River drainage basin in central Michigan. Representative subsurface water samples have been collected and analysed for sodium, potassium, calcium, magnesium, iron, chloride, and sulfate. The chemical nature of the water changes with respect to pH, and the concentration of bicarbonate and iron, as it is brought to the surface from the depth of sampling. Therefore, it is necessary to measure these immediately after sampling in the field in order to obtain values representative of the water at depth. Values for these three quantities obtained in sampling and analysis. Analytical procedures for use in the field and in the laboratory have been developed so that a large number of samples can be collected and analysed rapidly with good accuracy and precision. Standard titration methods are used for bicarbonate and chloride; colorimeter methods for iron in the field and for sulfate; spectrometric methods for sodium, potassium, calcium, magnesium, and iron in the laboratory; and the pH is measured using a standard field pH meter. The results will be compared with the chemistry of the aquifer material, and with the composition of soils and surface materials to determine the relationship between them.

REGIONAL GEOLOGY AND GROUNDWATER HYDROLOGY OF THE SAHIL AREA, TUNISIA,
U S Geological Survey.
L. C. Dutcher, and H. E. Thomas.
U S Geol Surv Water-Supply Pap 1757-G, pp G1 G53, 1968. 53 p, 3 fig, 4 plate, 25 ref.

Descriptors: *Geology, *Water resources, *Hydrogeology, *Groundwater, *Arid lands, Water wells, Hydrologic data, Aquifers, Water quality, Logging (Recording), Groundwater basins, Water sources.
Identifiers: Tunisia, Sahil Susah, Tunisia.

The regional geologic and hydrologic features of the Sahil Susah area, in central Tunisia are discussed. The area has poor water resources which may be inadequate for the existing population of 447,000. The region is arid, and most of the small amount of precipitation falls on the mountains. Runoff and evaporation are high so that very little water is recharged to the ground, and dissolved solids are high. Saline lakes and salt-filled depressions are common. The rocks of the area are complexly folded and faulted, dividing it into a large number of groundwater basins. Shallow wells yield water everywhere in the area, but much of it is too saline to use. Fine sand impairs performance of many of the wells drilled for the study. Water in deeper formations is fresh only in the parts of the area where height and relief have permitted flushing. Water in deeper rocks under the low steppe and coastal area is saline. Maps show geology, well locations, piezometric contours, areas of artesian flow, and extent of aquifers. (Knapp-USGS)

GROUND-WATER RESOURCES OF THE AC VALLEY, RIO GRANDE DO NORTE, BRAZIL,
U S Geological Survey.
Harry G. Rodis, and Jonas Maria de Castro Araujo

U S Geol Surv Water-Supply Pap 1663-C, pp C1-C34, 1968. 34 p, 2 fig, 1 plate, 4 tab, 14 ref.

Descriptors: *Groundwater movement, *Natural recharge, *Water quality, Evapotranspiration, Recirculated water, Aquifers.
Identifiers: *Acu Valley, *Rio Grande do Norte, *Brazil.

To determine the availability of groundwater in and around the Acu Valley, Brazil, inter-governmental research was conducted. Estimated natural recharge alone is probably 2 1/2 to 5 times as the water pumped from wells in 1964 and may be increased by water introduced from upstream by the river, or by water moving underground from other adjacent aquifers. Recirculation of water infiltrating the water table will gradually cause an increase in dissolved solids in the water. Ground water quality is generally good; dissolved minerals will not affect irrigation in the Valley for some time and quality is not likely to deteriorate because of the relatively rapid circulation and renewal of water in the aquifer. Evapotranspiration will also tend to increase dissolved substances in water, and salts in soil. Water from alluvium is generally potable and can be used for municipal water supplies and other purposes. Wells in the alluvium yield up to 30,000 l/hr. Considerable water is available from the Acu Sandstone and the Jandaira Limestone deposits, but it is highly mineralized and is not of acceptable quality for human consumption at some spots. DESIGN AND CONSTRUCTION OF A DUAL RECHARGE SYSTEM AT MINOT, NORTH DAKOTA,
U S Geological Survey, Bismarck, North Dakota.
Wayne A. Pettyjohn.
Ground Water, Vol 6, No 4, pp 4-8, July-Aug 1968. 5 p, 2 fig, 1 tab, 1 ref.

Descriptors: *Recharge, *Pit recharge, *Recharge wells, Surface-groundwater relationships, Cost-benefit analysis, Cost comparisons, Water conveyance.
Identifiers: *Dual recharge, Perforated pit recharge.

A groundwater recharge facility was constructed in 1965 and placed in operation to forestall an impending water shortage at Minot, North Dakota. The facility is unique in that the rate of recharge to a buried sand and gravel aquifer is augmented by perforating an overlying bed of clay using hydraulic connectors (gravel-filled bored holes) in conjunction with an open-pit excavation. The connectors were drilled by typical well-boring techniques and the open pit was excavated by common construction methods. The recharge technique made it possible to add about 4.5 million gallons per day of water to underground storage with a total capital investment of about $200,000. The alternative originally proposed was a 50-mile long pipeline to Garrison Reservoir, at a 1959 estimated cost of $12,000,000. The recharge technique employed at Minot should have wide application in the groundwater industry in areas where natural recharge to permeable deposits is impeded by overlying beds of low permeability. PHYSICAL AND ECONOMICAL ASPECTS OF CONJUNCTIVE USE OF IRRIGATION WATER IN SMITH VALLEY, LYON COUNTY, NEVADA,
Nevada Univ., Reno, Desert Res. Inst.
P. A. Domenico, D. F. Schulke, and G. B. Maxey.

Hydrol Water Resour Publ 1, Tech Rep Series 2, July 1966. 47 p, 19 fig, 4 tab, 13 ref. OWRR Proj B-007-Nev.

Descriptors: Groundwater, *Conjunctive use, *Optimum development plans, *Supplemental irrigation, *Water management (Applied), Water costs, Consolidation, Surface-groundwater relationships, Optimization, Water utilization, Pumped storage, Water allocation (Policy), Water resources development, Surface waters, Water distribution (Applied).

Supplemental irrigation wells in Smith Valley are individually owned and operated and can be used in conjunction with surface water to irrigate about 6300 acres of land whereas an additional 8700 acres have surface water rights only. Ground water is now used only to the extent of deficiencies in surface water supplies and as a late season requirement during years of normal or above-normal flow, or about 2 out of every 5 yr based on historical deficiencies. Most conjunctive appropriators are now virtually assured of a full supply of irrigation water every season regardless of flow of West Walker River. On the basis of historic flow and well yield and assuming centralized or district operation of the well fields for the benefit of the entire valley, existing pumping facilities could provide about 93% assurance of a full supply of irrigation water for all appropriators in Smith Valley. Further, analysis based on returns from ranching and cost of supplemental pumping for various levels of demand, efficiency, and lift, indicates that more water could be pumped cheaper with existing wells if the operation were centralized instead of under individual control. One suggestion is that the operating water district purchase and operate wells as 'sole owner,' thus providing water for benefit of the entire area.

Identifiers: San Joaquin Valley, Calif, Long Island, N Y, Israel.

Water resources development and comprehensive management are discussed with particular emphasis on ground-water reservoirs and artificial recharge to achieve optimum benefit from available water resources. Aquifers must be managed so that storage will be reduced during peak consumption and replenished by recharge during periods of surplus surface water. Artificial recharge practices can (1) capture and store excess water, (2) alleviate flooding, (3) improve water quality, (4) store cooling water or heat for industrial processes, and (5) build barriers to reduce salt-water encroachment. Advantages of ground-water reservoirs over conventional types are reduced costs, larger capacities, no evapotranspiration losses, and use of large aquifers as distribution systems. A review is given of advances, problems, and the scope of artificial recharge and related operations in Israel, Southern Calif, and the High Plains of Tex. Insight into the magnitude and value of some of these aquifer systems can be gained from consideration of the San Joaquin Valley, Calif. A discussion of ground-water recharge on Long Island, N Y, provides knowledge of artificial recharge in urban and suburban coastal areas. (USBR)

4C. Effects on Water OF Man's Non-Water Activities

EROSION FROM SUBURBAN HIGHWAY CONSTRUCTION,
U S Geological Survey.
Raymond B. Vice, George E. Ferguson, and Harold P. Guy.
ASCE Proc, J Hydraul Div, Vol 94, No Hyl, Pap 5742, pp 345-348, Jan 1968. 4 p, 1 tab.

Descriptors: *Erosion, *Accelerated erosion, *Road construction, *Sediment yield.
Identifiers: Erosion effects of roadwork.

The extent of erosion and transportation of earth materials exposed in highway work was studied in a 4.54 sq mi drainage basin in Fairfax County, Virginia, in 1961 and 1964. About 11% of the basin was disturbed. Sediment yield was measured by sampling at gaging stations for 88 storm events representing the overland runoff from 1961-64. The mean concentration of sediment in the flow increased as the flow in a storm increased. Sediment concentrations in midsummer flow were about double these of midwinter flow. Variability of concentration and yield was considerable, depending on exposure and remedial measures. About 179 acres of construction contributed 94% of the 37,000 tons transported from the basin during the 3.4 years of record. About 85% of the total sand eroded and 29% of the silt were redeposited in the basin and did not pass the sampling site. Precipitation was 13% below average; there would have been about 22% more erosion, or 139 tons per acre per year, with average precipitation. That is ten times normal cultivated-land erosion and five hundred times that of pasture or forest. (Knapp-USGS)
W69-00423

GARDNER V RICHMOND COUNTY (INNUNDATION OF PRIVATE LANDS).

101 Ga App 261 113 S E 2d 411-412 (Ct App 1960).

Descriptors: *Floods, Georgia, *Compensation, Legal aspects, State government, Legislation.

The action was to recover damages to the plaintiff's property caused by flooding and ponding of water on his property due to certain acts of the Highway Department in improving a road. The trial court sustained demurrers to the petition because it was served on the Highway Department rather than the county. The court held that the plaintiff had a right under the constitutional provision requiring adequate compensation for property taken or damaged for a public purpose and that Ga Code no. 95-1710 provides a method for bringing suit against the state. The plaintiff's petition was correct and the demurrer should have been denied. (Horner-Fla)

LIBRARY U. OF I. URBANA - CHAMPAIGN

KELLER V STATE (LIABILITY FOR FLOODING).
19 Misc 2d 794; 194 NYS 2d 358-366 (1959).

Descriptors: New York, Damages, Civil law, Community development, Eminent domain, Judicial decisions, Natural flow doctrine, Right-of-way, State governments, Water law, *Flood damage, *Negligent inundation, Overflow, Flooding, Culverts, *Embankments, Roadbanks, Highway drainage.

The defendant constructed a fourteen-foot embankment along its highway right-of-way that of necessity cut across the natural drainage of many lands, and caused flooding thereon. To remedy this situation, defendant then installed a culvert. The culvert did not alleviate the problem because it was installed in a negligent manner. The court held that recovery could be had by a landowner for damage resulting from public improvements effected under legislative authority if the damage is shown to be a proximate result of defendant's negligence; (This liability may be extended where the chain of causation extends to land not contiguous to property directly taken for aforesaid public improvement.) The claimant was held to have proven the defendant's negligence and was awarded damages for flooding of his land, as was an owner of land that was not contiguous to the property actually taken for the public improvement. 4D. Watershed Protection

WATERSHED PROTECTION AND FLOOD PREVENTION.
16 USCA Secs 1001-1008 (1964).

Descriptors: *Water conservation, *Watershed management, *Flood control, *Water resources development, Water resources, Projects, Water utilization, Water policy, Cost sharing, Benefits, Federal government, State governments, Local governments, Legislation, Cost-benefit analysis, Water districts, Drainages, Multiple-purpose projects.

The act sets up a program whereby federal assistance may be rendered to any state, political subdivision of a state, or any district with authority to maintain and separate flood prevention or conservation projects. The purpose of the assistance is to cooperate with local governments in preventing erosion, flood water and sediment damages in the watersheds of the rivers and streams of the United States; and in furthering the conservation, development, utilization, and disposal of water and thereby preserving and protecting the nation's land and water resources. The Secretary of Agriculture is authorized to assist local organizations in preparing and carrying out plans for flood prevention or the conservation, development, utilization and disposal of water in watershed or subwatershed areas. The local organizations must supply the land for the project and pay its proportionate share as determined by the Secretary. However, the Secretary is impowered to make federal loans to finance the local costs. (Horner-Fla)

WATER POLICY ON RANGE AND FOREST LANDS,
Karl S. Landstrom.
J Farm Econ, Vol 34, No 5, pp 747-750, Dec 1952. 4 p.

Descriptors: *Watershed management, *River basin development, *Water conservation, Erosion control, Forest management, Sediment yield, Surface runoff, Watersheds (Basins), Forestry, River basins, Runoff, Mountains, Federal government, Water resources, River basin commissions, Sediment control, Missouri, Wildlife, Recreation.

An essential function of range and forest land is to safeguard watersheds and their water supplies. The president's Water Resources Policy Commission recommended a 9 point policy. Soil and forest conservation should occupy a major place in river basin programs. Federal farm and water resources policies should support conservation. The work of watershed management agencies should be coordinated into a single program for each basin and for the country. Techniques are required to measure accomplishments and to estimate the size of the task. Watersheds should be protected by curtailing improper uses of watershed lands. Federal mining laws need revision to provide development of nonmineral resources on mining claims. Expenditure for watershed management should increase in line with expended water developments, and conservation practices on private land should be enforced. There should be public acquisition of areas not suited to private conservation. Participation of operators and the public should increase in watershed management. (Rives-Fla)

ISOTOPIC ANALYSIS OF URANIUM IN NATURAL WATERS BY ALPHA SPECTROMETRY,
U S Geological Survey, Water Resources Division.
Kenneth W. Edwards.
U S Geol Surv Water-Supply Pap 1696-F, pp F1-F26, 1968. 26 p, 6 fig, 8 tab, 24 ref.

Descriptors: *Analytical techniques, *Uranium radioisotopes, *Radiochemical analysis, Ion exchange, Radioactivity, Spectrometers.
Identifiers: *Alpha spectrometry.

A method is described for the determination of U-234/U-238 activity ratios for uranium present in natural waters. The uranium is coprecipitated from solution with aluminum phosphate, extracted into ethyl acetate, further purified by ion exchange, and finally electroplated on a titanium disc for counting. The individual isotopes are determined by measurement of the alpha-particle energy spectrum using a high resolution low-background alpha spectrometer. Overall chemical recovery of about 90% and a counting efficiency of 25% allow analyses of water samples containing as little as 0.10 microgram/l of uranium. The accuracy of the method is limited, on most samples, primarily by counting statistics. (Knapp-USGS)
W69-00425

LINDANE ADSORPTION BY LAKE SEDIMENTS,
Wisconsin Univ., Madison.
Erik G. Lotse, Gordon Chesters Graetz, and Gerhard B. Lee.
Water Resources Center Rpt, July 25, 1967. 42 p, 10 fig, 10 tab, 5 ref. OWRR Project B-008-Wis.

Descriptors: Adsorption, Pesticide kinetics, *Insecticides, Bottom sediments, Lake soils, Radiochemical analysis, Organic matter, Bonding, Clay minerals, Particle size.
Identifiers: Chlorinated hydrocarbons, Multiple regression, Lindane.

Lindane (gamma isomer of benzene hexochloride) adsorption was determined on eight intact lake sediments using a radiochemical technique. Lindane adsorption was shown to be affected by sediment suspension concentration, organic matter content, lindane concentration, clay content and lindane-sediment ratio and to obey Freundlich's equation. As the lindane molecule is neutral and not subject to ionization, van der Waals forces and hydrogen bonding were considered the most feasible adsorption mechanisms. The chlorine atoms of lindane are the most likely bonding sites to hydroxyl groups residing on the surfaces of the organic and mineral components of the sediments.

FACTORS INFLUENCING THE CONDENSATION OF 4-AMINOANTIPYRINE WITH DERIVATIVES OF HYDROXYBENZENE-II. INFLUENCE OF HYDRONIUM ION CONCENTRATION ON ABSORPTIVITY,
Rutgers Univ., New Brunswick, N. J.
Samuel D. Faust, and Edward W. Midulewicz.
Water Res, 1, 509-522, 1967. 29 p, 3 fig, 10 tab, 11 ref. OWRR Project A-012-NJ.

Descriptors: *Phenols, *Organic compounds, Industrial wastes, Water pollution, *Water pollution effects, Water pollution sources, Water quality, Chemical analysis, Chemical properties, Chemical reactions, *Analytical techniques, Data collections.
Identifiers: Halogenated phenols.

The oxidative coupling of 4-aminoantipyrine with several phenolic compounds has been examined with pH values of 8.0 and 10.0. The pH value influences this attack in two ways: (a) greater reactivity is observed at pH 8.0 as the phenol exhibits greater dissociation to a phenoxide ion, and (b) lesser reactivity is observed at pH 10.0 that is ascribed to a reduction of the electrophilic characteristics of the 4-AAP. This hypothesis was tested through a program to systematically sample 17 sites in 5 river systems of northeastern New Jersey and to examine these samples for phenol. In 84 of 153 split samples a reaction pH of 8.0 yielded higher phenol contents than the reaction pH of 10.0. In addition, 44 of these 84 samples were cases where negligible phenol contents were reported at the reaction pH of 10.0. The significance lies in the greater detectability (i.e., analytical sensitivity) of 4-AAP toward phenolic compounds at pH 8.0 than at pH 10.0. (Author)

FACTORS INFLUENCING THE CONDENSATION OF 4-AMINOANTIPYRINE WITH DERIVATIVES OF HYDROXYBENZENE--PART I--A CRITIQUE,
Rutgers Univ. Water Resources Research Inst.
Samuel D. Faust, and Edward W. Mikulewicz.
Rutgers State Univ Rept, 1967. 30 p, 4 fig, 12 tab, 16 ref. OWRR Project A-012-NJ.

Descriptors: Water supplies, Water analysis, pH, Phenology, Phenols, Waste water, Oxidation, Chemical analysis, Chemical reactions, Water quality.

Quantitative determination of phenols in water and waste water is attempted by condensation with 4-aminoantipyrine and oxidation under alkaline conditions to a colored product. Major chemical factors that influence this reaction are pH value between 8.0 and 11.0, the type of aqueous buffer, and the type of substituted phenol. These 3 factors influence the analytical and molecular sensitivities as well as the wave length of maximum absorbance. A total phenol determination is not possible with the 4-aminoantipyrine technique as currently practiced.

5B. Sources of Pollution

ANALYSIS OF WATER QUALITY OF THE MAHONING RIVER IN OHIO,
U S Geological Survey.
Gene A. Bednar, Charles R. Collier, and William P. Cross.
U S Geol Surv Water-Supply Pap 1859-C, pp C1-C32, 1968. 32 p, 21 fig, 1 plate, 5 tab, 3 ref.

Descriptors: *Water quality, *Thermal pollution, *Dissolved oxygen, *Dissolved solids, Waste water disposal, Chlorides, Streamflow, Ohio.
Identifiers: *Mahoning River, Iron concentration, Sulfate load.

Certain water-quality characteristics of the Mahoning River, Ohio, were investigated in order to establish water-quality criteria based on hydrologic conditions and water use. Water temperatures at Princetown and Leavittsburg, which ranged from the freezing point to 78 deg F during 1963-1965, were not affected by thermal loading; however, downstream from Leavittsburg, industrial cooling caused critical thermal loading during periods of low streamflow; 104-108 deg F at Lowellville and Struthers. The dissolved-oxygen content was frequently depleted by oxygen-consuming materials and warmed water from industrial and municipal wastes discharged into the river's lower reaches. At Lowellville, the river water had a dissolved-oxygen content of 5 ppm or less for 67% of the time, and 3 ppm or less for 16% of the time; at Leavittsburg and Princetown this was at acceptable levels. The dissolved-solids concentration was 150-450 ppm at Leavittsburg, and 200-650 ppm at Lowellville, where industrial use caused the higher value. Chloride content (42--108 ppm) was acceptable. Sulfate load from waste disposal and acid mine drainage ranged from 28 to 2,420 tons/day, at different times, depending on location. Iron concentrations were frequently over 20 ppm between Leavittsburg and Lowellville. (Llaverias-USGS)

WATER QUALITY CONTROL AND MANAGEMENT, SNAKE RIVER BASIN.
Federal Water Pollution Control Administration.

Fed Water Pollut Contr Admin Report, 72 p, Sept 1968. 12 fig, 33 photo, 12 tab.

Descriptors: *Water quality control, *River basin development, *Pacific Northwest U S, Water Quality Act, Water pollution sources, Water pollution control, Flow control, Waste treatment, Radioactive wastes.
Identifiers: Snake River Basin.

Summarization is made of various studies which have provided the impetus to Federal-State Water pollution control planning in the Snake Basin. Water quality is now impaired for municipal supply, recreation, fish production, and aesthetic enjoyment in many places; pollution problem areas are indicated on a map. Increase in pollution is occurring because of larger waste discharges and because of a complex system of improvements for irrigation and power, which cause low flows, increased temperature, and decreased capacity to assimilate wastes. Fish kills, thermal pollution, bacterial contamination, and aquatic growth are problems which make portions of the river aesthetically offensive. Groundwater in the upper basin is a largely undeveloped resource which must be protected and used to supplement surface water. The low-level radioactive wastes of the National Reactor Testing Station, which overlies the recharge basin of the Snake River aquifer, must be properly managed to protect both groundwater and the river. Specific measures to reduce contamination are listed. Water resource development data, waste sources, treatment, quality criteria, and other topics are presented in tables and graphs. (Knapp-USGS)

AN EVALUATION OF THE USE OF ESCHERICHIA COLI SEROTYPES AS A MEANS OF TRACING MICROBIAL POLLUTION OF WATER,
Pennsylvania State Univ., University Park.
Paul J. Glantz, and Thomas M. Jacks.
Inst Res Land and Water Resour Rept 1967. 57 p, 8 fig, 11 tab, 25 ref, 2 append, disc. OWRR Project A-008-Pa.

Descriptors: *Water pollution, *Pollution abatement, Sewage, Sewage treatment, *Tracers, Bacteria, *E. Coli, Coliforms, Microorganisms, Sewage bacteria, Effluents.

Utilization of E. coli serotypes as a means of tracing microbial pollution in water was studied. Objectives of the study were: (1) to evaluate the significance of the survival of coliform bacteria and Escherichia coli serotypes in effluent; (2) to determine influence of effluent on the occurrence of coliform bacteria in birds in the spray area; and (3) use of coliform density for determining microbiologic purity of waste water. Results showed that in chlorinated effluent, members of the Klebsiella-Aerobacter group outnumbered E. coli by a ratio of 9:1. Sewage effluent irrigation had no influence on the occurence of coliform bacteria in wild birds and percolation of effluent through soil to a depth of 2-4 ft was sufficient for reclamation of renovated effluent. There was a general rise in fecal coliforms through May to July, declining in August and September. The E. coli serogroups isolated at the different sampling points were an indication of their probable upstream source. Results of this study indicate that tracing microbial pollution by serologically identifying the E. coli strains is feasible.
W69-00625

CHEMICAL REACTOR THEORY APPLIED TO MODELING THE DYNAMICS OF A CONTROL SYSTEM FOR WATER QUALITY OF A RIVER: PHASE 1-A FEASIBILITY STUDY,
Maine Univ., Orono.
Edward G. Bobalek.
Univ Maine Rept., July 1967. 39 p, 8 fig, 5 tab, 2 append, 33 ref. OWRR Project B-001-Me.

Descriptors: Feasibility studies, *Simulation, River systems, Maine, *River regulation, *Water quality, *Estuaries, Water pollution, Saline water-freshwater interfaces, Mixing, Tidal waters, Dispersion, Computer models, *Mathematical models, Fresh water.
Identifiers: Penobscot Estuary, Maine.

The objective of this study was to provide an exploratory appraisal of the feasibility of conducting an extensive experimental probing of a selected river system. Such experiments would have the ultimate goal of providing an accurate and workable model of 1 typical system in the State of Maine. Such a model would be used to implement an overall control scheme which can provide a basis for engineering decisions on regulating waste discharges into the river under conditions which do not overload the capability of the river to purge itself and restore water qualities affected by pollution loading. The Penobscot River estuary was selected as representative of conditions existing in the state with respect to water pollution. The key problem requires prediction of the velocity profile in response to intermixing of tidal and fresh waters. Appraisal of such intermixing correlations is of special importance in determining residence times for pollutants which are nullified by available oxidation and dilution mechanisms. The determination of mixing effects is projected as a primary goal of Phase II which continues this study through acquisition and analysis of data which can permit more precise development of the models here proposed as a starting foundation for the experimental plan.

THE EFFECTS OF TEMPERATURE AND DENSITY GRADIENTS UPON THE MOVEMENT OF CONTAMINANTS IN SATURATED AQUIFERS,
Alabama Univ., University.
Harold R. Henry.
Univ Alabama Rpt, 1967. 14 p, 4 fig, 26 ref. OWRR Project B-004-Ala.

Descriptors: *Contamination, *Aquifers, Convection, *Dispersion, Waste disposal, Thermal properties, Model tests, Saturation zones, Seepage, Numerical method, Laboratory tests, Permeability, Porosity, Porous materials, Bibliographies, Darcys law.
Identifiers: Temperature profiles, Thermal diffusion.

Experimental and analytical studies were made on a simplified geometric model. A horizontal, lateral temperature gradient was imposed upon a horizontal channel of square cross section containing sand saturated with water. Velocities were measured by

LIBRARY U. OF I. URBANA - CHAMPAIGN

tracing dye patterns along the glass walls and top of the channel. Temperatures were measured by networks of copper-constantan thermocouple junctions spaced throughout the channel. Experimental temperatures and velocities indicated the presence of a convection current which increased in strength as the temperature gradient increased. By defining a stream function psi and by appropriate normalization of the variables, the governing equations were reduced to an expression which is parameter free except for a value, M, which is a modification of the Rayleigh number. Finite difference solutions are obtained for several values of M and for several boundary conditions. The effective value of thermal diffusivity is found to be about 50 times larger than the usual value because of the dispersion which occurs when fluid moves through the tortuous channels within the porous bed.
W69-00651

TRAVEL OF ABS AND AMMONIA NITROGEN WITH PERCOLATING WATER THROUGH SATURATED OAHU SOILS,
Hawaii Univ., Honolulu.
Reginald H. F. Young, L. Stephen Lau, and Nathan C. Burbank.
Water Resour Res Center, Techn Rep 1, Jan 1967. 54 p, 13 fig, 7 tab, 32 ref, 4 append. OWRR Project A-001-Hi.

Descriptors: Percolating water, Infiltration, Detergents, Pollutants, Nitrogen compounds, Soil contamination, Cesspools, Sewage disposal, Groundwater movement, Absorption, Adsorption.

A laboratory study was undertaken to determine the ability of 4 Oahu soils, Lolekaa, Lahaina, Manana, and Wahiawa, to remove ammonia, ABS, and coliforms from water percolating continuously through saturated soils. Soils utilized were chosen on the basis of their wide occurrence on the island areas where percolating water may enter directly and in quantity into the ground water body that principally provides the island's domestic water supply. All 4 soils had a high clay content and low pH. Laboratory tests were conducted with 10-ml burettes and subject to continuous saturated flow. Each contaminant was applied in solution 1 at a time to a fresh soil sample. Tap water was used for ABS and ammonia nitrogen while sewage was used to study coliform removal. The results of coliform removal from percolating liquids were not conclusive because of small soil samples and loading procedures. Preliminary tests verified some general principles developed elsewhere for effective coliform removal by ground disposal of sewage. The final clarifier effluent from a trickling filter was passed continuously through a 30 in. column of Wahiawa soil and an initial coliform reduction of about 90 % was effected.
W69-00652

A SIMPLIFIED PHYSICAL MODEL FOR STUDYING ASSIMILATIVE CAPACITY,
Georgia Inst. of Tech., Atlanta, and Michigan Univ., Ann Arbor.
W. E. Gates, K. H. Mancy, and F. R. Shafie.
Pap, 21st Ind Waste Conf, Purdue Univ, May 1966. 42 p, 17 fig, 27 ref. OWRR Project A-003-Ga.

Descriptors: *Dissolved oxygen, *Water, Water quality, *Oxygen sag, Models, Water analysis, *Oxygenation, Oxygen.

This is a report on the use of a physical model in an attempt to define and evaluate the assimilative capacity of natural waters. Most of these endeavors have utilized dissolved oxygen depletion and/or replenishment as the indicating parameter. Consequently, when dealing with streams, it is generally accepted that the assimilative capacity refers to the oxygen which is available to the biosphere, from or through the hydrosphere, within selected constraints. Because dissolved oxygen content of the hydrosphere is a renewable resource, assimilative capacity is primarily controlled by the rates, the relative rates, and the changes in the rates which dictate the oxygen transfer from the atmosphere to the hydrosphere (surface reoxygenation) and from the hydrosphere to the biosphere (deoxygenation). The physical model described does not permit evaluation of deoxygenation and reoxygenation processes when they are proceeding under identical conditions. The results can be considered only in general terms with respect to other systems, but should be considered as indicative of probable inadequacies in present techniques of assimilative capacity evaluation.
W69-00673

HYDROLOGIC STUDY OF A WASTE-DISPOSAL PROBLEM IN A KARST AREA AT SPRINGFIELD, MISSOURI,
U S Geological Survey, Rolla, Missouri, Water Resources Division.
E. J. Harvey, and John Skelton.
U S Geol Surv Prof Pap 600-C, pp C217-C220, 1968. 4 p, 3 fig, 2 tab.

Descriptors: *Water pollution, *Path of pollutants, *Subsurface drainage, *Karst, Municipal wastes, Sewage effluents, Sinks, Dye release.
Identifiers: *Waste-disposal problem, Seepage runs, Springfield, Missouri.

In a study of a pollution problem in the Springfield area, dye tests, seismic studies, and discharge measurements have proved the existence of a complex naturally developed underground drainage system. Effluent from a sewage plant with secondary treatment travels underground, where it cannot be aerated, and reappears in a downstream spring. Efforts to restrict the effluent to the stream into which it is originally discharged have been only partly successful. Measurements of streamflow and spring discharge show that the natural inflow of water to the spring is large and that it helps to dilute the sewage effluent to a more acceptable level. The primary area of groundwater recharge is agricultural land west of Springfield. Preservation of this area in its present land use and the carrying out of simple corrective measures on the creek carrying the effluent would help alleviate the pollution problem. (Author)

5C. Effects of Pollution

THE EFFECTS OF CLIMATE UPON THE WORK CAPACITY AND CARDIAC AND OPERCULAR CYCLES IN FRESH-WATER FISH,
Massachusetts Univ, Amherst.
John L. Roberts.
OWRR Project A-013-Mass, Proj Completion Rep, Jan 1968. 2 p.

Descriptors: Aquatic animals, *Bioassay, Bullheads, *Climates, Flow, Aquatic environment, *Fish, *Water quality, Physiological ecology, *Thermal stress, Sunfishes, *Swimming, *Temperature, Trout, Ecology, Thermal pollution.

This project investigates sublethal responses by fish to environmental changes that might serve as indexes of water quality. Primarily the study was to describe effects of sustained swimming on heart and ventilation rates of 3 species. The fish chosen were the pumpkinseed sunfish (Lepomis gibbosus); the bullhead, (Ictalurus nebulosus); and the trout (Salmo trutta). Cardioacceleration and increases in ventilation rates were found to occur with enforced swimming in all species. In trout, gill ventilation frequency, but not cardiac frequency, was found to relate in a direct proportionality to swimming speed. Flow velocity of water past the head does not significantly alter the resting pattern of ventilation as does swimming. The secondary aim has been to test selected indexes (cardiac and opercular frequencies). Rapid warming was selected as the index and preliminary testing and recording of these events was tried with goldfish, (Carassiums auratus). The results were unsatisfactory but subsequent experiments at Bristol, England, have shown these 2 rate activities to be highly sensitive indexes of sublethal thermal stress.

WATER TEMPERATURE CRITERIA TO PROTECT AQUATIC LIFE,
Maryland Univ, Natural Resources Institute, Solomons.
J. A. Mihursky, and V. S. Kennedy.
Natur Resour Inst, Contrib 317, Reprint, Amer Fisheries Soc Publ 4, pp 20-32, 1967. 13 p, 11 fig, 43 ref. OWRR Project A-002-Md.

Descriptors: Animal metabolism, Animal behavior, Aquatic animals, *Aquatic life, Estuaries, Fish, Mortality, *Temperature, Temperature control, Thermal pollution, Regulation, Water pollution, Water quality, Water pollution sources, *Aquatic environment.

The ecological significance of temperature in the aquatic habitat is discussed in relation to the thermal loading of ecosystems by electric power plants. It is pointed out that nuclear plants will produce greater amounts of waste heat per kilowatt of electricity than the conventional fossil fuel plants. Effects of temperature on behavior, metabolism, and mortality of aquatic organisms are described to indicate the difficult problems involved in determining acceptable standards for a healthy fish population. A multivariate analysis of interactions between temperature and other environmental factors is suggested. Standards for temperature regulation are described for three ecosystems: (1) cold-water salmonid streams, (2) warm-water centrarchid environments, and (3) estuaries.
W69-00418

ROLE OF NEMATODES AND RELATED MEIOFAUNA AFFECTING FRESH WATER QUALITY IN RHODE ISLAND,
Rhode Island Univ, Kingston.
G. J. Stressel.
OWRR Proj No B-003-RI, Completion Rep, July 1968. 9 p, 2 tab.

Descriptors: *Aquatic microbiology, *Nematodes, *Indicators, *Water pollution, Rhode Island, Water pollution effects, Water Resources Research Act.
Identifiers: *Meiofauna.

Sediment cores, overlying water samples, and samples of the meiofauna of Hunt River, Rhode Island, were taken at seven stations above and below sources of pollution to determine the relationships between fauna and pollution. Physicochemical measurements were made concurrently with sampling. Maximum nematode populations occurred in winter and spring when water temperature was about 8 deg C. Predaceous nematodes were more numerous when organic matter was over 12%. Dissolved oxygen, phosphate, and carbon dioxide concentrations and nematode or meiofaunal populations could not be correlated. Population dynamics at polluted and unpolluted sites were similar, but the predaceous nematode genus Monochus occurred only at polluted sites; it is a promising pollution indicator. (Knapp-USGS)

Proj Rep 1, Univ Mo, Mar 1966. 33 p, 8 fig, 9 tab, ref. OWRR Proj A-004-Mo.

Descriptors: Water quality, *Water pollution, Turbidity, Heated water, Mine acids, Fly ash, Plankton, Aquatic life, Alkalinity, pH, Animals, *Fishkill, Acidity, Hydrogen ion concentration, *Thermal pollution, Industrial wastes.

An investigation was made to evaluate the influence of several effluents on water quality, the biota, and the autotrophic aspects of community metabolism. Certain physical and chemical conditions vary throughout the reservoir in a pattern related to the site of hot water discharge. The most conspicuous environmental variant is water temperature, which ranges from 37 deg C at the steam plant discharge canal to 21 deg C at the western end of the lake. Dissolved oxygen range was 0.2 to 11.0 ppm, with the lower values from the deeper more stagnant water at the eastern and western ends of the lake. No evidence was found of alkaline drainage into the reservoir. At the time of reported fish kills, 1962-63, fly ash was piled adjacent to the reservoir. Fly ash is now stored in bins protected from the weather. Preliminary inspection of the plankton and bottom fauna suggests that the fauna is not rich.

PLANKTON HETEROTROPHY IN A NORTH CAROLINA ESTUARY,
North Carolina Univ., Raleigh, Water Resour. Res. Inst.
John E. Hobbie.
Proj Completion Rep, Univ N Car, Nov 1966. 9 p, 2 fig, 1 tab, 9 ref. OWRR Proj A-015-NC.

Descriptors: *Plankton, Indicators, *Eutrophication, Domestic wastes, Phosphates, *Effluents, *Bacteria, Radioactivity techniques, *Estuarine environment.

The heterotrophic ability of the bacteria of the plankton was studied utilizing uptake of radioactive organic compounds. The method was developed in fresh water, but proved to be adaptable to estuarine conditions. This project, the first phase of a larger study of bacteria in the aquatic ecosystem, found that glucose and acetate were taken up by bacterial uptake systems and that the uptake rate could be analyzed by the equations of enzyme kinetics. The maximum uptake velocity was a good indication of relative heterotrophic activity, and reached a peak during the summer in the Pamlico River estuary. This parameter was a rapid and sensitive indicator of eutrophication as peaks of activity found in a 30-km survey were correlated with domestic wastes and effluent from phosphate mining activity.

WATER QUALITY MANAGEMENT AND THE TIME PROFILE OF BENEFITS AND COSTS,
Water Resources Engineers, Walnut Creek, Calif; Washington Univ, Seattle.
Denny S. Parker, and James A. Crutchfield.
Water Resour Res, Vol 4, No 2, pp 233-246, Apr 1968. 14 p, 9 fig, 2 tab, 6 ref.

Descriptors: Project feasibility, Project planning, *Water pollution, Water development, Water quality, Water requirements, Water management, Water resources, Water utilization, Waste disposal, Pollution abatement, Economics, *Benefit-cost ratios, Public works, Time, Costs, Benefits, *Social values.
Identifiers: Waste water (Pollution), Waste management, *Cost-benefit analysis, Water resources development, Long-term planning.

Economic evaluation of pollution-causing water projects cannot neglect social costs of water pollution, i.e., the net loss of benefits from an alternative use if the water was not used for waste disposal. Planners have often been concerned only with conveying wastes out of their jurisdiction, choosing the most expedient solution. The resulting long-term social costs are often sufficiently large that a different system would have been selected if social costs had been considered initially. The valuation of benefits and costs from major public projects requires long-term forecasts. Long-term social costs cannot be neglected nor ignored when there are demands for amenity services of water. If social costs of water pollution were adequately evaluated, a higher level of investment might be justified for waste management. The obligation to future generations may have a sound economic basis for maintaining higher levels of water quality than can be justified by current benefit-cost practices. (USBR)

BIOCHEMICAL CAPABILITIES OF SURFACE FILMING BENTHIC BACTERIA IN FRESH WATER SYSTEMS,
Missouri Univ., Kansas City.
Russell G. Barnekow, Jr., and Edward L. Davis.
Water Resour Res Center Rept 2, Jan 1967. 24 p, 6 plates, 1 tab, 15 ref. OWRR Project A-005-Mo.

Descriptors: *Bacteria, *Aerobic bacteria, Pseudomonas, Oil wastes, Mycobacterium, *Oxidation lagoons, Biodegradation, Industrial wastes, Waste treatment, Organic matter, Sulfur bacteria, Tertiary treatment, *Cultures.

Utilization of glucose and sorbitol by large, heterogeneous bacterial populations obtained from a petro-chemical oxidation lagoon was examined. Two population types were observed: one which used glucose and sorbitol with no lag period and another which exhibited an extended lag period before substrate utilization was detected. Simultaneous utilization of glucose and sorbitol by populations which did not exhibit a lag period was observed. The extended lag period shown in other populations was attributed to preferential use of endogenous materials. These populations also demonstrated adaptation to exogenous substrates. The populations examined were primarily composed on non-fastidious, oxidative aerobes.

BIOTIC RESPONSE TO POLLUTION REDUCTION IN A RIVER,
Michigan State Univ., East Lansing.
Allen W. Knight, and George H. Lauff.
W K Kellogg Biology Sta Rep, 1967. 56 p, 10 fig, 16 tab, 14 ref. OWRR Project A-010-Mich.

Descriptors: *Stream pollution, *Pollution abatement, Rivers, Water pollution control, Sludge worms, Sludge, Aquatic life, Lake Michigan, Dissolved oxygen.

A study of the Kalamazoo River was conducted to ascertain conditions existing prior to initiation of a pollution abatement program. The river was found to be grossly polluted in a 20-mi stretch below the city of Kalamazoo. Decomposition of organic matter in water and in extensive silt accumulations frequently depleted the dissolved oxygen for 20 mi or more. Sewage fungus covered the surface of sludge deposits and stationary objects in the water while extensive numbers of sludge worms frequently occurred as red fringe along the river margins. Only a few of the more tolerant macroinvertebrates and fish occurred in the very polluted zone. In lower reaches of the river considerable self-purification was accomplished and a return of many of the macroinvertebrates and game fish was noted. The river prior to its discharge into Lake Michigan has accomplished considerable self-purification but carried a large load of suspended and dissolved materials into Lake Michigan.

SURVEY OF THE NATURE AND MAGNITUDE OF THE WATER RESEARCH NEEDS OF THE TEXTILE INDUSTRY OF GEORGIA,
Georgia Institute of Technology, Atlanta.
William L. Hyden, Douglas F. Becknell, and Telford E. Elders.
OWRR Project A-010-Ga. Water Resour Center Rept, June 1966. 27 p, 1 photo, 1 map, 2 append.

Descriptors: *Textiles, *Industries, Industrial wastes, Waste water disposal, *Water pollution control, pH, Effluents, Water chemistry, Waste water treatment, Water reuse, Georgia, Water temperature, Water pollution sources, *Water pollution.
Identifiers: Water use, *Textile industry.

The investigation described herein, consisted of a field survey of 48 representative wet-processing textile mills in the state of Georgia to determine the kinds and frequency of occurrence of serious problems related to water use and waste disposal. From data obtained from plant inspections and interviews, 12 different problems were found to occur at 3 or more of the 48 mills. Excessive hardness of the raw water supply was experienced at 17 mills. Miscellaneous problems of wastewater disposal were found at 11 mills. Analysis of survey results, supported by consultation with industry leaders and experts in sanitary engineering and water chemistry, led to the conclusion that some of the most common problems were subject to solution by known techniques. Others, that occurred less frequently, are problems with no known technically or economically feasible solution. Outstanding is the problem of excessive color in wastewater effluent. A brief discussion includes the 12 most frequently encountered problems. Possible solutions and recommendations regarding research are suggested, among these development of more efficient processing equipment and management techniques.

Descriptors: *Foods, Laboratory tests, Field tests, Water, Biology, Research and development, Water, Temperature, Seasons, Zoology, *Sea nettles, Preditation, Spawning.
Identifiers: *Polyps, *Nudibranch, Medusa.

A number of laboratory and field oriented experiments and observations are described. Temperature tolerance of polyps of the sea nettle showed that they encyst at 4 C. Most polyps set on the undersides of substrates. Predation upon polyps by the nudibranch Coryphella pellucida is revealed. Observations on the winter jelly fish showed that this species is seasonally opposite to the summer nettle and has all the same stages. Growth of medusae, variation in seasonal abundance and setting patterns of planula larvae were examined. Maximum growth observed was from 3 to 170 mm in 33 days. Peaks of abundance and spawning take place in late July and early August. A laboratory experiment showed that the ctenophore is an acceptable and nutritious food for sea nettles.

5D. Waste Treatment Processes

OPTIMAL AERATION SYSTEMS,
Kansas State University, Manhattan.
L. E. Erickson.
Kansas Water Resour Res Inst, Proj Completion Rep, Kansas State Univ, Aug 1967. 41 p, 14 fig, 3 tab, 22 ref, 2 append. OWRR Project B-001-Kann.

Descriptors: Biological treatment, *Activated sludge, *Aeration, Mixing, Hydraulic models, *Mathematical models, *Optimization, Analysis design.

The pattern of flow into the system, the recycle flow, and the mixing within the system are important parts of the hydraulic regime of activated sludge systems. Optimization procedures are used to determine the optimum hydraulic regime for several activated sludge systems. Mathematical models of several step aeration systems are developed and a discrete version of the maximum principle is used to optimize the hydraulic regime in these step aeration systems. The results of this research indicate that the constant K sub 1, which is the dimensionless organic nutrient concentration at which the observed specific growth rate is one-half the maximum value, is an important parameter in selecting the optimal hydraulic regime. This research illustrates some of the uses of mathematical modeling and optimization in the analysis and design of biological waste treatment systems.

OPERATING CHARACTERISTICS OF TWO AEROBIC-ANAEROBIC DAIRY MANURE TREATMENT SYSTEMS,
New Holland Machine Co, New Holland, Pa and Massachusetts Univ, Amherst.
N. W. Webster, and J. T. Clayton.
OWRR Project A-009-Mass, Mange Farm Animal Wastes, Amer Soc Agr Eng, St. Joseph, Mich, pp 61-65, 1966. 5 p, 14 fig, 2 tab, 20 ref.

Descriptors: Waste disposal, *Waste treatment, *Farm wastes, *Cattle, *Aerobic bacteria, *Anaerobic bacteria, Operations, Settling basins, Dairy industry, Biochemical oxygen demand.

Two aerobic waste-treatment systems were designed and tested for use in treating dairy manure. The systems were combinations of aeration and settlement for the purpose of reducing the pollution capabilities of the waste and to make possible the use of treated effluent for transporting fresh waste. The designed systems were first tested on a bench-scale system, and results showed that the loadings were too heavy. The loadings were reduced to 0.044 lb of volatile solids per system and rerun. The second test was satisfactory and loadings and containers were scaled up 100 times to 4.4 lb of volatile solids per system with tank sizes of 1000, 750, 500, and 300 gal. This pilot model was run for 5 months before it was terminated. System A, the anaerobic primary settlement and secondary aeration system was functioning and could have been continued. System B, primary aeration with secondary settlement, did not operate satisfactorily for the full 5-month test period. The system suited for agricultural uses was System A, with the addition of a small sediment tank with provisions for returning the settled solids to the primary settlement tank. This added feature would prevent an anaerobic condition from developing in the final sedimentation tank.

EFFECT OF NITRIFICATION OF ORGANIC WASTES ON WATERS IN THE NATURAL ENVIRONMENT,
Maine Univ, Orono.
K. Keshavan.
Water Resour Center Proj Completion Rep, June 1967. 56 p, 37 fig, 7 tab, 18 ref. OWRR Project A-003-Me.

Descriptors: Nitrification, Chemical reactions, Nitrates, Nitrites, Biochemical oxygen demand, Dissolved oxygen, Water purification, Water quality.

It is currently recognized that the biochemical oxygen demand of streams, estuaries and lakes can not always be reliably determined from data obtained in the laboratory. This is because nitrification is suppressed in these laboratory tests. Nitrification and oxidation of carbonaceous organic compounds occurring concurrently in natural bodies of water will utilize more oxygen than predicted by the oxygen sag curve. As a result, such practices as the classification of streams may be based upon erroneous BOD information. This research has shown that nitrification (oxidation of ammonia by nitrifying bacteria) becomes very significant in the presence of an active flora of nitrifying bacteria. It is more pronounced if the waste contains nitrogenous materials such as proteins and similar compounds. These compounds can be expected in wastes from starch plants, meatpacking plants and many other industries. The research has also shown that if the stream or lake is on the alkaline side (pH greater than 7.5), a further increase in the activity of the nitrifying bacteria can be expected. It is therefore, very important to consider the natural conditions of the receiving body of water before an evaluation of the oxygen resource is made.

THE EFFECT OF ELEVATED TEMPERATURES ON THE TREATMENT OF NORMAL DOMESTIC SEWAGE,
Mississippi State Univ., State College, Water Resour Res Inst.
Lewis R. Brown, Robert G. Tischer, and Cornell M. Ladner.
Miss State Univ, June 1967. 55 p, 26 fig, 6 tab, 5 ref. OWRR Proj A-007-Miss.

Descriptors: Sewage, Waste treatment, Microbiology, *Microorganisms, *Sewage treatment, Domestic wastes, Temperature, Biochemical oxygen demand, Chemical oxygen demand, *Coliforms.

Studies were conducted at temperatures of 30, 45, 55, and 65 deg C. Suspended solids (90%) removals were the same at all temperatures employed while the settleable solids were reduced 80% in the 30 deg C treatment and 58% in the 55 deg C treatment. BOD reductions (70%) were the same at all temperatures tested while the COD removals decreased with increases in temperature. E. coli, an unidentified enterococcus, and the enteric pathogens Salmonella paratyphi and Shigella sonnei were destroyed 30 minutes at 55 deg C and 10 minutes at 65 deg C. The bacteriophage for E.coli 11033-B was considerably more heat stable but was inactivated at 55 deg C by 80.3, 97.9, and 99.9% in sewage, distilled water, and nutrient broth, respectively. There were 1000 facultative thermophiles per ml in the sewage employed. The population growing at temperature of aeration reached 100 million organisms per ml for the 30, 45, and 55 deg C treatment and 10 million organisms per ml for the 65 deg treatment. Thermophiles isolated from normal domestic sewage after aeration at 55 deg C were either Pseudomonas aeruginosa (achromogenic strain) or members of the genus Bacillus. Protozoa were extremely effective in reducing the turbidity and COD of the 55 deg treatment effluent.

HIGH-RATE ROTARY VACUUM FILTRATION,
Rutgers Univ., New Brunswick, Water Resour. Res. Inst.
F. W. Dittman.
Rutgers Univ., 1967. 4 p, 1 tab, 3 ref. OWRR Proj A-004-NJ.

Descriptors: Filtration, *Sludge, Filters, *Sludge treatment, Sewage treatment, Sludge disposal, Waste disposal, Calcium carbonate, *Waste treatment.
Identifiers: Filtration rate, Sludge cake.

An economic study of an existing waste treatment plant indicated that sludge filtration might be an acceptable alternative to the existing process of transportation and ocean dumping, if higher than usual filtration rates could be obtained. Study of the several problems of the variation in filtration rate of aqueous calcium carbonate, suspensions gave numerical values for increase in filtration rate which would result from operating a rotary filter at high speed with a very thin cake. Various means of applying energy to the membrane for rapid continuous separation of thin filter cake are discussed.

RECOVERY OF WARP SIZES,
North Carolina Univ., Chapel Hill, Water Resour. Res. Inst.
Harley Y. Jennings.
Univ N Car, Proj Completion Rep, June 1966. 2 p. OWRR Proj A-016-NC.

Descriptors: *Water pollution control, *Water pollution sources, *Water reuse, *Industrial wastes, Liquid wastes.
Identifiers: *Textile industry.

One phase of study included a search of the literature and preparation of annotated bibliography covering 297 papers on textile wastes. The second phase included an exploratory investigation of the recovery and reuse of textile size materials. Carboxymethylcellulose (CMC) was dissolved from cotton warp with minimal amounts of water and the resulting solution used as the basis for further sizing formulation. Experiments disclosed that one-third of applied CMC could be removed from the sized warp obtaining a 2 percent solution. New formulations prepared from this solution gave satisfactory performance. Warps passed through boiling water to remove waxes and pectins containing 70 percent moisture picked up sufficient CMC from formulation to perform satisfactorily on testing equipment.

ENZYMES AND CATALYSTS FOR PURIFICATION OF INDUSTRIAL WASTE WATER,
Oklahoma State Univ., Stillwater.
James W. Fulton.
Water Resour Inst, Oklahoma State Univ, June 1966. 37 p, 70 ref, append. OWRR Project A-007-Okla.

Descriptors: *Organic compounds, *Water purification, *Enzymes, Phenols, Chemical reactions, Chemical wastes, Industrial wastes, Catalysts.

The purpose of this study is to initiate research in the use of catalyst and enzyme systems for industrial waste-water purification. Records have been assembled on the known undesirable waste-water impurities. The literature has been searched for enzyme and bacteria systems which are known to decompose toxic materials. The decomposition of phenolic compounds has been emphasized, as an example. Suggestions for further research have been given.
W69-00619

THE EFFECT OF ELEVATED TEMPERATURES ON THE MICROFLORA OF NORMAL DOMESTIC SEWAGE,
Mississippi State Univ., State College.
Lewis R. Brown, Robert G. Tischer, and Cornell M. Ladner.
Water Resour Res Inst Rept, July 1966. 20 p, 3 tab, 3 ref. OWRR Project A-007-Miss.

Descriptors: *Microorganisms, *Sewage treatment, *Domestic wastes, Sewage, Temperature, Biochemical oxygen demand, Coliforms, Aeration, Chemical oxygen demand, Waste treatment.

Treatment of normal domestic sewage at elevated temperatures destroyed the enterococcal and coliform populations nearly completely at 65 deg C and is only slightly less effective at 55 deg C. The enteric pathogens, Salmonella paratyphi and Shigella sonnei, are destroyed within minutes at these elevated temperatures. The effluent from a high-temperature sewage stabilization process will not need chlorination. Approximately 100,000 facultative thermophiles/ml appear capable of growing at 55 deg C in the normal domestic sewage employed in these studies, sine thermophilic count at 55 deg C remained about 100 thousand ml when treatment temperature was 30 deg C and the mesophilic count at 30 C remained 100 thousand/ml microorganisms (or dropped off to about 100 thousand) when the treatment temperature was 55 deg C. More organisms appear in normal domestic sewage that grow at 45 deg C than there are that grow at 55 deg C or 65 deg C. The 65 deg C temperature appears to be more detrimental to the mesophilic population than the other temperatures employed. The reductions in COD and suspended solids of the influent sewage averaged more than 90% in all cases.
W69-00634

INCREASED GAS TRANSFER IN BIOLOGICAL REACTORS OF INTEREST IN WASTE WATER RECLAMATION,
Delaware Univ., Newark.
Iraj Zandi, and Miriam S. Shane.
Univ. Delaware Rept., June 1967. 24 p, 13 fig. OWRR Project A-001-Del.

Descriptors: *Activated sludge, *Biodegredation, Sludge treatment, Sludge digestion, Chemical reactions, Sewage treatment, Microorganisms, E. coli, Aerobic bacteria, Polymers, Gases, Oxygen, *Diffusion, Aqueous solutions, *Diffusion, *Growth rates, Respiration, Cultures.
Identifiers: Aerobacter aerogenes, Bacillus megaterium.

Unit processes in waste water treatment are dependent upon the satisfactory transfer of gases into and out of waste water for biological degradation of the organic matter. Any material that could increase transfer efficiency of gases would be of interest in waste water processes particularly activated sludge treatment. Studies of the diffusion of molecules of low molecular weight (such as gases) through dilute polymer solutions seemed to indicate that the rate of diffusivity was greater in aqueous polymeric solution than in pure solvent (water). The effect of a long chain synthetic polymer was studied in relationship to growth and respiration rates using three test organisms. Growth was measured quantitatively in the presence of different concentrations of polymer and compared to growth in the absence of polymer. A closed system using an electronic dissolved oxygen analyzer capable of measuring oxygen in parts-per-billion was used to study respiration rates in the presence of polymer.

ELECTRODIALYSIS IN ADVANCED WASTE TREATMENT,
U S Department of the Interior, Federal Water Pollution Control Administration.
J. Douglas Smith, and John L. Eisenmann.
Water Pollut Contr Res Ser Pub No WP-20-AWTR-18, 219 p, Feb 1967. 32 fig, 28 tab, 19 ref, 5 append.

Descriptors: *Tertiary treatment, *Electrodialysis, *Laboratory tests, Liquid wastes, Water reuse, Membrane processes, Solvent extractions, Scaling, Cost analysis.
Identifiers: *Advanced waste treatment, Carbon adsorption, Secondary effluent, Deionization.

A bench-scale experimental study was made to determine the practicality of partially demineralizing municipal wastewater by electrodialysis. Using filtration alone and filtration followed by carbon adsorption as pretreatments, long-term runs were made with a municipal secondary effluent to determine scaling and fouling effects of the water upon the electrodialysis membranes. During these runs a study was made to determine how high a ratio of product rate to concentrate rate could be obtained without forming scale on the membranes. Some fouling of anion membranes occurred with filtration and carbon adsorption pretreatment; without carbon adsorption, fouling was much worse. Scale formation was not a problem at product to concentrate ratios less than ten. At times much higher ratios were obtained without difficulty. The results of these runs indicated that the total operating cost for a 10-mgd electrodialysis treatment plant might be less than 10 cents per 1,000 gal. (Knapp-USGS)

5F. Water Treatment and Quality Alteration

FACTORS AFFECTING THE REMOVAL OF IRON AND MANGANESE FROM GROUND WATER,
Mississippi State Univ., State College, Water Resour Res Inst.
L. R. Robinson, Jr., E. D. Breland, and R. A. Dixon.
Miss State Univ, 1967. 78 p, 5 fig, 23 tab, 22 ref, append. OWRR Proj A-003-Miss.

Descriptors: *Iron, Manganese, Groundwater, Separation techniques, *Water treatment, Waste treatment, Filtration, Alkalinity, Chemical analysis, Mississippi, Alabama, pH.

By using both a pilot treatment plant and a jar test apparatus, studies were made of factors affecting oxidation and precipitation of iron and manganese from ground waters in Mississippi and Alabama. Aeration alone was insufficient to oxidize and remove iron from waters with alkalinities of less than 50 mg/1 as calcium carbonate. Aeration was also insufficient to oxidize and precipitate manganese from ground waters with pH values of less than 9.0. Additional testing indicated that iron could be successfully removed by the processes of aeration, reaction time, and filtration, if the alkalinity was raised to at least 100 mg/1 as calcium carbonate prior to aeration by adding soda ash, lime, or caustic soda. Manganese could also be removed by raising the pH to 9.0 or preferably to 9.5 with lime or caustic soda. Potassium permanganate also successfully oxidized, precipitated, and removed iron and manganese. It presented the additional advantage that it did not greatly affect the water stability and thus necessitate further treatment. It also proved to be the most economical method from a chemical standpoint.

RADIOACTIVE DECONTAMINATION BY SLURRYING WITH YAZOO AND ZILPHA CLAYS,
Mississippi State Univ., State College.
William A. Goldsmith, and E. J. Middlebrooks.
Reprint, J Amer Water Works Ass, Vol 58, No 8, pp 1052-1062, Aug 1966. 11 p, 8 fig, 2 tab, 18 ref. OWRR Proj. A-004-Miss.

Descriptors: Water supply, Radioactivity, Water treatment, *Slurries, Water pollution treatment, Ion exchange, pH, Adsorption, Clays, *Radioactive wastes, Nuclear wastes, *Radioactive waste disposal, Radioisotopes.

The report covers decontamination of radionuclide-polluted waters using clay slurries. The literature on radioisotope removal is briefly reviewed. The paper discusses effect of pH and ion adsorption by clays. Test results are given on removal of Cobolt 60, Strontium 90, and Cesium 137 using Yazoo and Zilpha clays. Zilpha clay was superior to Yazoo as an adsorber of Strontium 90. Both Yazoo and Zilpha clays provided very good removal of Cesium 137, approximately 90% at a dosage of only 250/mg/1. Decontamination factors and percentage removals obtained for clay dosages used, except for Yazoo clay for Strontium 90, exceeded values obtained from comparable experiments involving other clays reported in literature. These encouraging results indicate that Yazoo and Zilpha clays may prove to be economically more feasible than the clays now used commercially.

THE ACCEPTABILITY OF MINERAL TASTE IN DOMESTIC WATER,
California Univ., Berkeley, Public Health Sch.
Andie L. Knutson, and William H. Bruvold.
Water Resour Res Center, Univ Calif, Rep W107-1A-67, July 1967. 10 p, 2 fig, 1 tab, 12 ref. OWRR Project A-005-Cal.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Standards, Water quality, *Mineral water, Domestic water, *Potable water, *Taste, Attitudes, Dissolved solids, Consumptive use.

This report describes research designed to recommend limiting standards for common mineral content in domestic water in order to assure potability for daily drinking. A near linear relationship was found to exist between mean consumer attitude taste scale scores and a measure of total dissolved solids for 17 selected California water systems. The line so determined had a negative slope, the higher the total dissolved solids the less favorable the mean attitude scale scores. Use of the information provided by this relationship to recommend the desired standards upon full completion of the project was discussed.

5G. Water Quality Control

THE DISTRIBUTION AND PERSISTENCE OF DIAZINON APPLIED TO PLANT AND SOIL AND ITS INFLUENCE ON RHIZOSPHERE AND SOIL MICROFLORA,
Institute of Agricultural and Industrial Microbiology, Amherst and the Cranberry Experiment Station, East Wareham, Mass.
H. B. Gunner, B. M. Zuckerman, and R. W. Walker.
OWRR Project A-010-Mass, Plant and Soil, Vol 25, No 2, pp 249-264, 1966. 16 p, 5 fig, 4 tab, 10 ref.

Descriptors: *Diazinon, Insecticides, Pesticides, Planta, Rhizosphere, Soil microbiology, Degradation (Decomposition), Translocation.

Evidence was obtained of the rapid translocation of radioactive Diazinon through bean plants and its emergence in bean root exudates maintained under sterile conditions. Diazinon applied at the rate of 3 lbs per acre to soil under non-sterile conditions persisted for as long as 180 days after application. No Diazinon was detectable after 10 wks in soil receiving 0.3 lbs per acre. Diazinon or its degradation products exerted a selective effect common to both soil and rhizosphere microflora which expressed itself in the selective enrichment of a cocoidal rod. After 180 days a large number of the genus Streptomyces appeared as a seeming climax population. The predominant microbial isolate utilized Diazinon as a sulfur, phosphorus, carbon and nitrogen source in that order of preference.

REPORT OF THE COMMITTEE ON PUBLIC WORKS, UNITED STATES SENATE, TO ACCOMPANY S 2670, P 12-53.

Federal Water Pollution Control Act Amendments of 1967 -- 90th Congress, 1st Session, Senate Report No 917, Dec 11, 1967. 42p.

Descriptors: *Legislation, *Grants, Acid mine water, Mine wastes, *Oily water, Water pollution, *Lakes, Projects, Research and development, Model studies, Water pollution control.
Identifiers: Demonstration projects.

The Report discusses the major provisions of S 2760, including the reasons for them and their effect. It also includes a section-by-section analysis of the bill. A new and specific demonstration and research program dealing with both natural and man-made lake pollution is authorized. Projects are also authorized which will demonstrate techniques of controlling or eliminating acid or other mine water pollution. Projects demonstrating control or elimination of such pollution are also directed to be undertaken for entire watersheds or drainage areas. Implementation guildlines are set out. The Bill repeals the Oil Pollution Act of 1924, and adds a new section to the FWPCA, incorporating many provisions of the old Oil Pollution Act. The new section removes the necessity that a discharge be 'grossly negligent or willful' to violate the Act, and expands coverage to include shore installations. Persons who discharge oil are required to remove it immediately or pay all costs of clean-up. A revolving fund is established to enable the Secretary to take immediate action to avoid serious oil pollution. The FWPCA, with amendments contained in the Bill, is included. (R. F. Williams-Fla)

REPORT OF THE COMMITTEE ON PUBLIC WORKS, UNITED STATES SENATE, TO ACCOMPANY S 2760, P 1-11.

Federal Water Pollution Control Act Ammendments of 1967 -- 90th Congress, 1st Session, Senate Report No 917, Dec 11, 1967. 11p.

Descriptors: *Legislation, *Acid mine water, Coal mine wastes, Mine wastes, *Oily water, Water pollution, Political aspects, *Lakes, Project planning, Research and development, Eutrophication, Waste assimilative capacity.

S2760 is an omnibus water pollution bill, which consolidates the provisions of several other bills relating to lake pollution, oil pollution, and drainage pollution from mines, and which amends the Federal Water Pollution Control Act accordingly. The lack of federal legislation concerning lake pollution, special problems of lake pollution, lack of knowledge in this area, and potential solutions are discussed. Since lakes lack the flushing action of running water, their problems differ from those of rivers. Lake eutrophication, or natural deterioration, is accelerated by pollution. Acid and other mine drainage pollution is discussed next. Acid from mines seriously upsets the biological balance in streams and this problem is compounded by the fact that most such pollution comes from abandoned mines. Techniques of abatement of mine drainage pollution are discussed. Oil pollution, and serious cases thereof are next discussed. Oil pollution is usually incedent to the transportation of oil, and is caused by accidents, poor maintenance, carelessness, etc. The Oil Pollution Act of 1924 was found to be inadequate to cover these problems. (R. F. Williams-Fla)

NEW YORK POLLUTION CONTROL POLICY AND LAKE ERIE,
Anselmo F. Dappert.
Industrial Water and Wastes, Vol 9, No 1, pp 29-31, Jan-Feb 1964. 3 p.

Descriptors: New York, *Water pollution control, Neutralization, Sewage treatment, Waste water treatment, *Lake Erie, Taste, Water pollution effects, Acidity, Odor, Domestic wastes, Industrial wastes, Sewage effluents, Silts, Sewage disposal, Legislation, Water law, State governments.

The New York State water pollution control program is based on the concept that all waters which receive or are to receive waste discharges of any kind shall be protected to the extent necessary for the various usages which are officially recognized for such waters. The official recognition of these usages is preceded by a series of steps leading to classification and assignment of quality standards to all waters in the state-fresh surface waters, tidal salt waters and ground waters. Basically, for discharges into Lake Erie waters the policy is to consider each problem in relation to the particular circumstances and the actual or anticipated lake classifications. (R. Smith-Fla)

LEGISLATING CLEAN WATER,
Portia Law School, Beacon Hill, Boston, Mass.
J. R. Flood.
Portia L J, Vol 3, No 1, p 39-43, Fall 1967. 5 p, 9 ref.

Descriptors: *Federal government, *Legislation, *Water pollution, State government, Legal aspects, Social aspects.
Identifiers: Water Pollution Control Act, Water Pollution Control Admin.

The article outlines the history of federal legislation dealing with water pollution. It deals briefly with the acts from the Refuse Act of 1899 to the Water Quality Act of 1965. State legislation is referred to as parallelling the activities of the federal government. The author points out that with the increasing emphasis being placed on water-rights law the common law that has served reasonably well in the past will have to be replaced by new studies, new interpretations and new statutes. (Horner-Fla)

SOUTHEASTERN COMPREHENSIVE PROJECT FOR WATER POLLUTION CONTROL.
Federal Water Pollution Control Admin., Washington, D. C.

Southeastern Comprehensive Project for Water Pollution Control pp 1-12, June 1966. 13 p, 9 photo.

Descriptors: *Federal government, *Water pollution control, Water pollution, *Southeastern U S, River basin development, Legislation, Water quality.

The purpose of this pamphlet is to give an overview of the programs that the federal government has instituted for the Southeastern States in the field of water pollution control. For example, the Federal Water Pollution Control Act of 1956 orders that scientific programs to insure the availability of clean water be developed for all major river basins. The geography and growth of the Southeastern Basin are set forth. Examples of shortcomings in present pollution control measures are given. For example, one third of the municipal sewer systems in the area provide for no treatment whatsoever, and another third provide primary treatment only. Goals are set forth for federal programs, the first being to assist communities in building at least minimum waste treatment facilities and operating them effectively. Present activities of the staff of the Southeastern Comprehensive Project for Water Pollution Control are presented. (Patterson-Fla)

FLORIDA AIR AND WATER POLLUTION ACT.
Fla Stat 403 (1967).

Descriptors: *Florida, *Legislation, *Water pollution, Air pollution, Costs, *Pollution abatement, Permits, Local governments, Recreation, Domestic water, Wastes, Damages, Inspection, Water resources development, Planning, Public health.

This act creates the Florida Air and Water Pollution Control Commission and gives it authority to abate pollution and conserve the waters of the State for domestic, agricultural, industrial, recreational, and other beneficial uses. He sets out enforcement procedures and sets penalties for noncompliance with the Act. It authorizes local governments to establish pollution control programs consistent with the Act. It authorizes variances from the Act upon approval by the Control Commission for the following reasons: (1) There is no practicable means of controlling the pollution involved; (2) Enforcement of the Act would necessitate an unreasonable cost to the individual or corporation concerned; and (3) To relieve or prevent hardship different in kind from (1) or (2) above. The Act sets the tax base of water pollution equipment at its salvage value. The Act allows the state to recover civil damages for pollution of public waters. (Crabtree-Fla)

AN INTERSTATE APPROACH TO WATER POLLUTION ABATEMENT,
Thomas R. Glenn.
Chemical Engineering Progress Symposium Series, Vol 59, No 45, pp 11-14, 1963. 4 p, 1 map.

Descriptors: *Pollution abatement, Water pollution, Water pollution control, Biochemical oxygen demand, Pollutant identification, Public health, Standards, Water pollution treatment, Water quality control, *Domestic wastes, *Industrial wastes, Municipal wastes, Sewage, Sewage effluents, Wastes, Shellfish, Recreation, Water law.

The Interstate Sanitation Commission was created by compact or treaty between New York, New Jersey, and Connecticut for the abatement of existing water pollution and the control of future pollution in the waters of the New York metropolitan area. The Compact recognizes that because of the varied uses of water for bathing, navigation, shellfish culture, fishing, and the disposal of wastes, no single standard of purity is economically practical. Accordingly the waters are divided into two classes: class A - water is expected to be used primarily for recreational purposes; class B - water used for other purposes. The Commission has expended its greatest effort in obtaining the treatment of domestic waste, since this is the source of pathogenic diseases. The jurisdiction of the Commission covers only estuarial and tidal waters and a number of problems not encountered in non-tidal pollution abatement work must be solved. Considerable progress has been made since the Commission was created in 1936, primarily because of the cooperation of many agencies, particularly those charged with pollution control in each of the three member states. CRUSHED LIMESTONE BARRIERS: A BASIC FEASIBILITY STUDY IN THE NEUTRALIZATION OF ACID STREAMS,
Pennsylvania State Univ., University Park.
Robert E. Jarrett, and R. Rupert Kountz.
OWRR Project A-002-Pa. Water Resour Res Publ 2-66, June 1966. 112 p, 13 fig, 8 tab, 5 append.

Descriptors: *Neutralization, *Acid streams, Stream improvement, Hydraulic properties, Calcium carbonate, *Limestones, Hydraulic structures.
Identifiers: Mineral acidity.

In a hypothetical stream a crushed limestone barrier 5 ft deep and 100 ft long seemed capable of successfully neutralizing mineral acidity stemming from sulfuritic minerals when little iron and no silting were present. This basic feasibility study investigated the principle reaction between sulfuric acid and limestone and formulated a barrier design procedure. The relationship between rate of neutralization, mineral acid concentration, fluid velocity, stone size, and head loss was established so further research may develop an inexpensive neutralization method for small streams. The hydraulic properties of crushed limestone were determined; a computational procedure was developed to apply the data for designing barriers. This preliminary engineering data search to satisfy hydraulic and chemical processes simultaneously also determined a shape factor for calculating estimated head loss at different fluid velocities in beds of differently sized particles; and studied the 'overall reaction rate' under various mineral acidity, fluid velocity, and stone size conditions. PERSISTENCE OF RESIDUES AND FATES OF HERBICIDES IN RICE FIELDS AND IN RICE FIELD EFFLUENTS,
California Univ., Davis, Botany Dept.
F. M. Ashton.
Final Rep, Water Resources Ctr, 1967. 4 p, 13 ref. OWRR Project A-013-Cal.

Descriptors: *Rice, *Herbicides, Effluents, Weed control, Aquatic weed control, Pesticide residues, Pesticides.
Identifiers: *Rice fields.

Investigations were undertaken to determine residue levels and persistence of herbicides in ricefield waters, determine fates of herbicides in ricefield plants, and develop improved, safe, and effective chemical weed control procedures for rice. Over 65 new herbicides were evaluated for possible use in control of submersed weeds in rice. Of these, formulations of MDMA-endothall, 06K, chloroxuron, and a copper salt of endothall (TD-294) gave outstanding selective weed control in small scale tests, and all but TD-294 performed well in large scale trials. Aerial applications of granular 06K resulted in such good weed control that rice yield increases of 20 and 40% were obtained in 2 separate fields infested with Chara sp. Information contributed by the molinate study has clarified understanding of the action and fate of this new kind of herbicide and should be very useful in further development for rice growing areas.

THE MEKONG DELTA MODEL,
SOGREAH, Grenoble, France.
Henri Lorgere.
Sci J, Vol 4, No 7, pp 70-75, July 1968. 6 p, 5 fig, 2 ref.

Descriptors: Deltas, Mathematical analysis, Flood, Project planning, Flood damages, Computer programming, Reservoir operation, Flood routing, *Flood control, *Simulation, *River regulation, Rivers, Navigation, Land reclamation, Flood plains.
Identifiers: *Mekong Delta, Mekong River Project, Mathematical models, *Tonle Sap Project, Cambodia.

The Mekong River was dammed by computer simulation on one of the world's largest mathematical models. The computer study, financed by Cambodia, Vietnam, and the United Nations Special Fund, was performed by SOGREAH, took 4 yr, and cost 450,000 pounds. Results showed that the dam would bring important economic benefits to the delta area. Annual flooding in the plains of Cambodia and South Vietnam would be reduced by a proposed dam on the Tonle Sap River, a major tributary of the Mekong. Flood damage to rice crops, towns, roads, and bridges would be lessened; more land would become available for agriculture; and the water supply during the dry season would be increased, benefiting irrigation, navigation, and salinity abatement. The method used for constructing the mathematical model and problem solutions are described. (USBR)

OPTIMIZATION OF THE OPERATION OF A MULTIPLE-PURPOSE RESERVOIR BY DYNAMIC PROGRAMMING,
California Univ, Los Angeles.
Warren A. Hall, William S. Butcher, and Austin Esogbue.
Water Resour Res, Vol 4, No 3, pp 471-477, June 1968. 7 p, 3 fig, 4 ref.

Descriptors: *Optimum use, *Reservoir operation, Hydroelectric power, Multiple purpose projects, Reservoirs, Hydrology, Computer programming, Hydrologic data, Runoff forecasting, Mathematical analysis, Streamflow records, Water storage, Outflows, Storage, Programs.
Identifiers: *Optimization, *Dynamic programming, Mathematical models, Inflow, Firm energy, Shasta Dam, Calif.

The dynamic operation policies for planning complex reservoir systems that produce hydroelectric power and provide water can be optimized for the maximum return from firm water and power and dump water and power. The technique provides for complex constraints such as: (1) mandatory flood control reservations that are variable in time; (2) fish, wildlife, and recreational releases; and (3) navigation minimum flows, evaporation losses, and interbasin diversions. The paper presents the operational analysis of a component reservoir-river system and the procedure used to combine optimally a number of such subsystems into a coordinated, mutually reinforcing, multiple-river system. To ensure the essential practicality of the procedure, the analysis is based on the physical and hydrological characteristics of Shasta Dam, Shasta Lake, and Keswick afterbay on the Sacramento River in Calif. (USBR)

THE OPTIMIZATION OF LARGE SCALE WATER RESOURCE SYSTEMS: OPERA-

LIBRARY U. OF I. URBANA - CHAMPAIGN

TIONAL ASPECTS, PART I: CONCEPTUAL FRAMEWORK,
California Univ., Berkeley, Operations Research Center.
Nathan Buras.
Rep, Univ Calif, Sept 1965. 42 p, 8 fig, 8 ref. OWRR Project A-019-Cal.

Descriptors: *Water resources, Multiple-purpose projects, *Optimum development plans, Municipal water, Industrial water, Irrigation water, Hydroelectric power, Hydrologic data, Inflow, Evaporation, Dynamic programming, Water storage, *Optimization, Linear programming, Water utilization, Mathematical studies.

A water resource system consisting of 4 reservoirs was analyzed with respect to operation in an integrated manner. The reservoirs release water for irrigation, municipal, and industrial uses, and for the generation of hydroelectric power. Requirements are to: (1) determine the maximum amount of firm water and firm power which may be produced by the system, and (2) determine an optimal operating procedure for the satisfaction of the target outputs determined above. Only part (1) is discussed. Optimization of the entire system using dynamic programming was found to be unfeasible due to the large dimensionality of the problem: at least 1 dimension for each reservoir of subsystem. Consequently, the decomposition principle was applied using a combination of dynamic programming (for the optimization of each subsystem) and linear programming (for the optimization of the master program). Hydrological data covering 10 consecutive years and including lowest inflows on record were supplied so that 10 different values of firm water and firm power may be calculated. On that basis of these results, the target outputs for the system as a whole, in terms of firm water and firm power, may be determined.

URBAN ENVIRONMENTAL PROBLEMS,
Univ. of Florida, Gainesville.
R. Albertson.
Eng Prog, Univ Fla, Vol XXI, No 6, Bull 128, June 1967. 98 p, 3 fig, 165 ref. OWRR Project A-999-Fla.

Descriptors: River systems, Abatement, *Federal government, *Natural resources, Institutional constraints, Mathematical studies, *Water law, Transportation, Water policy, Cost analysis, Eminent domain, Riparian rights, *Recreation, *Social aspects, *Environment, *Cities.

Reshaping and properly managing the urban environment poses one of the great challenges to contemporary society. Whether this challenge will be met effectively depends, in part, upon the development of channels of communication and the development of action programs among a wide spectrum of disciplines including law, sociology, regional planning, economics, environmental engineering and political science. Unidesciplinary confrontations with the urban challenge are doomed to failure. Under the umbrella of the University of Florida Water Resources Research Center, Professor E. E. Pyatt organized a graduate seminar, 'Urban Environmental Problems,' which was presented during the Spring Trimester, 1966. The keynote speaker was Dr. Allen V. Kneese of Resources for the Future, Inc, with subsequent presentations by University of Florida faculty from a wide array of departments and colleges. The collected papers, dealing with the economic, legal, political and geographic aspects of the urban environment constitute the content of the subject publication.

WATER RESOURCES AND RELATED PROBLEMS IN THE APPALACHIAN REGION OF GEORGIA,
C. E. Kindsvater.
1st Meeting Water Develop Coord Comm, Asheville, Sep 1965. 8 p. OWRR Project A-999-Ga.

Descriptors: *Water resources, *Georgia, Hydrology, Groundwater, Natural resources, Rivers, Springs, Precipitation (Atmospheric), River basin development, Water supply, Water quality, Flood control, Wildlife, Watershed management, Hydroelectric power, Recreation.
Identifiers: Chattachoochee Riv, Ga, Tennessee River, *Appalachian Region, Ga.

This review of water resources and water problems of the Appalachian region of Georgia reveals general areas of need and opportunities for water development and control. The research on which it was based revealed inadequacies in: (1) basic data, (2) technology, (3) coordinated planning and development. These are not unique nor regional problems, but it is hoped that the work begun on this action program for Appalachia will focus attention on the basic need to plan comprehensively for the optimum utilization for all our national resources.

SOCIAL IMPACT OF METEOROLOGICAL DROUGHT IN ILLINOIS,
Illinois Univ, Urbana. Water Resour Center.
Alfred W. Booth, and Don Voeller.
Res Rep 9, Univ Illinois, Mar 1967. 31 p, 12 ref. OWRR Project A-007-Ill.

Descriptors: *Droughts, *Illinois, *Social aspects, Social adjustment, Psychological aspects, Water supply.
Identifiers: Palmer index.

Drought invariably infers a shortage of moisture in one context or another. Attempts have been made to develop a procedure whereby the relative and absolute impact of this phenomenon can be measured. It was proposed to test the validity of meteorological drought, as defined by the recently derived Palmer Index, by comparing the variability of drought in Illinois with the effects of this phenomenon on various sectors of the State's society. Research was based on the hypothesis that the impact of drought on the social realm varies as drought severity varies. Due primarily to lack of long-term, readily available data and developed methodology for isolating effects of natural phenomenon on man, little conclusive objective evidence was obtained; however, drought has a variable impact: (1) from one sector of society to another at a given time, (2) within the same sector of society in given areas at a given time, (3) in given sectors of society through space, and (4) through time on society as a whole, all because of the nature of man's culture enables him to better cope with the vagaries of nature on one hand and results in his becoming more susceptible to them on the other.

A BENEFIT-COST ANALYSIS OF LOCAL WATER SUPPLY,
Wisconsin Univ, Madison.
W. J. Stober, and L. H. Falk.
OWRR Project B-001-La, Land Economics, Vol 53, No 3, pp 328-335, Aug 1967. 8 p, 1 fig, 1 tab, 6 ref.

Descriptors: *Capital costs, *Cost comparisons, Cost-benefit analysis, *Cost-benefit theory, Depreciation, Diseconomies of scale, *Discount rate, Return to scale, Tax rate, Unit costs, Taxes, *Water supply systems, Investment, *Benefit-cost ratios, *Water supplies, Louisiana, Local governments.

Communities facing an industrial-municipal water shortage have 2 broad courses: either private or public financing of water replacement projects. Whether a communit could supply water at a lower cost can be decided by a benefit-cost analysis (differing from analyses for federal projects). The annual benefit from a community project is the present value of the annual cost savings that would result from the nonundertaking of the privately financed alternatives. The average annual cost to the community is the annual net cash outlay for the purchase of water from the community project at a price just sufficient to cover the project costs. The cost of private alternatives is discounted by the corporate costs of capital; the cost of the community project, by the community's costs of capital. A direct consequence of the corporate income tax structure is that the benefit-cost ratio will always be greater than unity if the returns to scale are constant and if both the community and corporate costs are discounted at the same interest rate. A numerical example based on the corporate tax structure in Louisiana demonstrates that a community-financed project, with its lower costs of capital, almost always will be more favorable than a private one.

A COST-BENEFIT ANALYSIS OF MINE DRAINAGE,
Ohio State Univ, Columbus.
Richard A. Tybout.
Reprints of Pap 2d Symp on Coal Mine Drainage Res, Mellon Inst, pp 334-371, May 1968. 37 p, 15 tab, 14 ref.

Descriptors: *Acid mine water, *Mine drainage, *Water pollution treatment, *Cost-benefit analysis, *Regression analysis, Pennsylvania, Water quality control, Taxes, Assessments, Non-structural alternatives, Standards.
Identifiers: OWRR-grant study, Stream quality.

Costs of abatement of acid mine drainage for coal mines in Pennsylvania are calculated and classified by county. Estimates are based on statistical analysis of the data from the Pennsylvania Dept. of Mines and Mineral Industries' Yellowboy Project. The volume of mine drainage is analyzed as a function of historic patterns of coal production, methods of mining, seam thickness, and hydrologic conditions. Costs are estimated for other areas of Appalachia by comparison with Pennsylvania costs. Secondary costs of unemployment caused by closing of mines for failure to treat waste satisfactorily are also estimated. Benefits are not evaluated. The suggestion is made that in many cases treatment cost is greater than benefit and polluters in such cases should pay downstream users for damages as an alternative to treatment. Annual treatment cost estimates for all Pennsylvania active mines are tabulated. The cost of sealing inactive mines is estimated to be $18-36 million. Tables include treatment plant cost estimates, Yellowboy cost regressions and cost functions, number of draining mines by counties, volume of drainage by counties, average thickness of coal seams, correlation matrix for underground and strip mines, drainage volume regressions, and quality of drainage. WATER RESOURCES PROBLEMS AND RESEARCH NEEDS OF NORTH CAROLINA,
North Carolina Univ., Chapel Hill, Water Resour. Res. Inst.
David H. Howells.
Rep 2, Mar 1967. 53 p, 1 map, 2 append. OWRR Proj A-999-NC.

Descriptors: *Water resources, Conservation, Planning, Quality control, Groundwater, Surface waters, *Research and development, *North Carolina.

This summary of North Carolina's water resources problems and research needs serves as the basis for the Water Resources Research Institute's research program. Subject matter is presented within the four broad categories of water resources planning, water conservation, water quantity management, and water quality management. Attention is given to all currently recognized problems and research needs are identified where additional research will contribute to solutions of these problems. The 63 research needs identified in report are summarized in the appendix by research category and relative priority.

ATTAINMENT OF EFFICIENCY IN SATISFYING DEMANDS FOR WATER RESOURCES,
Resources for the Future.
Irving K. Fox, and Orris C. Herfindahl.
American Economic Review, march, 1964, p 198-206, 20 ref.

Descriptors: *Administrative agencies, Local governments, Benefit-cost analysis, Project evaluation, Federal project policy, Investment, Project planning, Institutional constraints, *Inter-agency cooperation, Optimum development, Plans, Water resources development, *Federal jurisdiction, Pricing, Adoption of practices.

An assessment of the results of existing practices within the federal government upon efficiency is done by examining certain key federal policies which bear on efficiency. One of the most important is that the beneficiaries of a federal water investment project bear only a small portion of the costs. The federal agency involved allies itself with local organizations representing those who will benefit. These interests then dominate the investment decision; what can result is inefficiency resulting from optimistic estimates of benefits and the neglect of cheaper alternatives because most of the pressures are in one direction. Another federal policy that can prove inefficient is the present method of benefit-cost analysis, without application of the marginality principle. Significant errors of concept that are made in evaluation of demand are also pointed out. Suggestions for further exploration of the production function are given as a means to increase efficiency of projects. The desireability of two modifications (1) place greater reliance upon charges and prices in allocation process (2) an independent audit of planning activities are discussed. In conclusion, it is deemed desirable to explore the value of alternative plans even if monetary values are not relevant. (Gargola-Chicago)

MISCONCEPTIONS IN HYDROLOGY AND THEIR CONSEQUENCES,
Colorado State Univ, Fort Collins.
Vujica Yevjevich.
Water Resour Res, Vol 4, No 2, pp 225-232, Apr 1968. 8 p.

Descriptors: *Hydrology, Flood, Forecasting, Ground water, Evaporation control, Climatology, Atmospheric precipitation, Water resources, Flood forecasting, Weather modification, Fluvial morphology, *Errors, Maximum probable flood, Cloud seeding.
Identifiers: Maximum rainfall, Stochastic models, Deterministic model, Risk.

Several misconceptions introduced into hydrology have had adverse consequences on the science and on water resources development. Persistent use of the concept of maximum precipitation and maximum probable precipitation, for which there is no physical proof, has discouraged research into the structure and probability of extreme events, and may have led to an unwarranted sense of security concerning flood control works. Attempts at long-range forecasts of water supply, based entirely on meteorological processes, have misdirected research and raised false expectations. A misconception that hydrologic processes are composed of a limited number of hidden periodicities has retarded the use of modern stochastic analyses of time series. Cloud-seeding to increase numbers of rainfrops rather than their coalescence may have had a negative effect on precipitation in arid regions. Considering ground water as the resource, instead of the aquifer, has stressed the technology of withdrawal at the expense of the study of recharge methods and has led to much unplanned overdraft of ground water. Using descriptive rather than numerical variables has delayed applying modern statistical methods to planning the exploration of the ground-water environment. (USBR)

THE CALIFORNIA WATER PROJECT: IS PUBLIC DECISION MAKING BECOMING MORE EFFICIENT,
Washington Univ, Seattle.
Gardner Brown, Jr.
Water Resour Res, Vol 4, No 3, pp 463-470, June 1968. 8 p, 27 ref.

Descriptors: *Decision making, Projects, *Water development, Multiple purpose projects, *Economics, Project planning, *Water costs, Benefit-cost ratios, Interest (Finance), Capital costs, Cost comparisons, Water resources, Public utilities, Demineralization, Bibliographies, Policy matters, Efficiencies, Water supplies.
Identifiers: *California State Water Proj, California Water Plan, Bureau of Reclamation, Federal government, Evaluation.

The economic soundness of the Calif State Water plan is discussed and the extent to which the plan shows marked improvement over Federal water projects is shown. The study indicates why economists reach different conclusions. Using an incorrect discount rate, applying procedures that overestimate net benefits, and failing to charge a scarcity price for water are inappropriate arguments against the value of the Calif State Water Project. The existence of alternative public investment opportunities and technological progress in desalination are 2 factors to which the State may have given inadequate attention. Although the State's water pricing policy encourages more efficient resource allocation than that of the Federal government, plausible grounds exist for believing that further improvement is possible. ORGANIZATIONAL ARRANGEMENTS FOR WATER DEVELOPMENT,
Resources for the Future and Department of Conservation, School of Natural Resources, University of Michigan.
Irving K. Fox, and Lyle E. Craine.
Natural Resources Journal, April 1962, 44 p, 51 ref.

Descriptors: Economies of scale, Government supports, Market value, Administrative decisions, Water resource development, Intangible costs, Attitudes, Project planning, *Administrative agencies, Adoption of practices, River basin development, *Coordination, Decision making, *Interagency cooperation, *Political aspects, Methodology, Water allocation policy, Motivation.
Identifiers: Welfare maximization.

An analytic structure is given, within which designs of institutional arrangements for water resource development can be formulated. This structure consists of four categories: (1) the requirement of the value system, which is welfare maximization, (2) characteristics of the function of producing water services, which are physical interdependencies, economies of scale, indivisibility of services, and benefits difficult to quantify, (3) integration of planning production facilities, operation of facilities, and distribution and marketing of services produced, (4) economic environment and governmental interrelationships. In light of these, existing U.S. organization for water resource development is reviewed and weaknesses of these arrangements discussed. Suggestions for improvement consist of: (1) application of 'market-like' forces, (3) special machinery to coordinate water policies to other related policies, and (4) machinery to assure presentation of alternatives to entire public. (Gargola-Chicago)

THE SIGNIFICANCE OF WATER RESOURCES AS AN ATTRACTION TO INDUSTRY IN THE TOWN CREEK WATERSHED,
Mississippi State Univ., State College.
Don C. Wilcox, William C. Flewellen, and Guy T. Peden.
Water Resour Res Inst Rep, June 1966. 111 p, 7 fig, 36 tab, 17 ref, 3 append. OWRR Project A-002-Miss.

Descriptors: Water resources, Watersheds, *Industrial water, Ground water, *Industrial plants, *Water management, Municipal water, Flood control, Surface water, Population growth, Economics, Mississippi, Bibliographies, Water resources development, *Industries, Economic impact.
Identifiers: Water use.

A study was conducted to determine the significance of water resources to industrial users in the Town Creek Watershed in northeast Mississippi a sub-basin of the Tombigbee River Basin. Ground and surface water conditions in the area, an analysis of current water usage in the watershed, and an evaluation of future uses and needs in the area were studied. Population, manufacturing employment, manufacturing wages, and municipal water customers were factors used to evaluate the relationship between future water needs and water management.

Descriptors: *Resource development, *Water rights, *Political aspects, *Legal aspects, History, Drainage, Government.
Identifiers: Economics, *Institutions, Lower Rio Grande Valley.

This report studied the legal, political, cultural, and economic institutions and their impact on the water resource development of the lower Rio Grande Valley, Texas. Also studied were the history of

LIBRARY U. OF I. URBANA - CHAMPAIGN

development and the water rights of the area. The methodology used consisted of the examination of the institutional arrangements important to the water development of the area. Through studies of past literature, past and present legislation on the national, state, and local levels, and personal interviews, the various factors were characterized. The study also included a climatic and geographical description of the area. It was found that the water supply is limited, the available supply is not being used efficiently, and that there is a severe drainage problem. It is assumed that if people realize that the value and productivity of their property is lowered by these properties, that the institutions will be altered so that corrective action will be taken. ADJUSTED BENEFIT-COST RATIOS FOR SIX RECENT RECLAMATION PROJECTS,
Resources for the Future, Inc., and University of Washington.
Myrick A. Freeman, III.
Journal of Farm Economics, Vol 48, No 4, Part 1, pp 1002-1012, Nov 1966. 11 pp, 3 tab, 22 ref.

Descriptors: *Federal reclamation law, *Costs, Parity ratios, *Primary benefits, *Secondary benefits, Farm prices, Irrigation.
Identifiers: Economics, *Cost-benefit analysis, *Reclamation.

Six single-purpose projects of the Bureau of Reclamation are reviewed as to the validity of their benefit-cost estimates. The six projects are in Nebraska, Utah, Idaho, Wyoming, and Oregon. Where the benefit-cost estimates were found to be biased, adjustments were made. The estimates made by the Bureau were biased due to their use of a low discount rate, because they counted secondary benefits, and they were over optimistic in their price projections. Also, other sources of bias were not counting the opportunity cost of farm labor, and not counting the opportunity cost of water. The revised benefit-cost estimates are less than one for five of the six projects studied. The author compared estimated project construction costs with realized costs and found the Bureau's estimates to be favorable. (Grossman-Rutgers)

ECONOMIC CONSIDERATIONS IN FORMULATIONS OF NATURAL RESOURCE POLICIES,
Water Resources Council, Washington, D. C.
Harry A. Steele.
Journal of Farm Economics, Vol 48, No 5, pp 1232-1238, Dec. 1966. 7 p, 5 ref.

Descriptors: *Planning, Economic efficiency, *Project life, *Water Resources Planning Act, *Water Resources Council, Benefits, Water quality control.
Identifiers: Economics, Federal Government.

Three purposes of planning are the well-being of the people, economic development, and the preservation of the quality of environment. Plans should be formulated so that they will be comprehensive as to purpose and effects. The following criteria are to be considered in the initial formulation of a plan: tangible benefits should exceed tangible costs; each separable unit or purpose should provide benefits at least equal to its cost; scope of development should provide maximum net benefits; and, there should be no more economical means of accomplishing the same purpose. A second step would be to take account of the intangibles. The length of the project should not exceed 100 years. Current rates should be used. The economic considerations of the Water Resources Council are examined as are the various titles under the Water Resources Planning Act. Four opportunities for the improved application of economics to water resource planning are discussed. (Grossman-Rutgers)

ON THE QUANTITATIVE INVENTORY OF THE RIVERSCAPE,
U S Geological Survey, Washington, D. C., Water Resources Division.
Luna B. Leopold, and Maura O'Brien Marchand.
Water Resources Res, Vol 4, No 4, pp 709-717, Aug 1968. 8 p, 5 tab, 8 ref.

Descriptors: *Aesthetics, *Scenery, *Valleys, California, River basin development, Recreation, Conservation, Watershed management.
Identifiers: *Riverscape inventory, Sampling problems, Scarcity evaluations, Scenic misfits.

In the Berkeley, California area, 24 minor valleys were described numerically in terms of factors comprising social or aesthetic values chosen to represent aspects of riverscape. At each site 28 factors were evaluated. Some were directly measurable, others were estimated, but each observation was assigned to one of five categories for the factor. Each factor for each site was then expressed as a uniqueness ratio, which depended on the number of sites being in the same category. The uniqueness ratio is believed to represent one way in which the scarcity of a given riverscape can be ranked quantitatively without bias based on notions of good or bad, and without assigning monetary value. It is suggested that a classification of scarcity is feasible that can lead to a technique for river survey adaptable in a basic data program in addition to the usual hydraulic and hydrologic factors. Scarcity evaluations might be applied in making choices among alternatives in river basin development. quifer divided by its effective porosity. The distribution coefficient for an ideal tracer is zero; the average velocity of this tracer is equal to the average groundwater velocity. (Knapp-USGS)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

ESTIMATING COST OF GROUND-WATER WITHDRAWAL FOR RIVER BASIN PLANNING,
U S Geological Survey, Water Resources Division.
Este F. Hollyday, and Paul R. Seaber.
Ground Water, Vol 6, No 4, pp 15-23, July-Aug 1968. 9 p, 7 fig, 3 tab, 13 ref.

Descriptors: *Groundwater, *Withdrawal, *Cost comparisons, *Water yield, Unit costs, Specific capacity.
Identifiers: *Cost of groundwater, Potential yield, Susquehanna River basin.

Groundwater costs were estimated in comprehensive planning of water resources development including appraisal of alternative sources of supply in the Susquehanna River BASIN. Log-normal plots on log-probability paper of specific capacities adjusted to 180 days of pumping were used to estimate yields of 65 aquifers. The estimated yields at the 25, 50, and 75% probability levels were obtained using hypothetical well design and selected drawdowns. Unit water costs were calculated from well construction, electrical power, and maintenance costs, all from standard sources. Estimated water costs range from $0.11 per 1.000 gal at 15 gpm to $0.004 per 1,000 gal at 9,000 gpm. A yield of 50 gpm costs $0.060 in shale or interbedded sandstone and shale, and $0.050 in metamorphic rock. A yield of 100 gpm costs $0.043 in shale and interbedded sandstone, and $0.032 in carbonates. A yield of 500 gpm costs $0.020 in sandstone, $0.015 in carbonates, and $0.012 in clacial sand and gravel. A yield of 1,00 gpm costs $0.009 in glacial sand and gravel. Cost differences are caused mainly by differences in pumping levels. (Knapp-USGS)

AUGUSTA POWER CO V US (COST REPAYMENT FOR FLOWAGE EASEMENT).

278 F 2d 1-5 (5th Cir 1960).

Descriptors: *Judicial decisions, *Easements, Eminent domain, Cost repayment, *Compensation, *Land appraisal, Condemnation value.
Identifiers: Flowage easements.

U S (defendant here) filed notice of civil con demnation proceedings with Augusta Power (plaintiff) on lands over which plaintiff held flowage easements. Commissioners found that the criterio for dividing the value of the land in compensatin the owners of the fee and plaintiff's flowage easements was the difference in the value of the lan with and without the flowage easement. Thi method for fixing the compensation was approve by the US District Court for the Southern Distric of Georgia. Both parties appealed. The US con tended that, without a showing by the plaintiff, tha it ever intended to use the easements, no compen sation should be paid for their taking. August Power contended conversely that the compensa tion determined was not enough. This cou reversed, holding that the standard used by th commissioners was erroneous. While a flowag easement doubtless lessens the value of the fe owner's interest, it does not necessarily follow th the amount of such decrease and the value of th flowage easement to its owner is identical. Th maximum compensation payable for such eas ments is so much of the useful value of such lan as the easement owner has a right to destroy depreciate. The actual measure of the compens tion being the practical value of the easement to i owner. (Blunt-Fla)

SMALLWOOD V CONNER (REASONAB VALUE OF RIGHT TO WELL USE IMPLIED).

162 S E 2d 747-748 (Ct App Ga 1968).

Descriptors: Georgia, Judicial decisions, Le aspects, Usufructuary right, Water rights, *We Value.

Conner conveyed to Smallwood a lot by warra deed, excepting therefrom a 25-foot square i corner on which was located a well. Right to the well and to lay pipe was given. Some years la Conner sued Smallwood, claiming $195 as due o water bill, and obtained a judgment. The court the instant case affirmed. The court stated that

cept as between very near relatives, when one accepts services from another or is given a right to use a facility, a promise is implied to pay the reasonable value thereof. While the warranty deed in dispute clearly conveyed the right to use water from the well, it contained no provision whatsoever that the grantor would supply use of the water free of charge. The court affirmed that $3 per month was a reasonable charge. (Patterson-Fla)

WE NEED MORE MUNICIPAL WASTE TREATMENT WORKS,
David H. Howells.
Civil Eng, Vol 33, No 9, pp 54-55, Sept 1963. 2 p.

Descriptors: Legislation, Water law, *Water pollution control, *Federal government, Pollution abatement, Water pollution treatment, Navigable waters, Municipal wastes, Industrial wastes, Legal aspects, State governments, Local governments, Federal project policy, *Cost sharing, Sewage treatment, Waste treatment.

There are 5,831 cities and towns in the United States, representing over 35 million people, that need new or enlarged plants for the treatment of municipal wastes. The cost of this backlog of needed treatment plants, interceptor and outfall sewers, and other ancillary works, has been estimated at 2.2 billion dollars. The Federal Water Pollution Control Act of 1956, provided the first real impetus to the control of pollution from municipal wastes by authorizing annual appropriations of 50 million dollars for grants of up to 30 percent of the cost of sewage treatment works. In 1961, the Congress amended the Act of 1956 to authorize an increased annual appropriation of 80 million dollars for 1962, 90 million for 1963, and 100 million for 1964 through 1967. It also encouraged communities to construct joint rather than separate projects and increased the 30 percent grant limitation from 250,000 dollars to 600,000 dollars. (R. Smith-Fla)

LEGAL ASPECTS STIMULATE POLLUTION CONTROL PROGRAM,
Murray Stein.
Civil Eng, Col 32, No 7, pp 50-51, July 1962. 2 p.

Descriptors: Legislation, Water law, *Water pollution control, *Federal government, Pollution abatement, Water pollution treatment, Navigable waters, Public health, Water pollution sources, Municipal wastes, Industrial wastes, *Legal aspects, State governments, Local governments, Missouri River.

Remedial waste collection and treatment facilities for municipalities and industries on the stretch of the Missouri River from Sioux City to St. Louis, costing an estimated $350,000,000, are currently in various stages of construction. Much of this activity may have resulted from the four federal enforcement actions taken to abate the pollution of this stretch of the river under the Federal Water Pollution Control Act of July 1956. This article examines in depth the various sections of the Act and concludes that it truly comprises a comprehensive statutory basis for the federal role and responsibility in the prevention and control of water pollution. Since the start of the program in 1956, a total of 2,746 communities began construction of treatment plants with federal funds made available under the act. The total cost of these projects was $1,293 million of which 17% were federal funds. (R. Smith-Fla)

UNDERGROUND-WATER RECLAMATION GRANTS.
43 USCA Secs 351-360 (1964).

Descriptors: *Federal reclamation law, *Permits, Exploration, Drilling, *Water resources development, Patents, *Subsurface waters, Subsurface investigations, Nevada, Federal government, Mineralogy, Coals, Public lands, Reclamation, Regulation, Federal reservations.
Identifiers: *Secretary of the Interior, Land disposal.

Section 351 empowers the Secretary of the Interior to grant exclusive two-year permits to United States citizens to drill for water beneath the surface of designated public lands of the United States in Nevada. Section 352 authorizes the Secretary to designate the lands subject to disposal under this chapter. Section 353 prescribes the procedure and fees for obtaining such a permit. Section 354 empowers the Secretary to cancel the permit under specified conditions. Section 355 entitles the permittee to a patent over one-fourth of the land embraced in the permit if he discovers and develops a specified quantity of water within two years. Section 356 authorizes the Secretary to grant a two-year extension of the time limit. Section 357 provides for the disposition of lands not included in the patents; under Section 358 the proceeds from such dispositions go into a specified reclamation fund. Section 359 reserves to the United States all the coal and other valuable minerals in the lands entered and patented, plus the right to mine and remove them. Section 360 empowers the Secretary to promulgate any regulations necessary to achieve the purposes of the chapter. (Smodish-Fla)

ESTIMATING CONSTRUCTION COSTS,
Day and Zimmermann Consulting Services, Inc.
Thomas W. Hopper.
Consult Eng, Vol 31, No 2, pp 94-98, Aug 1968. 5 p, 1 tab.

Descriptors: *Construction costs, *Estimating, Costs, Overhead costs, Contracting, Bids, Depreciation, Unit costs, Finance, Materials, Foreign construction, Feasibility studies, Consulting engineers, Investigations, Scheduling, Labor.
Identifiers: Agency for Intl Dvlpmt, Construction materials, Profits, Equipment.

The most important uses of construction cost estimates are determining project feasibility and the amount of required financing. In 1967, the Agency for International Development requested an investigation of methods used by consulting engineers and contractors in preparing construction cost estimates for large civil works projects. The investigation revealed that: (1) not enough time is spent on estimating construction costs; (2) engineers concentrate on direct costs and do not thoroughly consider indirect costs that must be included; and (3) the contractors' business costs, including risks, escalation, and legal requirements, are overlooked or not covered sufficiently. Information used in the estimating process should be developed from four sources: site conditions, work division and quantities, construction program, and unit costs. Costs are divided into direct costs (those associated with specific construction operations) and indirect costs (those related to the general construction operation) such as in administrative overhead. Two important estimate items are project mobilization which can be a large part of the project cost, and markup which should be 15 to 20% of the total cost for an average road project in an underdeveloped country. THE MEASUREMENT AND COMPARISON OF COSTS FOR ALTERNATIVE WATER REPLACEMENT PROJECTS,
Louisiana State Univ., Baton Rouge.
L. H. Falk, and W. J. Stober.
Louisiana Water Resour Res Inst Bulletin 2, Oct 1966. 33 p, 1 fig, 7 tab, 13 ref, append. OWRR Project B-001-La.

Descriptors: *Cost comparisons, Costs, *Water supply, Ground water, Wells, Municipal water, *Water costs, Economics, Taxes, Construction costs, Capital costs, Water rates, Water wells, Cost analysis.
Identifiers: Water plans.

Water replacement projects may be undertaken by water users individually or by collective community action. Cost is a primary determinant in the choice among alternative projects. The cost concept relevant for such comparisons is the present value unit cost of water, which may be viewed as an internal price just sufficient to cover all costs. This may be computed by discounting all costs and water outputs by the cost of capital to the sponsoring agency. Calculations indicate that the nonprofit community project can supply water to corporate users at a lower cost than that at which corporate users can supply their own needs. This is attributed to (a) the corporate income tax structure, and (b) the lower cost of capital to the community project. The results of detailed calculations for a hypothetical project are presented in tabular form. In addition, a graph is included that shows the extent to which construction costs for the community project must exceed those for the corporate project to equalize the costs of water from the 2 alternatives.

ECONOMIC CONTROL OF GROUNDWATER RESERVES,
Missouri Univ, Columbia, Dept. of Agricultural Economics.
Oscar R. Burt.
Journal of Farm Economics, Vol 48, No 3, Part 1, pp 632-647, Aug 1966. 16 p, 14 ref.

Descriptors: *Temporal distribution, Costs, *Optimization, *Markov processes, *Mathematical studies, *Functional equations, *Commonality.
Identifiers: Economics, *Groundwater basins.

A framework is developed for the derivation of optimal ground water policies based on sequential decision theory. The policies are based on temporal allocation. The commonality problem is the primary consideration. Two criterion are chosen. The first criterion is the expected present value of net output from the basin. The deviation and solution of the functional equation to maximize this criterion is discussed. The second criterion is the dispersion of net output. Throughout the discussions, the context of net social benefit as a prerequisite for an economic solution is maintained. Markov process analysis is combined with the other mathematical techniques in deriving the optimal solution to the commonality problem. (Grossman-Rutgers)

EFFECTS OF HIGHLY MINERALIZED WATER IN HOUSEHOLD PLUMBING AND APPLIANCES,
Black and Veatch, Construction Engineers, Kansas City, Missouri.
W. L. Patterson, and R. F. Banker.
J Amer Water Works Ass, Vol 60, No 9, pp 1060-1069, Sept 1968. 10 p, 7 fig, 2 tab.

Descriptors: *Corrosion, *Plumbing, *Damages, *Domestic water, *Cost analysis, Water quality, Hardness (Water), Salinity, Dissolved oxygen, Sulfates.
Identifiers: Household plumbing life.

The effects of total dissolved mineral content of domestic water on service lives and annual costs of items of household plumbing and appliances are estimated. The average household plumbing investment is about $1,100. Study of 38 communities shows reductions in service life of 30% in washing machines to 70% in toilet flushing mechanisms from the effect of water of 1,750 ppm. The annual

LIBRARY U. OF I. URBANA - CHAMPAIGN

cost of such reduction is about $40. The indirect capital costs of reduced life amounts to about $0.40 per 1,000 gal, which exceeds the price of water in many communities. The waters studied had mineral contents not commonly affected by water treatment. The constituents listed are TDS, hardness, sulfate, chloride, and dissolved oxygen. The data obtained in the community surveys are tabulated. (Knapp-USGS)

6D. Water Demand

WATER BASED RECREATION IN NEVADA - TAHOE,
Nevada Univ., Reno, Water Resour. Res. Center.
George A. Myles.
Prog Rep 3, Nov 1966. 22 p, 1 photo, 7 tab. OWRR Proj A-004-Nev.

Descriptors: *Recreation facilities, *Recreation demand, *Nevada, *Expenditures, Beaches, Camping, Camp sites, Lakes, Reservoirs, Social aspects, Tourism, Use rates, Water demand.

National studies estimate that the U S population will double by the year 2,000, but that in this same period the demand for outdoor recreation will triple. With Nevada's rapidly expanding population, estimated to be 500,000 in 1966, and increasing tourist travel by automobile, it is likely that the demand for water based recreation within the state will exceed national averages. The purpose of this study is to provide information concerning: (1) the use of water based recreational areas, (2) desire for satisfaction with facilities and services, (3) the using public's willingness to pay for use of areas and facilities, (4) the expenditures of visitors, and (5) characteristics of recreational users and the effect of these characteristics on demand for various areas, facilities and services. A survey was conducted at major water areas providing information for all of Nevada's major water recreation areas. Results are given for each area because each has its own peculiarities and information is more meaningful on an area basis. A summary of and recommendations for all areas are provided. This work is concerned primarily with Lake Tahoe located in the Sierra Nevada Mountains at 6,000 ft.

SOME OBSERVATIONS ON THE LAW OF WATER ALLOCATION AS A VARIABLE IN INDUSTRIAL SITE LOCATION,
Wisconsin Univ., Madison.
Sheldon J. Plager.
Wis L Rev, Vol 1968, No 3, pp 673-692, 1968. 20 p, 112 ref.

Descriptors: Michigan, Georgia, Water law, Riparian rights, Natural flow doctrine, Reasonable use, *Industrial plants, *Water allocation (Policy), Public benefits, Water utilization.

The article compares water allocation patterns obtaining in a natural flow jurisdiction (Georgia) with those of a reasonable use jurisdiction (Michigan). The patterns are evaluated from the viewpoint of the industrial water user and from that of the public interest in optimum water usage. In a natural flow jurisdiction maximum protection of water supply investment is obtained by locating the plant on riparian land at the furtherest downstream point that a riparian use is possible, thus minimizing the limitation to use created by downstream riparians' rights to natural flow. In reasonable use jurisdictions the opposite is the case, since reasonable use by those upstream (regardless of the time of their arrival) could cut into the lower owner's rights. Courts are less likely to include public interest as a significant factor in the decisional process in a natural flow jurisdiction. Illustrative of the manner in which water laws have often operated in substantial disregard of water facts, defeating the public interest in optimum water use, is the Michigan preference for the upper user in a climate where evaporation losses are small. The converse is the case in Georgia. (MacMillan-Fla)

RAW ENERGY SOURCES FOR ELECTRIC GENERATION,
Ebasco Services Inc, New York, N Y.
F. A. Ritchings.
Inst Elec Electron Eng Spectrum, Vol 5, No 8, pp 34-45, Aug 1968. 12 p, 9 fig, 9 tab.

Descriptors: *Electric power production, Nuclear powerplants, Electric power, Nuclear energy, *Energy, *Hydroelectric power, Costs, Atmospheric pollution, *Consumption, *Forecasting, Resources, Resource development, Water resources, Economics, Transportation.
Identifiers: Electric utilities, Gross national product, Investment, *Fossil fuels, *Nuclear fuels.

The energy picture in the United States through 1985 is outlined. Predictions are that by 1985 nuclear sources will provide more than 40% of the total raw energy for electric power generation in the U S, ranging from 25% in the southwest to more than 70% in New England. Forecasts are based on several factors, including economics, present and future estimates of fuel availability, plant size, transportation, and air pollution. On a national basis, predictions are that consumption of all forms of raw energy for electric generation will increase substantially from now to 1985, with nuclear energy making the greatest gains. (USBR)

ELECTRIC POWER DEVELOPMENT IN THE USSR.

Water Resour J, pp 67-79, Dec 1967. 13 p.

Descriptors: *Electric power production, *Planning, Economics, Thermal power, River basin development, Hydroelectric power, *Foreign countries, Research and development, Natural resources, Costs, Benefit-cost ratios, Transmission (Electrical), Administration, Operation and maintenance, Analysis, Management, Population.
Identifiers: *Rural electrification, Economic evaluation, *Developing countries, Economic growth, Nuclear power, USSR.

Experiences in electric power development in the USSR are related to comparable conditions in developing countries in Asia and the Far East which are anxious to accelerate the electrification program. Research work completed in developed countries can be beneficial to the developing countries of the Economic Commission for Asia and the Far East regions. Broad classifications of techno-economic aspects requiring consideration in the field of electric power production are: (1) planning studies for developing natural energy sources, (2) implementing and administering projects under a comprehensive development plan, and (3) solving technical problems of layout, design, construction, and operation and maintenance of the projects. Observations and conclusions of participants in a seminar and study tour hosted by the USSR are discussed. The seminar and study tour began in Leningrad, proceeded to Volgograd, Yerevan, and Kiev, and ended in Moscow. (USBR)

Identifiers: *Water transfer, *Water plans, *Canada, Water shortages, Surplus water, *Export, Treaties, *Import, Inter-basin transfers.

A review is given of various aspects associated with exporting water from one country to another. The first part of the paper deals with the general criteria that must be satisfied before export can be contemplated; the second part describes the application of these criteria to the Canada-United States situation. The continent is divided into 3 regions: mountain west, prairie, and east. Canada's surplus water in the foreseeable future and the approximate cost of providing it to the U S are calculated for each region. The surplus surface water is 100,000,000 ac-ft/yr in the mountain west, 100,000,000 ac-ft/yr in

the prairie region, and 200,000,000 ac-ft/yr in the eastern region. (USBR)

NORTHWEST-SOUTHWEST WATER DIVERSION - PLANS AND ISSUES,
Oregon Univ., Eugene.
Chapin D. Clark.
Willamette Law J, Vol 3, No 4, pp 215-262, 1965. 48 p, 143 ref. OWRR Project A-002-Ore.

Descriptors: Water resources, *Diversion, Water law, Arizona, Interstate compacts, States (Geographical), Underwater, Aqueducts, *Reviews, Bibliographies, Policy matters, *Water transfer, California, Pacific Northwest U.S., Legal aspects.
Identifiers: *Water plans, Water shortages, Pacific Southwest, Pacific SW Water Plan.

Inter-regional diversion of water in the western half of the United States is the most important and controversial issue concerning the management of natural resources presently faced by Congress. Its expense and its precedent require that the existing assumptions about the nature of the water problem and the techniques for its solution be reexamined. The present Congress (89th, 2d Session) may authorize a feasibility study leading to the augmentation of the Colorado River by the transfer of water from the Pacific Northwest. In view of the imminence of the decision, the objective of this article is to present an overview and bibliography of the Northwest-Southwest water diversion issue. The article summarized (1) the political evolution of NW-SW diversion proposals, (2) the physical and institutional factors which press for the acceptance of diversion, and (3) the various diversion schemes suggested by engineers. It concludes with a sketch of the policy issues which are posed by an inter-regional diversion.

WATER: AS A FACTOR TO ATTRACT INDUSTRIES,
Ministry of Agriculture, Ankara, Turkey.
Ismail Sener.
Univ Nebraska, Agr Exp Sta, Rep No 45, March 1967. 18 p, 1 tab, 17 ref. OWRR Project A-004-Nebr.

Descriptors: Water demand, *Water costs, *Locating, *Water supply, Water utilization, Economics, Water quality, Industrial water, Reviews, *Industries, Water shortage.
Identifiers: Allocations, Water facilities, *Industrial development.

Water as a required resource for industry has received nationwide attention in recent years. This study is based largely on a review of literature and interviews with researchers. Water requirements by industry vary--among 38 industries the range is from 80 gallons per gallon of whiskey to 1,920,000 gallons per ton of aluminum. Technology exists that can greatly reduce water requirements--water use per ton of output varies from 1400 gallons to 65,000 gallons for steel and from 1500 to 70,000 gallons for sugar. Site selection by industry is based on many factors considered more important than water because water costs are generally low. A 100% increase in the cost of water to 5 heavy water using industries would increase cost of products less than 1%. The cost of water is generally so low that economic principles are not applied in its use or allocation. The importance of water as a factor in locating industry often has been exaggerated.
W69-00650

PROJECTED RESIDENTIAL WATER REQUIREMENTS FOR THE PLATTE AND GREEN RIVER BASINS IN WYOMING; 1965-2010,
Wyoming Univ., Laramie, Coll. of Commerce and Industry.
James C. Kildebeck, Orman H. Paananen, and John W. Birch.
Wyo Water Resour Res Inst Ser No 5, Univ Wyo, July 1967. 50 p, 2 fig, 40 tab, 2 appen. OWRR Project A-001-Wyo.

Descriptors: *Water requirements, Forecasting, Statistical methods, Water utilization, Estimating equations, Time, Temperature, Costs, *Wyoming, Variable costs, Water consumption, Water demand, *Domestic water, *Municiapl water.

This report provides estimates of long-term residential water requirements for the Platte and Green River Basins of Wyoming. Estimates of residential water use are shown by 5-yr intervals for counties and the entire basin area. Estimates are preliminary and additional research now underway may provide additional evidence to modify initial estimates. Projections are derived from mathematical estimating equations in which temperature, water cost, and time are used as variables for estimation of per capita water consumption. Water consumption data were obtained from a survey of 6 communities in the Platte River Basin (comprising about 2/3 of the basin population), and from Rock Springs and Green River in the Green River Basin. For Platte River Basin, total residential water consumption is expected to increase from 8.3 million gallons/yr in 1965 to 38.3 million gal/yr by 2010. While population in the Platte River Basin is expected to nearly double during this time period, residential water consumption is expected to increase 4 to 5 times. Green River Basin, residential water consumption is expected to increase from 2 million gallons per year in 1965 to 5.4 million gallons per year in 2010.

ECONOMIC IMPACT ON SOUTHWESTERN WYOMING OF RECREATIONISTS VISITING FLAMING GORGE RESERVOIR,
Wyoming Univ., Laramie.
Rodney C. Kite, and Willard D. Schutz.
Wyoming Agr Exp Sta Res J 11, Aug 1967. 24 p, 11 tab, 11 ref, 2 append. OWRR Project A-001-Wyo.

Descriptors: *Recreation, Boating, Demand, Water demand, Wyoming, Input-output analysis, Expenditures, *Economic impact.
Identifiers: *Flaming Gorge Resvr, Utah, Upper Green River, Interviews, Transactions.

The purpose of this study was to analyze the economic impact of expenditures by recreationists visiting Flaming Gorge Reservoir in Southwestern Wyoming in 1962. Through the use of personal interviews, average expenditure for 173 parties was determined. The expenditure was $10.68 per party, with the largest part, $5.26, being spent for gasoline and oil. The Leontief static, open input-output model was used in analyzing economic impact. An overall multiplier of 2.067 was found. This expanded direct benefits from $529,728 to a total benefit of $1,094,798. Sectors receiving the greatest total benefit were, in order of importance: (1) gasoline service stations, (2) other retail, (3) general wholesale, (4) households, and (5) food and beverage establishments. This study is important in showing impact of recreational spending. An appendix presents details on the input-output model including the transactions matrix, the input coefficients, and the multiplier matrix for the study area.

6E. Water Law and Institutions

LECTURES ON LAW IN RELATION TO WATER RESOURCES USE AND DEVELOPMENT,
Univ. of Connecticut, Storrs.
William C. Kennard.
Inst Water Resour, Univ Connecticut Rep 2, Mar 1967. 27 p, 12 ref. OWRR Project A-999-Conn.

Descriptors: *Water law, Riparian rights, Prior appropriation, Water management (Applied), Water pollution control, *Water rights.

Four lectures on water law given in the seminar program of the Institute of Water Resources at the University of Connecticut during the fall semester of the 1966-67 academic year are given in this publication. Dr. F. J. Trelease of the University of Wyoming discussed and contrasted the doctrines of prior appropriation in the western states and riparian rights in use in the eastern states. He stressed the need for a good, comprehensive water use code. Mr. J. J. Curry discussed the role and problems of the Connecticut Water Resources Commission in administering water legislation. Such a group plays two roles; to prevent or discover and eliminate unreasonable use and to develop methods by which riparians can make increasing use of their water rights without detriment to others. Mr. I. L. Newell of the Henry Souther Engineering Co. of Hartford stated that in Connecticut the control of water and wastes is given to two separate agencies, the State Department of Health and the Water Resources Commission. He commented on the recommendations of the Clean Water Task Force. In the final lecture, Mr. W. M. Champion of the University of Mississippi commented on development of policy with regard to water law and the administration of a water rights system.

BIBLIOGRAPHY ON MONTANA'S WATER AND RELATED LANDS RESOURCES,
Montana Univ., Missoula, Water Resour. Res. Center.
Richard G. Sheridan.
Rep 1, Mont. Univ, Dec 1966. 81 p, 947 ref. OWRR Proj B-004-Mont.

Descriptors: *Bibliographies, *Montana, *Water resources, *Land resources, Dams, Agriculture, Irrigation, Reservoirs.

This bibliography has been prepared to make available to researchers, educators, and the general public source materials about Montana's water and related lands resources. In Montana, as in other states, it is difficult to find collected in one place all published materials relating to this subject. In this bibliography an attempt was made to be as complete as possible. Books and articles have been arranged by the limited subject within the water resources field. In addition, a number of sources of general concern to the student in this area are collected near the end of the bibliography. The material relating to governmental administration of water resources is particularly complete. Finally, the bibliography concludes with a list of organizations in the state who have particularly concerned themselves with water resources activities in Montana.

A COMPREHENSIVE WATER AND RELATED LAND RESOURCES PLAN FOR THE STATE OF NEVADA,
Nevada Dept. Conserv. and Natur. Resour., Carson City.
Hugh A. Shamberger.
Inventory Series 1, July 1967. 38 p. OWRR Proj A-999-Nev.

Descriptors: Planning, State governments, Federal government, *Nevada, Census, Resource develop-

LIBRARY U. OF I. URBANA - CHAMPAIGN

ment, Land use, *Land resources, *Water resources, Natural resources, *Water resources development.

This is the first report in the inventory series prepared for the Nevada Department of Conservation and Natural Resources. The data contained in the Inventory Series will lay the foundation for the preparation of a Water and Land Resources Plan for Nevada. It has long been realized that a directory of federal and state agencies working in the field of natural resources in Nevada would be helpful and to be effective must be kept up-to-date. It is planned to revise this directory at least every 2 yrs.
W69-00462

UNITED STATES V BIGAN (VIOLATION OF RIVERS AND HARBORS ACT-REMEDY).
274 F 2d 729-733 (3d Cir 1960).

Descriptors: Legislation, *Judicial decisions, *Rivers and Harbors Act, *Navigation, *Federal government, Rivers, Navigable rivers.

Defendant operated a strip mining operation at the top of a hill above the Allegheny River. It piled excess earth on an abandoned mining road near the bank of the river. A torrential rain washed this earth, along with brush and trees, into the river creating a bar extending about fifty feet out from the shoreline. The United States brought suit against defendant alleging a violation of the Rivers and Harbors Act, and seeking to invoke the mandatory injunction provision of the Act. The District Court found that such provision could be invoked only to force removal of structures such as docks, constructed in violation of the Act (Sec 10) and that conditions were not such that the court should use its general equity power. This court affirmed, stating that the defendants conduct was negligent and in violation of the Act, but was not the type of violation for which the Act authorizes a mandatory injunction. The court also accepted the findings of the District Court that the situation did not call for the exercise of the general equity power. (R. F. Williams-Fla)
W69-00468

UNITED STATES V GRAND RIVER DAM AUTHORITY (FEDERAL FLOOD CONTROL UNDER COMMERCE CLAUSE).
363 US 299; 80 S Ct 1134-1139 (1960).

Descriptors: *Judicial decisions, Legislation, Navigable water, Navigable rivers, *Federal-state water rights conflicts, Compensation, Condemnation, Federal government, Federal Power Act, *Hydroelectric plants, *Tributaries, Dams, Non-navigable waters.

Respondent was created by the Oklahoma legislature to develop hydroelectric power on the non-navigable Grand River, a tributary of the navigable Arkansas River. It obtained a license under the Federal Power Act and constructed a project on the Grand River. Later, the federal government incorporated the Grand River into its comprehensive plan for the regulation of navigation, flood control, and power production on the Arkansas and its tributaries. It constructed a project on the Grand River, and in connection therewith, condemned a tract of respondent's land, acquired flowage rights over these lands, and paid for relocation of transmission lines. Respondent claimed additional compensation for the taking of its water right and franchise to develop hydroelectric power. The Court of Claims found the U S liable and on certiorari, the US Supreme Court reversed. The power of flood control extends to tributaries of navigable streams. Deprivation of the opportunity to use water for power production in these circumstances is not compensable because of Congress' superior rights under the Commerce Clause. Since no property was taken from respondent, compensation was not required under the Fifth Amendment. (R. F. Williams-Fla)
W69-00470

LOBEAN V TRUSTEES OF THE INTERNAL IMPROVEMENT FUND (TITLE TO SUBMERGED LANDS).
118 So 2d 226-230 (1st DCA Fla 1960).

Descriptors: *Beds, *Ownership of beds, *Taxes, Boundaries (Property), Real property, Florida, Beds under water, Judicial decisions.
Identifiers: Estoppel.

The Trustees of the Internal Improvement Fund issued a Murphy Act deed to the plaintiff in 1946. The deed purported to convey certain submerged lands. In 1956, the trustees advertized a large area of land, including the plaintiff's lot, for sale and the plaintiff brought suit to enjoin such sale. The court held that the Murphy Act deed which the Trustees sold was void and conveyed no title or interest because the lands were submerged and were therefore sovereignty lands not subject to taxation. However, the court held that the Trustees were legally estopped to question the validity of the Murphy Act deed they had issued in 1946. The court did not reach the question but indicated that the Trustees might also be equitably estopped to question the deed. (Horner-Fla)
W69-00471

BOUDREAUX V LANDRY (INTERFERENCE WITH EASEMENT FOR ACCESS TO STREET).

120 So 2d 535-538 (1st Cir Ct App La 1960).

Descriptors: *Judicial decisions, Louisiana, *Easements, *Drains, Ditches, Prescriptive rights, Roads, Access routes.

Plaintiff owned land on the south side of a street. Between his land and the street was a five-foot strip of land. The owner of this strip conveyed an easement to plaintiff for access to the street. Several years later the defendant, police juror for the area, desired to deepen and extend a ditch which was partly on the strip of land. The defendant secured the assent of the owner and commended work over the objections of plaintiff. Plaintiff brought suit for an injunction and damages, claiming that construction of the ditch without his consent constituted a taking of his property without compensation. The trial judge found that plaintiff's restricted right of access to the street was not taken. This was affirmed on appeal. The court held that plaintiff's servitude was only for access directly across the strip. The ditch had not been extended to plaintiff's driveway, so his access had not been interfered with. The court stated that damages would lie if plaintiff's access to the street was interfered with. (R. F. Williams-Fla)
W69-00472

CENTRAL AND SOUTHERN FLORIDA FLOOD CONTROL DISTRICT V GRIFFITH (NAVIGATION RIGHTS OF RIPARIAN OWNER).
119 So 2d 423-426 (3rd DCA Fla 1960).

Descriptors: *Judicial decisions, Florida, Riparian rights, Canals, *Navigation, Navigable waters, *Public rights, Dams.
Identifiers: Private rights.

Plaintiff, a riparian owner on a canal, brought suit to enjoin the Central and Southern Florida Flood Control District from constructing a salt water control dam on the canal between plaintiff's land and Biscayne Bay. Plaintiff contended that such a dam would deprive it of its right to have unobstructed navigation and access to Biscayne Bay. Plaintiff had no interest in the land which was condemned for construction of the dam, or in the bed of the canal. The chancellor found that the canal was a private navigable waterway owned by appellees and others with similar rights and granted a permanent injunction. On appeal, the Third District Court of Appeals reversed the decision. A riparian owner does not have a vested right to unobstructed navigation, but merely enjoys this right in common with the public. The eminent domain statutes protect only private rights, and plaintiff has only a public right. (R. F. Williams-Fla)
W69-00475

ROY, INC V BOARD OF COMM'RS FOR PONTCHARTRAIN LEVEE DISTRICT (MEASURE OF DAMAGES FOR TAKING OF LAND ABOVE MEAN HIGH WATER MARK).

117 So 2d 60-63 (La 1960).

Descriptors: *Judicial decisions, Louisiana, Lakes, *Lake shores, Tides, *Eminent domain, Condemnation, Levees.
Identifiers: Damages (Legal aspects).

Plaintiff landowner brought an action for damages for the taking of his property by a levee district. The trial court found that the land was above the mean high water mark of the lake upon which it bordered, and awarded damages based upon the fair market value of the land at the time of the taking, plus interest from the date of judicial demand for damages (8 years after the taking). Plaintiff appealed, contending in the alternative that the damages should be the fair market value of the land at the time of the suit, or that interest should have been paid from the time of the taking of the property. The court found that the evidence sustained a finding that the land was above the mean high water mark and therefore subject to private ownership. Where a landowner has knowledge of a taking and stands by without complaint, the damages should be the fair market value of the land at the time of the taking. Pursuant to a statute stating that interest becomes payable from the time a debt comes due, the court held that interest should be paid from the date of the taking. (R. F. Williams-Fla)
W69-00477

JONES V HOGUE (OWNERSHIP OF ALLUVION).

116 So 2d 334-342 (2d Cir Ct App La 1959).

Descriptors: *Judicial decisions, Louisiana, *Accretion (Legal aspects), *Boundaries (Property), Legislation, Riparian rights, Rivers, Banks, Riparian land.

Plaintiffs sought a declaratory judgement apportioning alluvion formed in front of their land and the land of the defendants, adjoining riparian owners. The alluvion was formed over many years and was reflected in five Corps of Engineers' hydrographic surveys. The trial judge interpreted the pertinent statute to require that the alluvion be apportioned at the time of its formation, based on the entire area of the alluvion and entered judgment accordingly. On appeal by plaintiffs, the Second Circuit Court of Appeal of Louisiana reversed the trial court. The court stated that the lower court should merely accept the extent and area of the deposit at the time apportionment is sought. Next, the court held that pursuant to the statute, each riparian owner was to own the same proportion of the new front line or river bank as he had on the old river bank. The point on the new river bank reflecting each owner's proportionate share should simply be connected with the point on the old river bank which marked his property line. (R. F. Williams-Fla)
W69-00478

MENTOR HARBOR YACHTING CLUB V MENTOR LAGOONS, INC (NAVIGABILITY).
170 Ohio St 193; 163 N E 2d 373-378 (1959).

Descriptors: *Judicial decisions, Ohio, *Navigable waters, Recreation, Sand bars, Artificial watercourses, Freshwater marshes, Boating, Natural streams.

An adjacent land owner to an improved channel sought to enjoin owners of land adjacent to lagoons which were connected to Lake Erie by the channel from using the channel. The Supreme Court of Ohio, reversing, found for the defendants that the

watercourse in its present state, including both the channel and the lagoons, were navigable and public waters. The court considered the capacity for boating in natural condition, the capacity for boating after the making of reasonable improvements, and accessibility by public termini. Under Ohio case law navigation for pleasure and recreation is as important to the law as navigation for commercial purposes and a natural temporary obstruction to navigation, in the form of a sand bar, does not destroy the otherwise navigable characters of a watercourse. (MacMillan-Fla)
W69-00481

TOWN OF HEMPSTEAD V LITTLE (RIPARIAN RIGHTS BY ACCRETION).
239 N E 2d 722-725 N Y 1968).

Descriptors: New York, Judicial decisions, *Riparian rights, Boundaries (Property), Boundary disputes, Eminent domain, *Ownership of beds, Riparian land, Water law, *Accretion (Legal aspects).

The issue is whether the Town of Hempstead was a riparian owner entitled to the benefit of the land under water as it accreted and became a part of existing upland owned by the town, or whether Little, the party having title to the land formerly under water, retained title notwithstanding such accretion. The court declared the law on the question to be as follows: Gradual encroachment results in a loss to the riparian owner; but when the land is increased by accretion, i.e., by such a slow and gradual deposit of particles that its progress cannot always be measured even though its results may be discerned from time to time--the new land thus formed belongs to the owner of the upland to which it attaches. Applying this rule to the facts of the instant use, the court concluded that when Little's riparian property was condemned several years before this action was brought, Little retaining only fee to the submerged lands, the town acquired littoral rights including the right to the accretion formed. When the accretions covered Little's submerged lands, they became the property of the town. (Patterson-Fla)
W69-00484

DUMONT V SPEERS (REFUSAL TO AUTHORIZE FISHWAY UPHELD).
245 A 2d 151-155 (Me 1968).

Descriptors: Maine, *Administrative decisions, Legislation, Judicial decisions, *Fish passages, Administrative agencies.
Identifiers: *Public nuisance.

Chapter 331 of the Maine Public Laws of 1929 gives power over the supervision, administration and enforcement of inland game and fish laws to a single commissioner, who has power to require a fishway in a dam when he determines it expedient. Pursuant to Chapter 386 of the Public Laws of 1965, which gives the right to initiate a hearing to determine the expediency of a fishway in a dam to, among others, '200 citizens,' petitioners sought to require the Commissioner of Inland Fisheries and Game to require a fishway in a dam. The court sustained a dismissal of the petition on the ground, that, inter alia, the Commissioner's power to require a fishway is permissive, not mandatory. The legislation does not give petitioners de jure a claim for a fishway in the dam. Since there was legislative authority for the dam as it existed, the rule that obstructions to navigation and the passage of fish in navigable rivers or to the passage of boats, logs, and rafts in 'floatable' streams are public nuisances per se does not apply. (Patterson-Fla)
W69-00485

MEHENE V BALL (COMMON RIGHTS TO BEACH USE).

194 NYS 2d 28-32 (1959).

Descriptors: *Judicial decisions, New York, *Easements, Beaches, Lake Ontario, Recreation.
Identifiers: Tax deed.

This case involved a subdivision which bordered on Lake Ontario. A map which had been filed showing an undivided strip of land along the beach. Plaintiff purchased lots in the subdivision and constructed a permanent dock extending into the lake from the undivided strip (not owned by plaintiff). Defendant purchased a lot adjacent to the undivided strip, and purchased the land between her lot and the water from the county. The county had acquired title to the entire strip in a tax sale. Defendant graded the end of one of the subdivision's streets to improve her access to her lot and remove the part of plaintiff's dock on the land she acquired from the county. Plaintiff brought suit to establish his rights in the strip and street and to compel defendant to return the street and dock to their original condition. The court found that the beach was intended for the enjoyment of all the owners in the subdivision and that such was an easement not cut off by a tax deed. Damages sustained by plaintiff were readily ascertainable so the court refused to issue an injunction. (R. F. Williams-Fla)
W69-00488

LONG ISLAND LIGHTING CO V PEOPLE (OWNERSHIP OF ALLUVION).

196 NYS 2d 756-758 (1960).

Descriptors: *Judicial decisions, New York, State jurisdiction, *Accretion (Legal aspects), Breakwaters, *Riparian land, Beds.

Plaintiff was an owner of waterfront property on Long Island Sound. Its predecessor in title had acquired certain underwater lands by letters patent granted by the State of New York in 1929. As a condition of this grant, the grantee was required to construct certain breakwaters and dredge a channel. This was completed by 1934. Since the construction of the breakwaters, a change has come over the littoral land on either side of them. To the east, 12.25 acres of previously submerged land was exposed, and this controversy centered around this alluvion. Plaintiff submitted exhibits and an affidavit which showed that the increase of land was gradual over the past 25 years. Defendant submitted nothing to contradict plaintiff's evidence, and the court granted plaintiff's motion for summary judgment. Where accretion takes place, such gradual additions to the land belong to the littoral owner and not to the state. (R. F. Williams-Fla)

COAST GUARD REGULATIONS, POWERS, AND NAVIGABLE WATERS.

Navigation and Navigable Waters, 33 USCA secs 2.01-1 - 2.99-270 (1968).

Descriptors: *Navigable waters, *Coast Guard regulations, *Administrative decisions, Administrative agencies, Legal aspects, Watercourses (Legal), *Jurisdiction.
Identifiers: *Coast Guard, Coast Guard jurisdiction.

Chapter 1. Navigable waters generally, is a part of Title 3 USCA, dealing with navigation and navigable waters. Subpart 2, with which this abstract is concerned, deals with regulations concerning general duties and jurisdiction. The scope of Subpart 2 includes rules and regulations which are statements of policy, interpretive rulings, or descriptions of practices with respect to the general duties and jurisdiction of the U S Coast Guard in the administration and enforcement of navigation and vessel inspection laws. The primary duties of the Coast Guard assigned by law and its law enforcement powers are set forth. The terms 'high seas,' 'navigable waters,' 'waters subject to the jurisdiction of the U S,' and 'state waters' are defined as they are used in statutes. The availability of Coast Guard and other administrative determinations as to navigability and other matters is described. Finally, internal waters of the U S that have been the subject of Coast Guard determinations of navigability are listed. (Patterson-Fla)
W69-00497

NAVIGABLE WATERS GENERALLY.

33 USCA Secs 1-59a.

Descriptors: *Regulation, *Legislation, *Navigable waters, *Non-navigable waters, Canals, Navigation, Interstate compacts.
Identifiers: *Secretary of the Army, Water gauges, Boundary water.

Section 1 establishes the duty of the Secretary of the Army to prescribe regulations for the use, administration and navigation of the navigable waters of the United States. Penalties for the violation of such regulations are set forth. The Secretary is empowered in sections 2 and 3 to regulate parts of the Mississippi River and waters used for military target practice. Section 4 authorizes the Secretary to establish water gauges on the Mississippi River and its tributaries, section 5 abolished tolls on governmental canals, canalized rivers, etc, and sections 6-10 deal with tolls and public use on various waterbodies. Section 11 authorizes the Middle Northwest States to compact as to jurisdiction of offenses committed on boundary waters. Sections 21-59a set forth various bodies of water declared by Congress to be non-navigable. (Patterson-Fla)
W69-00498

NIAGARA POWER PROJECT.

16 USCA Secs 836-836 (a) (1964).

Descriptors: *Federal Power Act, Electric power, Transmission lines, *Hydroelectric project licensing, New York, *Electric power rates, Project purposes, State governments, Power marketing, Scenic highways, Transmission (Electrical).
Identifiers: Niagara Power Project, Niagara River, New York State Power Authority.

The New York State Power Authority was authorized to receive a license from the Federal Power Commission for the construction and operation of a power project on the Niagara River. The license included conditions required by the Federal Power Act, as well as seven specific conditions for this particular project. These specific conditions require the licensee to give preference to public bodies and non-profit corporations within economic transmission distance in disposing of 50% of the project's power. Neighboring states would also be included in this preference. A percentage of the ramaining project power was required to be sold to the licensee of Federal Power Commission Project 16. Notes of decisions are included and updated by annual supplements. (Geraghty-Fla)
W69-00501

WATER CONSERVATION.

16 USCA Secs 590r-590z-11 (1964).

Descriptors: *Water conservation, *Water policy, *Water supply, *Water storage, Water users, Repayment contracts, Irrigation, Dams, Administrative agencies, Irrigation programs, Farms, Cost allocation, Programs, Projects, Federal government, Water utilization.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Chapter 3c of 16 USCA is divided into two subheadings. The first deals with facilities for water storage and utilization and the second with conservation and utilization projects. The first subheading authorizes the Secretary of Agriculture to formulate and keep current a program of projects for the construction and maintenance of ponds, reservoirs, wells, check dams, pumping installations, and other facilities for water storage or utilization. The Secretary is also authorized to make loans for the purpose of financing the improvement of farm land and to set up an efficient program whereby the government insures loans made for that purpose by other lenders. The second subheading authorizes the Secretary to investigate and construct water conservation and utilization projects in the Great Plains and arid and semiarid areas of the United States and to operate and maintain each project. The statute sets prerequisites which must be met before construction commences, provides for the utilization of services, materials and funds from sources outside the department. The repayment of projects by the water users is provided for in the act. (Horner-Fla)
W69-00502

FACILITIES FOR WATER STORAGE AND UTILIZATION.
16 USCA Secs 590r-590x-4.

Descriptors: *Water conservation, *Water policy, *Water supply, Water utilization, Irrigation, Administrative agencies, Federal government, Farms, Programs, Projects.

Sections 590r through 590x-4 of Title 16 USCA deal with facilities for water storage and utilization. The legislature cites the need for adequate facilities in upholding the national welfare. The Secretary of Agriculture may formulate a program of projects for construction and maintenance of facilities, construct and sell or lease the facilities, co-operate with and aid any agency or person and to acquire lands when necessary. Before extending benefits, the Secretary may require the enactment of State and local laws providing for conservation, the execution of agreements in regard to the maintenance and use of facilities, and contributions to operations conferring benefits. The Secretary may makes loans of federal money for the improvement of farm land or to insure loans made from other sources. The statute outlines a program for the execution, insurance and sale of loans. (Horner-Fla)
W69-00503

WATER CONSERVATION AND UTILIZATION PROJECTS.
16 USCA Secs 590y-590z-11.

Descriptors: *Water conservation, *Water policy, *Water supply, *Water storage, Water users, Repayment contracts, Water utilization, Dams, Irrigation programs, Farms, Federal government, Programs, Projects.

Sections 590y through 590z-11 of Title 16 USCA deal with conservation and utilization projects. For the purpose of stabilizing water supply and thereby rehabilitating farmers on the land and providing opportunities for settlement of farm families, the Secretary of the Interior may investigate and construct water conservation and utilization projects in the Great Plains and arid or semiarid areas of the country and operate and maintain each project. The statute outlines factors to be investigated and provides for the utilization of services, materials and funds of Federal, State, or municipal agencies or individuals in connection with the investigation, construction, or operation and maintenance of a project. No water may be delivered until repayment contracts have been executed by water users organizations or individual landowners. The statute sets certain provisions that must be contained in the contracts. The Secretary of Agriculture is authorized to arrange the settlement of the projects, to advise settlers, to acquire agricultural lands, and to arrange for the improvement of lands within project boundaries. Provisions may be made in connection with any project undertaken, for furnishing municipal water supplies or for developing and furnishing power. (Horner-Fla)
W69-00504

ACQUISITION OF LANDS OR INTERESTS THEREIN FOR USE IN GAGING STREAMS OR UNDERGROUND WATER RESOURCES.
43 USCA Sec 36b.

Descriptors: *Legislation, *Streams, Subsurface waters, Federal government, Gaging stations, Observation wells, Geological surveys, Underground streams, Water resources, Condemnation, State governments, Federal-state water rights conflicts, Irrigation water, Interstate rivers, Water rights, Right-of-way, Easements, Permits, Leases.
Identifiers: *Secretary of the Interior, Territorial Governments, Congressional appropriations, *Acquisition of lands.

Section 36b authorizes the Secretary of the Interior to acquire lands on behalf of the United States for use by the Geological Survey in gaging streams and underground water resources, not in excess of ten acres for any one stream gaging station or observation well site. For the same purpose the Secretary may obtain easements, licenses, rights-of-way, and leases limited to run for such time as may be required for effectively gaging streams and underground water resources. Nothing in the section is to be construed to affect or in any way interfere with the laws of any State or Territory relating to control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder. The Secretary, in carrying out the provisions of this section, is to proceed in conformity with such laws. Nothing in this section in any way affects any right of any State or of the Federal Government or of any landowner in, to, or from any interstate stream or its waters. (Smodish-Fla)
W69-00508

BEACH AND SHORE PRESERVATION ACT.

Fla Stat Secs 161.011-161.45 (1967).

Descriptors: *Florida, *Legislation, State governments, Local governments, Beach erosion, Sands, Shores, Coasts, *Shore protection, Coastal structures, Jetties, Breakwaters, Beaches, Federal government, Cost sharing, Permits.

The Beach and Shore Preservation Act is divided into two parts. Part one regulates the construction, reconstruction, or other physical activity undertaken specifically for shore protection purposes. This regulation is accomplished by requiring that a permit be obtained from the State Board of Conservation prior to the commencement of such work if it will affect the sovereign lands of Florida below the mean high water line of any tidal water of the state. Part two provides for the division of the state into beach and shore preservation districts and includes the grant of a general power of authority to the administrators to effectively carry out the purpose of this chapter. The Board of county commissioners of any county and its successors in office, as an ex officio duty, are designated as the beach and shore preservation authority for their county. The chapter contains 31 sections and is quite detailed in its enumeration of authority and duties. (R. Smith-Fla)
W69-00511

EFFECT UPON OWNERSHIP AND TAXABILITY OF LANDS - AFFECTED BY ACCRETION, EROSION OR AVULSION.
Rep Att'y Gen Fla, 063-50, May 20, 1963.

Descriptors: *Florida, *Avulsion, Erosion, Riparian rights, Riparian land, Local governments, State governments, *Beach erosion, Bank stability, Coastal engineering, Water law, Ownership of beds, Boundaries (Property), Oceans, Coast, Shores, Beaches.

In reply to certain questions posed, the Attorney General stated that the status of the fee title of an area which formerly was upland, but which now consists of submerged lands, is determined by the manner in which the land became submerged. The Florida courts have adopted the legal principle that where the upland is lost by reason of avulsion and the effect is perceptible, there is no boundary change. If the property was lost by a slow and imperceptible process there would be a boundary change and the title to the submerged area would be vested in the state. Since the land in question has become submerged through both erosion and avulsion, the city, in its efforts to regain beaches through the construction of groins, cannot extinguish the riparian rights of the upland owners affected by such works, and thus it should not undertake such a project until those private upland owners have consented to such a program. (Smith-Fla)

RIPARIAN RIGHTS AND DUTIES,
Vincent Powell-Smith.
The Law J, Vol 115 (NS), No 5171, pp 155-157, March 5, 1965. 3 p, 3 ref.

Descriptors: Water law, *Riparian rights, Artificial watercourses, Reasonable use, *Natural streams, Civil law, *Repulsion (Legal aspects), Percolating water, Surface drainage, Industries, Damages.
Identifiers: *United Kingdom, Common law.

A succinct summary of English water law respecting riparian rights and duties is presented, including case citations and references to Roman and civil law influences. Rights of extraction and use are part and parcel of the natural incidents of ownership. The question of industrial use as an ordinary and reasonable use remains undecided. The landowner is under no common law duty to do anything to correct a natural stream flowing through his land that becomes obstructed by natural causes; however, actions in nuisance, negligence and strict liability may lie in cases where injury stems from nonnatural causes. (MacMillan-Fla)

MCGIBNEY V WAUCOMA YACHT CLUB INC (DOCKS - RIPARIAN LAND).

182 A 2d 622-625 (S Ct Err Conn 1962).

Descriptors: *Connecticut, Navigable waters, Riparian rights, *Docks, Marinas, Littoral, *Riparian land, Rivers, Banks, Damages, Water law, Prescriptive rights.

The defendant for about forty years has owned land on the westerly bank of the river, abutting land which the plaintiff, between 1935 and 1952, leased from Ball and which he purchased from Ball in 1952. Continuously since 1935, the plaintiff has operated on this property a restaurant which has increasingly through the years received patronage from rivercraft. In 1955, the plaintiff built a small dock which he extended by adding floats until, by 1960, he had a 'T' dock on the river in front of his property. The defendant has operated a yacht club since 1930. In 1960, the defendant erected a string of floating docks parallel to the shore and about 112 feet out therefrom. Later defendant ran a dock perpendicularly from the shore out to the string of floating docks. The effect of these actions was to block direct access from the main river channel to the plaintiff's property. The court held that even though plaintiff failed to prove facts from which the trial court could assess the monetary amount of his damages, the trial court was entitled to grant injunctive relief against the tortious interference with plaintiff's littoral rights. (R. Smith-Fla)

UNITED STATES V 461.42 ACRES OF LAND (AVULSION AS IT RELATES TO TITLE).
222 F Supp 55-59 (N D Ohio 1963).

Descriptors: Ohio, Judicial decisions, Lake Erie, Dikes, Riparian waters, Riparian land, *Ownership of beds, United States, Condemnation, Eminent domain, *Avulsion, Beds, Storms, *Beach erosion, Waves (Water), Erosion.

This was a proceeding to determine title to land appropriated by the United States. The State of Ohio and defendant claimed title and the United States sought a judicial clarification of title so that payment for the appropriated land might be made. The land in question had been submerged in Lake Erie since 1929, and Ohio claimed title based on a statute which provided that title to land under Lake Erie would be in the State. Defendant claimed title based on the fact that prior to 1929 the land was above water and became submerged by avulsion after a violent storm. There is an Ohio statute which provides that title shall not be lost by avulsion. Ohio claimed that the storm in 1929 was simply a factor aiding in the erosion of the land, and that land lost by erosion will extinguish title. The land was held to have been lost by avulsion and title remained in the defendant. (Crabtree-Fla)

REORGANIZATION PLAN NO 2 OF 1966 (WATER POLLUTION CONTROL).
U. S. Congress, House Committee on Government Operations, 89th Congress, 2nd Session.

Hearings, Subcommittee of the Committee on Government Operations, House of Representatives, 89th Congress, 2nd Session, March 30 and May 4, 1966.

Descriptors: *Legislation, Administrative decisions, *Political aspects, Water resources development, Administrative agencies, *Water pollution control.
Identifiers: Water Pollution Control Acts.

On March 30, 1966 the Subcommittee of Executive and Legislative Reorganization of the Committee on Governmental Operations House of Representatives met to consider Reorganization Plan No 2 of 1966. The subcommittee heard testimony and received additional material for the record. The Plan would amend the Federal Water Pollution Control Act (33 U S C 466). Basically, the Plan would transfer to the Secretary of the Interior the functions delegated to the Department of Health, Education, and Welfare, under the Federal Water Pollution Control Act except for responsibilities relating to public health. The purpose of the reorganization is to unify water pollution control efforts with the related tasks of managing, developing, and conservation, of water resources which are functions of the Department of the Interior. Objections to the Plan included a possible deemphasis on the public health aspect and unnecessary delay in the implimentation of the Federal Water Pollution Control Act. On May 4, 1966, the subcommittee reconvened to consider H Res 827, a resolution of disapproval of Reorganization Plan No 2 of 1966. The subcommittee heard additional testimony. The subcommittee discussed the effects which the reorganization would have on the employment status of the commissioned officers of the Public Health Service. No action was taken on the resolution. RECENT DEVELOPMENTS IN RESOURCES AND UTILITIES LAW,
E. F. Taylor.
AWWA J, Vol 56, No 7, pp 863-880, July 1964. 18 p, 44 ref.

Descriptors: *Water law, *Water supply, *Water resources development, *Project planning, Legislation, Judicial decisions, Legal aspects, Water allocation (Policy), Federal-state water rights conflicts, Interstate compacts, Water rights, Federal government, State government, Water rates.

The major developments in water resource laws and programs are considered in the article. One of the most significant developments was the Supreme Court decision authorizing the Secretary of Interior to exercise previously unparallelled powers over the Colorado River's water supply in times of shortage. The author considers the Secretary's plan for managing the river, along with international water resource control plans such as the Great Lakes Water Resources Plan and the Columbia River Basin Compact, and regional plans such as the Delaware River Basin Compact. The problem of federal-state conflicts is examined and Congressional recommendations and judicial decisions in the area are considered. The author then surveys the recent water rights litigation throughout the country. Various states have passed or are considering water resource development programs and plans. The author considers these and state problems in the utilities area. (Horner-Fla)
W69-00517

AN ACT RELATING TO THE WATER AND AIR ENVIRONMENTAL IMPROVEMENT COMMISSION.
Maine Laws Ch 475 (July 5, 1967).

Descriptors: *Main, Legislation, Air pollution, Rivers, Standards, *Water reservoirs, Grants, Sludge, *Sewage treatment, Hydrogen-ion concentration, Sea waters, *Water pollution, Administrative decisions, Administration, Administrative agencies, Water law.

The Water and Air Environmental Improvement Commission's purpose is to recommend methods of controlling pollution of air, rivers, waters and coastal flats caused by municipal sewage, industrial wastes and other materials detrimental to the public health or public use. The Commission recommends that the legislature raise water quality standards when economically feasible. The Commission can accept federal funds for water pollution, water resources and air pollution control. The Commission has four standards for the classification of fresh surface waters and five standards for the classification of tidal or marine waters. The Act describes these classes and the limits and requirements for the use of each. A schedule for compliance to water standards for users of certain waters of the Penobscot River Basin and Waldo County is provided. Methods for enforcing these standards and procedures for appealing Commission decisions are established. The Commission is also required to make studies relating to the causes and prevention of air pollution. (Childs-Fla)

APPLICATION OF 253.122 F S TO SUBMERGED LANDS OWNED BY ONE OTHER THAN THE ABUTTING UPLAND OWNER,
Richard Ervin.
Rep Att'y Gen Fla 059-191, Sept 25, 1959.

Descriptors: *Florida, Administrative agencies, Adjudication procedure, Administrative decisions, *Beds, Ownership of beds, State governments, Contracts, Jurisdiction, *Legislation, *Bulkhead lines, Permits, Coastal structures, Landfills.

This opinion responded to questions from a trustee of the internal improvement fund involving one's right to fill submerged lands: (1) purchased from one abutting upland owner, or (2) purchased with consent of the abutting upland owner, and (3) such owner's duty to comply with the Bulkhead Law. The trustee also asked if a full record of proceedings setting a bulkhead line was required. The Attorney General replied that even though prior to 1957 an owner of submerged land had a statutory right to bulkhead and fill such lands, and this was a contract right, such contract right could be impaired in persuance of the state's police power. He concluded that the passage of the 1957 Bulkhead Law was an exercise of the police power, that it did impair contract rights, and therefore owners of submerged lands in both cases posed in the questions must comply with the Bulkhead Law, regardless of when they or the persons under whom they claimed acquired the lands. He also stated that a full record of proceedings setting bulkhead lines was necessary. (R. Williams-Fla)

WATER RIGHTS LITIGATION,
Edward F. Taylor.
AWWAJ, Vol 58, No 5, pp 535-554, May 1966. 20 p, 54 ref.

Descriptors: Droughts, Water conservation, Interstate, Water supply, *Delaware River Basin Commission, *Interstate compacts, State governments, Municipal water, *Water permits, Riparian rights, Prior appropriation, Water pollution control, *Long-term planning, Local governments.
Identifiers: Water impasse, Model Water Use Act.

The drought that seized the Northeast in 1965, and which regularly seizes the West, pointed out the need for water laws of national and regional scope but more importantly, for farsighted local plans. The states of New York, New Jersey and Delaware launched long-range attacks on the problem of water supply and conservation through the Delaware Basin Commission. Local government's primary responsibility is to protect and develop water supplies. Determining who has priority is the key in developing comprehensive rules to govern the use of water. The Model Water Use Act is a major aid in water-law revision as it incorporates the most workable provisions of many state and local systems. Western water law is the article's main topic. (Geraghty-Fla)

BASS V FARRELL (TITLE TO ACCRETED LAND).
Arkansas, Little Rock.

370 S W 2d 54-59 (Ark 1963).

Descriptors: Erosion, *Channel erosion, Bank erosion, *Acretion (Legal aspects), Boundaries (Property), Lumber, meanders, Currents (Water), Shores, Riparian land, Maps, Judicial decisions, *Arkansas, Areal.

Involved in this dispute between riparian owners are concepts of erosion and accretion. Defendant was enjoined from cutting timber on land formed by accretion. The appellate court upheld the injunction because the defendant, as the real plaintiff in this suit, did not sustain the burden of recovering on the strength of his own title. The appellate court did not consider defendant's numerous exhibits persuasive of his claim. The apportionment portrayed in the exhibits was untenable. It is common knowledge that a bank is eroded by the pressure of the current against the shoreline. Aerial photographs showed discernable lines of erosion on the upstream site only, indicating that the channel did in fact travel downstream from west to east. This negated defendant's assumption that the accretions in issue were formed as the river moved from the north to the south. (Harriett-Fla)

VILLAGE OF OLD FIELD V SCHUYLER (LICENSE TO DREDGE ON STATE SUBMERGED LAND).
13 N Y 2d, 191 N E 2d 460-464 (1963).

Descriptors: *Dredging, Channel improvement, *Navigation, Navigable waters, Jurisdiction, Federal jurisdiction, State jurisdiction, *Permits, Administrative agencies, Legislation, *New York.

LIBRARY U. OF I. URBANA - CHAMPAIGN

The appellant realty company owned land fronting on Long Island Sound. This included two jetties extending into the Sound, which had been constructed by the predecessor in title persuant to an easement from the State. The appellant sought to dredge between the jetties. This necessitated obtaining a license from the Land Office. The statute requiring the license required Certification by the Army Corp of Engineers that dredging was necessary to improve navigation. Respondent argued an appeal that the State had no authority to issue the license, since certification had not been obtained. The Court of Appeals disagreed. It reasoned that the Corp of Engineers, when issuing the permit to dredge, tacitly understood the purpose to be improvement of navigation. Failure of the permit to specify navigation did not preclude the State from issuing its license. (Harriett-Fla)

BURKART V CITY OF FORT LAUDERDALE (RIPARIAN RIGHTS).
156 So 2d 752-766 (Fla DCA 1963).

Descriptors: *Florida, Judicial decisions, *Riparian rights, Navigable waters, *Accretion (Legal aspects), Land tenure, *Easements, Right-of-way, Public rights, Highways, Access routes.

Owners of lots in a subdivision brought suit against the city of Ft Lauderdale, Florida, to resolve the question of ownership of riparian rights. The lots were bounded by a street that ran along a navigable stream. The court held that where a street was laid out so that it was bounded on one side by navigable waters, dedication of the street to the public operated to relinquish to the public and merge into the public right dedicator's individual right of access to the open navigable waters in front of the dedicator's uplands. Owners of upland were not vested with riparian rights to the exclusion of the riparian rights accruing to the easement for the street even though they owned the underlying fee in the street. The dissent urged that riparian rights should not be treated, as here, as an indivisible package of privileges attached exclusively to the easement, and that plaintiffs should be adjudged owners of the land formed by accretion with such riparian rights and privileges as do not burden the easement according to the purpose of its dedication. (MacMillan-Fla)

STATE V KULUVAR (CHANGE IN CROSS-SECTION OF PUBLIC WATERS).
123 NW 2d 699-707 (Minn 1963).

Descriptors: Permits, Federal jurisdiction, International boundaries, State jurisdiction, Reservation doctrine, Federal-state water rights conflicts, *Legislation, Judicial decisions, *Minnesota.
Identifiers: *Criminal law.

Defendant was convicted for violating a Minnesota criminal statute prohibiting interference with public waters subject to state control without authorization. The Supreme Court of Minnesota rejected two arguments for reversal, but accepted a third. The court rejected first the assertion that there was a conflict between federal and state authority. There was no showing that compliance with the State statute interfered with federal exercise of power over an international boundary. The court also rejected plaintiff's argument that the statute was too uncertain to be constitutional. The court did declare, however, that in order to justify the conviction, it must be established that the use of the waters, past, present, or reasonably likely in the future, has been detrimentally affected by the unlicensed change. Evidence of such detrimental effect was lacking. (Harriett-Fla)

FLOOD CONTROL REGULATIONS.

33 CFR Part 208, Jan 1, 1968.

Descriptors: United States, Cost allocation, Maintenance costs, Project planning, State governments, *Flood control, Flood protection, *Flood routing, Levees, Sand boils, *Dams, Reservoirs, Drainage, Channels, Bank protection, Riprap, Seepage, Right-of-way, *Regulation, Engineering.

Structures constructed by the U S for local flood protection shall be continuously operated and maintained by states or political subdivisions thereof, who furnish assurances that they will do so in accordance with regulations prescribed by the Secretary of the Army and without cost to the U S. They shall appoint permanent committees, headed by 'Superintendants' who will be responsible for the operation, maintenance and inspection of such facilities. Before improvements or repairs of project works are undertaken, a superintendant must contact the District Engineer of the Dept of the Army. The superintendant must also submit semi-annual reports to the District Engineer. Maintenance and operation procedures are outlined to insure the serviceability of levees, drainage structures, pumping plants, channels, floodways and other flood control facilities. The Upper Potomac River Commission is responsible for the operation of the Savage River Dam and Reservoir. Operating instructions are detailed in the chapter, including a Storage Reservation Diagram. Responsibility for the operation of the Alpine Dam and Reservoir, the Bear Creek Dam and Reservoir and the Weiss Dam and Reservoir are also described in detail. Much of the chapter deals with the operation of dams and reservoirs in western states, notably California. The publication is kept up to date by annual supplements. (Geraghty-Fla)

FLORIDA AIR AND WATER POLLUTION CONTROL COMMISSION - POLLUTION OF WATERS.
Fla Admin Code, Ch 285, Secs 28-5.01 to 28-5.21.

Descriptors: Permits, *Florida, *Legislation, Administrative agencies, State jurisdiction, Water law, State governments, *Water pollution treatment, Water pollution control, Water quality control, Pollution abatement, *Drainage wells, Water pollution, Water quality, Industrial wastes, Municipal wastes, Standards.

The rules included in this chapter deal with the pollution of waters within the territorial limits of the State of Florida. The rules enumerate the standards of water quality desired and provide for the testing procedures to be used to insure compliance with the standards. The waters of the state are divided into five classifications and detailed criteria are provided for ascertaining the degree of purity required of each class. The rules state it is the intent of the State of Florida to review Class V stream classifications periodically and as water quality improves, hearings will be held and reclassification shall be established. The rules also provide for the regulation of drainage wells. (R. Smith-Fla)
W69-00528

FLORIDA AIR AND WATER POLLUTION CONTROL COMMISSION - POLLUTION OF WATERS.
Fla Admin Code, Ch 285, Secs 28-5.01 to 28-5.04.

Descriptors: Permits, *Florida, *Legislation, Administrative agencies, State jurisdiction, Water law, State governments, *Water pollution treatment, Water pollution control, Water quality control, Pollution abatement, Water pollution, Water quality, Industrial wastes, Municipal wastes, Standards.

The following minimum conditions are applicable to all Florida waters, at all places and at all times. Within the territorial limits of this state all such waters shall be free from: (1) settleable substances, (2) floating substances, (3) deleterious substances, and (4) toxic substances. Tests or analytical procedures to determine compliance or noncompliance with water quality criteria provided by this chapter shall be in accordance with methods given in the latest edition of Standard Methods for the Examination of Water and Wastewater. All industrial wastes or other wastes shall be effectively treated by the latest modern technological advances as approved by the regulatory agency. All discharges from municipal and privately owned domestic waste plants will comply with the Water Quality Standards of the State of Florida with 90% treatment or better as expeditiously as possible, but not later than Jan 1, 1973. (R. Smith-Fla)
W69-00529

FLORIDA AIR AND WATER POLLUTION CONTROL COMMISSION - POLLUTION OF WATERS.
Fla Admin Code, Ch 285, Secs 28-5.05 to 28-5.21.

Descriptors: Permits, *Florida, *Legislation, Administrative agencies, State jurisdiction, Water law, State governments, *Water pollution treatment, Water pollution control, Water quality control, Pollution abatement, *Drainage wells, Water pollution, Water quality, Industrial wastes, Municipal wastes, Standards.

The rules also set 21 quality control standards to provide the criteria for determining the degree of pollution. The waters of Fla are classified according to their usage as follows: (1) Class I - public water supplies; (2) Class II - shellfish harvesting; (3) Class III - recreation and the propagation and management of fish and wildlife; (4) Class IV - agricultural and industrial water supply; and (5) Class V - navigation, utility and industrial use. The above classifications are discussed in detail as to the criteria of each and the classifications are reviewed periodically. The rules also provide for the regulation of drainage wells. Before any municipal or private corporation or persons shall use an existing drainage well or drill a new well for the discharge of surface water or sewage, it must apply to the Commission for a written permit authorizing the drilling and use of said well. (R. Smith-Fla)
W69-00530

REGULATION OF THE DEVELOPMENT OF WATER POWER AND RESOURCES.
16 USCA Secs 791-797 (1968).

Descriptors: *United States, *Legislation, *Federal Power Act, Public lands, Reservation, City, Navigable waters, Projects, *Water resources, Permits, Hydroelectric project licensing, Reservoirs.
Identifiers: Federal Power Commission, Powersites.

This act establishes the Federal Power Commission. The composition of commission and the restrictions placed on commissioners are detailed. The Commission employs a chief engineer and other officers. Public lands, reservations, corporations, person, state, municipality, navigable waters, municipal purposes, government dam, project, project works, commission, state commission and security are defined. The Commission's general powers are: (1) investigations and data collection on water resources, the water-power industry, power sites and power from government dams: (2) statements of license investment in projects; (3) cooperation with the executive department; (4) publication of information and reporting to Congress; (5) license issuance for construction of dams, reservoirs, etc.; (6) issuing preliminary permits; (7) investigating occupancies developing power. Preliminary permits are not transferable and are subject to cancellation. Licenses are valid for fifty years. The controls over permits are explained. There are limitations on license transfer. (Childs-Fla)
W69-00531

REGULATION OF THE DEVELOPMENT OF WATER POWER AND RESOURCES.

16 USCA Secs 798-806 (1968).

Descriptors: *United States, *Federal Power Act, Legislation, Navigation, Right-of-way, Sluices, Locks, Dams, *Navigable waters, Monoply, Channel, Projects, Permits.
Identifiers: Amortization reserves, Public use.

Conditions imposed on FPC license include: (1) the project adopted must be the best for developing a waterway for public use; (2) alteration of the approved project is allowed only in emergencies; (3) the project must be maintained; (4) amortization reserves must be maintained; (5) reimbursement is to be paid by a benefited licensee; (6) other consistent conditions may be required; (7) monopolistic combinations are prohibited; (8) certain of these conditions may be waived. Project work affecting navigable waters may have additional conditions included in their license: (1) if the project is a dam then the construction of locks, booms, sluices, etc, may be required; (2) if these are not to be constructed by the licensee, then the right of way is to be given to the United States; (3) the licensee is required to furnish the power for these structures. If navigation requires additional construction but the cost is unreasonable, then the commission will request Congress to participate. The licensee must commence construction within two years from licensing and proceed with due faith and diligence. The Attorney General may act to secure a license revocation and the sale of unfinished works. (Childs-Fla)
W69-00532

REGULATION OF THE DEVELOPMENT OF WATER POWER AND RESOURCES.

16 USCA Secs 807-823 (1968).

Descriptors: *United States, Legislation, *Federal Power Act, *Permits, Compensation, Coast Guard Regulations, State regulation, *Rates, Channel, Eminent domain, Navigable waters, Public lands, Reservations.
Identifiers: National safety, Secretary of the Army, Navigational facilities, Public service licensees.

When an FPC license expires, the Government may acquire the works upon payment of compensation equal to the net investment. Licenses may be renewed. The Government may use projects when necessary for the national safety and upon payment of compensation. Provision is made for disposing of charges arising from licenses. The Coast Guard may direct the maintenance of lights and signals. The Secretary of the Army regulates navigational facilities. Penalties are prescribed for non-compliance. All public-service licensees must abide by state regulation, unreasonable, discriminatory and unjust rates are prohibited for interstate power. When property is necessary for the public interest to develop a waterway, it may be acquired through eminent domain. Rights vesting prior to June 10, 1920 are not affected. It is unlawful to maintain works affecting navigable waters, public lands, reservations or use surplus water or water power from a Government dam except under certain conditions. A license is required for works affecting interstate or foreign commerce. The Attorney General may act to prevent license violations. This chapter does not affect state law relating to water used for irrigation or other purposes. This act is annotated and supplemented. (Childs-Fla)
W69-00533

BODICK V HARCLIFF MINING CO (OBSTRUCTION TO STREAMFLOW BY MINING WASTES).

208 Pa Super 471, 222 A 2d 615 (1966).

Descriptors: *Pennsylvania, Remedies, Adjudication procedure, *Flood damage, *River flow, *Obstruction to flow, Ice jams.

A trespass action was brought for damages to plaintiff's house, located 300 feet from the edge of the Allegheny River. Plaintiff alleged that debris from defendant's strip mine, consisting of the remains of a spoil wall which had slid into the river channel approximately 1/2 mile downstream, interfered with the normal flow of the river causing an ice jam, unusually high flood waters, and the resultant damage to his home. After verdict for plaintiff, defendant moved for judgment N O V and for a new trial, both of which were denied. This Court affirmed, holding that whether the debris interfered with the normal flow of the river was a jury issue. There was sufficient evidence of proximate cause to submit the matter to the jury. Defendant's negligence may be the proximate cause of an injury where it is a substantial factor in bringing about the injury or when it concurs with an act of nature and defendant cannot show that the injury would have occurred independently of his negligence. (Kahle-Fla)
W69-00534

KNIGHT V CIARLONE (INTERFERENCE WITH LITTORAL RIGHTS).
200 NYS 2d 805-807 (1959).

Descriptors: *Judicial decisions, *New York, *Riparian land, Riparian rights, Docks, *Easements.
Identifiers: Injunctions.

Defendants had an easement over plaintiffs property for the purpose of gaining access to a lake upon which plaintiff was a littoral owner. Defendants constructed a dock extending into the lake from plaintiff's property. Plaintiff brought suit to compel defendants to remove the dock. The Chancellor stated that a littoral owner on a lake has not only title to the low-water mark of the lake, but as an appurtenance or easement thereto, he has a right of access to and from the lake waters and to build such docks as will not interfere with navigation. The Chancellor held that defendant's easement did not include the right to construct a dock and that such construction interfered with plaintiffs' littoral rights. The injunction was granted. (R. Williams-Fla)
W69-00535

STEBBINS V ORANGEBURG MFG CO (STREAM POLLUTION).

10 App Div 2d 859; 199 NYS 2d 124-125 (1960).

Descriptors: *New York, Judicial decisions, Streams, *Damages, Pollution abatement, *Water pollution, Chemical precipitation, Waste treatment, Riparian rights.

Plaintiff property owner sought an injunction and damages for pollution of a creek adjacent to his property by defendant's discharge of industrial wastes. The New York Supreme Court, Appellate Division, held that evidence sustained finding that industrial waste discharged by defendant caused the creek to be below the standard of purity required by water pollution control board and caused emission of chemical odor constituting a nuisance and entitling owner to damages. Denial of the injunction was proper because of the installment by the defendant of a chemical treatment plant. (MacMillan-Fla)
W69-00536

RANDLE V CITY OF ROME (MUNICIPAL LIABILITY FOR STORM DRAINS).
195 NYS 2d 373-376 (1960).

Descriptors: *Judicial decisions, *New York, *Cities, Drains, Surface runoff, Surface drainage, *Storm drains, Obstruction to flow, Water injury, Floods.

Plaintiff property owner brought an action against the city, alleging negligence in its operation of storm drains, resulting in the backing up of water in the street and on plaintiff's property. The city moved to dismiss the complaint. The court held that notice of a defective condition did not have to be given to the city under such a provision in its charter, where the city creates a dangerous condition through its active negligence. The judge summarized New York on municipal liability for water damage and concluded that where a city has undertaken to provide a drainage system, negligence in the operation and repair of such system will render the municipality liable for damages. The court held that the plaintiff's complaint stated a cause of action and denied the city's motion to dismiss. (R. Williams-Fla)
W69-00537

FAIRCHILD V KRAEMER (PUBLIC RIGHTS IN TIDAL MARSHES).
193 NYS 2d 512-514 (1959).

Descriptors: *Judicial decisions, *New York, *Navigation, *Tidal marshes, Easements, Ownership of beds, Tidal waters, Harbors.

Plaintiff held title to part of a sound, which had consisted, prior to 1893, of sand ridges, salt marshes and tidal creeks. Around 1893 the area was dredged so as to become a deep, commonly used harbor for pleasure craft. In 1959, plaintiff hired a watchman and challenged those who wished to enter the harbor. He brought an action of trespass against defendant, claiming title to the bottom of the harbor because it was man-made. The court held that the area was always subject to the public's navigation rights since tidal creeks opened into the sound. Generally all salt waters where the tide ebbs and flows are navigable in law, giving rise to a right of navigation vested in all the people. This is true even though the tidal creeks may not be actually navigable at low tide. Judgment was rendered for defendant. (R. Williams-Fla)
W69-00538

SMITH V PEOPLE (LANDS APPROPRIATED FOR STATE RESERVOIR).
193 NYS 2d 127-130 (App Div 1959).

Descriptors: *Judicial decisions, *New York, State governments, *Reservoirs, Islands, Eminent domain, Compensation, Condemnation, *Maps.
Identifiers: Adverse possession.

Plaintiff brought an action to quiet title to part of an island in a state reservoir. Plaintiff contended that the strip of land which connected the island to the mainland was covered by water only in the spring. Thus the strip was a peninsula and not part of the land appropriated by the state for the reservoir. The map filed when the award was made to plaintiff's predecessor in title showed the land as included in the appropriation. A New York Statute provided that such award maps are presumptive evidence of state ownership. The Supreme Court, Appellate Division, affirming a judgment for the State by the trial court, held that plaintiff had not overcome the presumption of state ownership. The court additionally held that since the state constitution forbade the disposal of any canal lands unless no longer in use and because these lands were held in trust for the public, the state could not have alienated them. Plaintiff's claim to title through adverse possession was barred. Alienability is a prerequisite for operation of adverse possession. (R. Williams-Fla)

MARANDOLA V BEAUREGARD (FLOODING OF LOWER LAND).

158 A 2d 876-877 (R I 1960).

Descriptors: *Judicial decisions, *Rhode Island, *Floods, Streams, Obstruction to flow, Water injury, *Pipes.
Identifiers: Evidence.

Complainants owned land below that of respondents. A natural watercourse had flowed from time

LIBRARY U. OF I. URBANA - CHAMPAIGN

immemorial from a pond on respondents' land across complainants' land. Complainants filled in their land and enclosed the watercourse in a pipe, which had a bend in it and which did not follow the natural course of the book. This pipe became blocked and flooding of complainants' land and a town highway resulted. Complainants contended that the respondents caused this flooding by deepening the drainage ditch from the pond and filling in such pond. Complainants brought suit to enjoin respondents from further excess discharge and to recover for damages already suffered. The trial court found that the complainants had been the cause of the flooding, and dismissed the bill. The Rhode Island Supreme Court affirmed. (Williams-Fla)

ALLEN V MORRIS BUILDING CO (SURFACE RUNOFF DAMAGE).

360 Mich 214; 103 NW 2d 491-493 (1960).

Descriptors: *Michigan, Judicial decisions, Surface waters, Surface runoff, *Repulsion (Legal aspects), *Riddance (Legal aspects), Drainage water, Damages.

Homeowners in Michigan sued a building company and its majority stockholder and president for damages caused by water flowing onto their land as a result of grading and construction. The supreme court held that the fact that defendants willfully graded and built downspouts causing waters in excess of natural flowage to be channeled onto plaintiffs' property causing damage was enough to warrant recovery without negligence or violation of city ordinance. Plaintiffs were not required to raise the grade of their lot to mitigate damages. Where an individual, who is majority stockholder, president and in control of defendant corporation's activities personally supervised such grading and construction, he participates in the tort and is personally liable with the corporate defendant. (MacMillan-Fla)
W69-00541

REKEDALL V COUNTY OF REDWOOD (DITCHES).
102 NW 2d 682-689 (Minn 1960).

Descriptors: *Minnesota, *Ditches, Legislation, State governments, Drainage, *Assessments, Benefits, Compensation.

The petitioners sought to use Judicial Ditch No 33 as an outlet for the proposed Judicial Ditch No 32. The district court granted authority and fixed the benefit to Judicial Ditch No 32 at $12,500. The property owners who had been assessed to pay for No 33 sought appeal from the order claiming that the $12,500 only paid for actual changes to No 33 to enable No 32 to use it and it did not include any of the cost of the original construction of number 33. The Supreme Court held that the district court and not a jury had the power under MSA 106.531, to fix the terms and conditions for the use of a ditch as an outlet. The court held that the landowners were not an aggrieved party entitled to appeal the court decision under MSA 106.631. That section only provided for appeal when benefits were assessed upon landowners for the construction of a ditch. That was not the case here since the landowners were not being assessed. (Horner-Fla)
W69-00542

ESSOCK V TOWN OF COLD SPRING (DRAINAGE DITCH).
10 Wis 2d 98; 102 N W 2d 110-114 (1960).

Descriptors: *Drainage, *Ditches, *Assessments, Legislation, Local governments, Legal aspects, Wisconsin.

The plaintiff landowner brought action to set aside a special assessment made upon his land for cleaning out a drainage ditch contiguous to the land. The court held that the town board complied with the statute outliving procedures on complaint of obstruction and the statute outliving the manner of apportionment of assessments. The board's action was not arbitrary or unreasonable and its determination is conclusive. (Horner-Fla)
W69-00543

FLYNN V BEISEL (RIPARIAN RIGHTS).
102 N W 2d NW 2d 284-293 (Minn 1960).

Descriptors: *Riparian rights, *Easements, *Riparian land, Navigable waters, Ownership of beds, Boundaries (Property), Real property, Water law, Legal aspects.

The plaintiff sought to enjoin the defendants from erecting a dock at the termination of a public easement abutting on a navigable lake. The plaintiff admitted that the public has easement rights of ingress to and egress from the lake but alleges that the rights are restricted to travel only and not to use of navigable waters beyond the water's edge. The court held that the roadway to the lake had been established by common law dedication and therefore the public had the same riparian rights as any riparian owner. Riparian rights are an incident of ownership of the shore and not ownership of the bed of a lake. Riparian owners have a right to make use of a lake over its entire surface, in common with all other abutting owners, provided such use is reasonable and does not interfere with the rights of abutting owners. (Horner-Fla)
W69-00544

OAKLAND CLUB V CITY OF SOUTH EUCLID (SURFACE RUNOFF).
165 NE 2d 699-703 (Ohio Ct App 1960).

Descriptors: Municipalities, Drainage systems, Water law, Repulsion (Legal aspects), *Controlled drainage, Drainage, Drainage water, Large watersheds, Judicial decisions, Riparian waters, *Storm drains, Storm runoff, Surface runoff, *Surface drainage, *Ohio, Sewers, Reasonable use, Running waters, Surface water, Diffused surface water.
Identifiers: Capacity of the stream rule, Civil law rule.

Plaintiff maintained a golf course for the use of its members. A natural watercourse flowed through that land serving to drain surface water accumulating in the general area. Taking advantage of this natural watershed area and several small tributaries that ran into the watercourse, defendant municipality constructed a stormwater sewage system to collect and dispurse surface water from municipal land adjacent to the golf course. Plaintiff alleged that defendant's drainage system burdened the watercourse beyond its natural capacity causing the golf course to flood in times of heavy rainfall. Plaintiff contended that, under the capacity-of-the stream rule, the defendant may in the reasonable use of its land drain water from the land into its natural outlet and thus increase the volume and accelerate the flow without incurring liability; but it may not do this beyond the capacity of the watercourse in its natural drainage. Noting that such was not the rule in this jurisdiction, the court held that defendant could collect into sewers the surface water which comes from a watershed area within its borders and discharge it into such watercourse without liability to the plaintiff even though in so doing incidental damage occurred to the plaintiff. (Kuder-Fla)
W69-00545

EBERLE V GREENE (OBSTRUCTION OF SURFACE WATER FLOW).

18 Ill 2d 322; 163 NE 2d 822-826 (1960).

Descriptors: Control, Dams, Water control, *Drainage, Surface drainage, Surface waters, *Illinois, Judicial decision, Water law, *Surface runoff, Water rights, Obstruction to flow.
Identifiers: *Civil law rule.

The plaintiffs, servient landowners, brought an action to enjoin neighboring dominant landowners from obstructing the flow of surface water over their property. The court held that when surface water naturally flowed from the property of the defendants due to the contour of the land, the plaintiffs had a right to have the flow of surface water continue unimpeded. A dam built by the defendants to prevent flow was ordered torn down, with the court holding further that an order to return the boundary to its natural state was sufficiently clear. However, the plaintiffs had the right to build a dam on their property if it did not impede the flow of surface water onto the land of others or change the natural course of drainage. (Headley-Fla)
W69-00546

SHEEHAN V RICHMOND COUNTY (EMINENT DOMAIN AND HIGHWAY DRAINAGE).

100 Ga App 496, 111 SE 2d 924-927 (1959).

Descriptors: Drainage, Drainage systems, *Eminent domain, Tile drainage, Storm runoff, Ponding, Flooding, *Surface runoff, Drainage effects, Surface drainage, *Easements, Georgia, Third party effects.

Plaintiff sued the county to recover damages to his property caused by flooding and ponding water on his property as a result of the highway being so constructed as to expel large quantities of water through water traps and gutters at given points. The highway drainage system for the drainage of rain water from the road had recently been constructed incident to other highway improvements. The continuous channeling of surface water across property to its damage amounts to the taking of an easement over the lands. This falls under the state constitutional provision requiring adequate compensation for property taken or damaged for a public purpose. The fact that plaintiff's property did not abut the highway, as property owned by others was situated between, does not defeat plaintiff's right to recovery. (McDermott-Fla)
W69-00547

MISSISSIPPI STATE HIGHWAY COMM'N V PETERSON (FAIR VALUE IN EMINENT DOMAIN PROCEEDINGS).
117 So 2d 452-454 (Miss 1960).

Descriptors: *Judicial decisions, *Mississippi, *Eminent domain, *Condemnation value, Compensation, Condemnation, Water wells.
Identifiers: Evidence.

This case involved an eminent domain proceeding in which the State Highway Commission condemned a strip of appellees' land. Such taking would include two shade trees and cause damage to a well, which was the only good well in the area. The jury rendered a verdict for $4,200, while the testimony of experts was all to the effect that the damage was less than $1000. However, these witnesses did not consider the shade trees or the well in their estimations. On appeal to the Mississippi Supreme Court, the court held that the verdict was grossly excessive and that such damages were not shown by proper evidence. The court stated that damages could not be recovered by appellees' for losses suffered by neighbors who had used the well. The case was reversed and remanded for a new trial. (R. Williams-Fla)
W69-00548

BERTRAM V STATE ROAD DEPARTMENT (CONSTRUCTION OF BRIDGE OVER WATERWAY).

118 So 2d 674-675 (3d DCA Fla 1960).

Descriptors: Florida, *Remedies, Channels, Water law, *Adjudication procedure, Public rights, Riparian rights, Judicial decisions, Water rights, Inland waterways, *Relative rights, Bridge construction.
Identifiers: Marine interests, Intercoastal waterways.

Plaintiffs, a large number of marine interests, sought a declaratory decree, injunction and other relief to prevent construction of a fifty-five foot vertical clearance fixed span bridge across the intercoastal waterway in Biscayne Bay, Dade County, Florida. This court affirmed the circuit court's dismissal of the complaint for failure to state a cause of action. Plaintiffs right to use the waterway was no greater than that of the public at large since they were not riparian owners. Since special damages different from that inflicted on the public at large were not alleged the plaintiffs stated no cause of action. (McDermott-Fla)
W69-00549

FURTEK V WEST DEER TOWNSHIP (SURFACE DRAINAGE).

19 Pa D and C 2d 169-181 (Com Pl 1959).

Descriptors: Agricultural watersheds, *Drainage systems, Drainage, Ditches, Drainage water, Runoff, Storm drain, Storm runoff, Surface drainage, Surface runoff, *Drainage effects, *Repulsion (Legal aspects), Drains, Soil erosion, Judicial decision, *Pennsylvania, Cities.
Identifiers: Trespass.

The plaintiff brought an action in trespass against the defendant township to recover damages to plaintiff's land allegedly resulting from the closing of a surface drain in a highway. The action of the defendant diverted diffuse surface waters from other areas of natural drainage and caused them to be discharged upon the plaintiff's land, thus increasing the area of the watershed drainage over his premises. The court held that although the plaintiff was required to fight the common enemy as best he could, he was not required to bear more than his share of the burden. The township had no right to cause drainage from other watershed areas to be discharged upon the land of the plaintiff so as to increase the amount of drainage over his property. (Kuder-Fla)
W69-00550

JONES V TOMAN (COMMON-ENEMY DOCTRINE OF SURFACE WATERS).

60 Lack Jur 217-222 (Pa Com Pl 1959).

Descriptors: Water law, *Pennsylvania, Drainage effects, *Surface runoff, Surface waters, Damages, Soil erosion, Alluvion, Relative rights, Judicial decisions, Surface drainage, Runoff, *Repulsion (Legal aspects).
Identifiers: *Common-law rule.

Defendants, neighboring landowners to plaintiffs, filled in a portion of their land. The raised level of their land resulted in surface water and alluvial soil flowing onto the land of the plaintiffs. Defendants acted to improve the drainage conditions of their property. Plaintiffs now suffer a similar problem and are suing to compel its correction and to enjoin this condition from continuing. The common-law rule, or 'common-enemy' doctrine, prevails in Pennsylvania. Thus one may use his property as he pleases and fend off surface waters without taking into account the consequences to other landowners. Since water is descendible by nature, the owner of a dominant or superior heritage has an easement in the servient or inferior tenement for the discharge of all waters which by nature rise in or flow or fall upon the superior. This is true even if alluvial soil is taken along and deposited on another's land. Liability exists only where the owner of the higher land is guilty of negligence which causes unnecessary damage to his neighboring landowner, or where by an artificial channel he collects and discharges surface waters in a body or precipitates them in greatly increased quantities upon his neighbor. Plaintiffs' complaint was dismissed and judgment entered for the defendants. (McDermott-Fla)
W69-00551

MICHAELSON V SILVER BEACH IMPROVEMENT ASS'N INC (OWNERSHIP OF ACCRETION).

173 N E 2d 273-280 (Mass 1961).

Descriptors: *Accretion (Legal aspects), *Massachusetts, Real property, *Riparian rights, *Riparian land, Ownership of beds, Low water mark, Mud flats, Boundaries (Property), Easements, Judicial decisions.
Identifiers: Artificial accretion.

The plaintiff riparian land owner brought suit to enjoin the defendant bathing society from using a beach created by the Commonwealth in front of the plaintiff's land. Under Massachusetts law riparian ownership extends to the low water mark and where accretions are made to land along the seashore, the line of ownership follows the changing water line. The accretion did not have to be due to natural causes for the rule to apply. In some cases, however, where the Commonwealth creates lands as an incident of its power to improve navigation the title belongs to the Commonwealth. In this case there was no showing that the lands were formed as a result of a project to improve navigation and the usual rules of accretion apply even though the land was entirely created by the Commonwealth. (Horner-Fla)
W69-00552

YEZIORO V NORTH FAYETTE COUNTY MUNICIPAL AUTHORITY (RIGHT TO CONTINUED SERVICE FROM PUBLIC UTILITY).

193 Pa Super 271; 164 A 2d 129-144 (1960).

Descriptors: *Utilities, Water works, Public utilities, Water distribution (Applied), Profit, Water conveyance, Judicial decision, *Public rights, Water conveyance, Pennsylvania, Water rates, Pipelines.

This was an appeal from a decree enjoining the municipal authority from discontinuing water service to several customers. Public consumers had attached individual service lines to a private line owned by the local school board. When the school board discontinued service to its building, the authority threatened to stop all service to that private line unless the consumers agreed to take responsibility for the line. The Appellate Court, in affirming the trial court, said that abandonment of service cannot be justified solely on the basis of the private nature of the line. The court also held that public use, inconvenience and hardship to the public, and availability of a substitute service must be weighed against the authority's loss of profits. The court further stated that it was the duty of the authority to provide safe, reasonable service to the public for reasonable and uniform rates. (Sisserson-Fla)
W69-00553

VERMONT WOOLEN CORP V WACKERMAN (WATER POLLUTION ABATEMENT).
167 A 2d 533-541 (Vt 1960).

Descriptors: Vermont, *Water pollution control, Classification, Judicial decisions, Public health, *Legislation, Change orders, Administration, Installation costs, Costs, Riparian rights, Industrial wastes, Industrial plants.
Identifiers: *Police power.

Plaintiff, an industrial corporation, appealed an order of the state conservation board which classified waters adjoining plaintiff's plant as beyond Class D, those that contain sewage or industrial waste to the point of nuisance. Plaintiff attacked the constitutionality of the legislation that gave the conservation board the power to issue such classification orders. The court, in upholding the legislation's constitutionality, stated that the promotion of the public welfare and the providing of the maximum of beneficial use and enjoyment of the waters of the state to its people is a proper exercise of police power. In answer to the plaintiff's complaint of the unreasonable cost of installing equipment to prevent further pollution, the court said that strongly favored policy considerations will outweigh burdensome cost even if financial hardship is placed on a particular individual. The court also said that the board must furnish reasonable notice of its classifications. (Sisserson-Fla)
W69-00554

TOWNSHIP OF HATFIELD V LANSDALE MUNICIPAL AUTHORITY (RIGHT TO PERCOLATING WATERS).

403 Pa 113, 168 A 2d 333-334 (1961).

Descriptors: *Percolating water, *Water wells, Groundwater, Water supply, Water table, *Water rights, Water law, Legal aspects, Water utilization, Equitable apportionment, Reasonable use.

Plaintiff sought to enjoin the defendant municipality from operating its well because a trial run caused dehydration of some surrounding wells and a dimunition in water supply in others. The issue was whether there is a right of absolute appropriation of percolating waters. This court affirmed the trial court's holding that there is no absolute right to appropriate percolating waters where the water is diverted for sale to others away from the land. The trial court was within the broad powers of a court of equity in ordering the municipality enjoined unless it joined to its system without cost all interested injured parties within a radius of 1600 feet from the well. (Horner-Fla)

WILLIAMSTOWN V RUBY (RIGHTS UNDER EASEMENTS).
336 S W 2d 544 (Ct App Ky 1960) 336 SW 2d 544-547 (Ky 1960).

Descriptors: *Kentucky, Judicial decision, *Easements, Competing uses, Access routes, Dams, Public rights, *Property disputes, Usufructuary right.
Identifiers: *Retained rights.

Appellee conveyed an easement to the Department of Fish and Wildlife Resources which was subsequently assigned to appellant city. The easement granted the right to build and maintain a dam on or adjoining appellee's land and create a pool of water thereon. It also granted the right of ingress and egress over a fifty foot strip of appellee's property. The city sought an injunction to stop appellee from trespassing on the fifty foot strip and from operating and renting motorboats for use on the lake. Appellant maintained that it had the right to exercise absolute dominion over it's lake and over the strip of land. The court held that the city took only those rights that were granted in the easement. The rest were retained by the grantee. The easement was granted for the use and enjoyment of the facilities of the dam and the lake by fisherman. The appellee was, therefore, entitled to use the land for any purpose which did not interfere with the proper enjoyment of the easement. (Sisserson-Fla)

LIBRARY U. OF I. URBANA - CHAMPAIGN

Bank erosion, Boundaries (Property), Low water mark, Ownership of beds, Channels, Islands, Legislation, Water law, Judicial decisions.
Identifiers: Evidence.

Plaintiff claimed title to an island which had formed in the Mississippi River adjacent to the defendant's riparian land. A state statute gave counties title to islands formed inside the county and the plaintiff held title under a patent from the county. In Missouri, riparian owners hold title to the low water mark. Evidence showed that the land did not form in the river from that part of the bed to which the state had retained title and hence the title never rested in the county. Therefore the plaintiff's patent did not convey title. The evidence showed that the nucleus of the island was originally accretion on the plaintiff's land which was above the low water mark of the river. Then the accretion grew and a channel was cut between it and the mainland. When the river cuts a new channel, not by eroding away the intermediate lands but by jumping over them leaving a part of the land of a riparian owner intact and identifiable then the title to that land so cut off remains in the riparian owner. (Horner-Fla)
W69-00557

ADAIR V FRISBY (DAMAGES FROM SALT WATER DISCHARGE).
State of Arkansas, Little Rock.

345 SW 2d 468-469 (Ark 1961).

Descriptors: Judicial decisions, *Arkansas, Discharge (Water), *Saline water, Encroachment, Property values, *Water pollution effects, Damages, Overflow, Streams.

Appellees sought damages for the discharge of salt water by appellants into a creek which flowed through appellee's property. The only issue on appeal was whether the judgment was excessive. Appellee testifird that prior to the damage his entire tract of 177 acres was worth $17,000; after the damage was done, the land was worth $10,000. He also introduced evidence that the salt water killed timber, causing it to fall and clog a creek which flowed across his land, thereby overflowing 54.5 acres of the property, reducing such acreage in value from $100 per acre down to $25 or $30 per acre. This damage alone would have amounted to around $4,000, and there was evidence that it would have cost more than $4,000 to clear the creek of fallen timber. Appellants' evidence tended to show that the damages did not exceed $900. On these facts, the court held that the award of $2,375 damages was not excessive, and affirmed the judgment. (Smodish-Fla)
W69-00558

CITY OF DANVILLE V SMALLWOOD (COMPENSATION FOR RETROACTIVE CONDEMNATION).
347 SW 2d 516-520 (Ky 1961).

Descriptors: Judicial decisions, *Kentucky, Condemnation, Cities, *Compensation, Diversion, Storm runoff, Damages, Obstruction to flow, Washouts, Foundation failure, Storm drains.
Identifiers: Restoration.

The City of Danville constructed a storm sewer and in so doing blocked off a former channel which carried off rain water. Water was then forced into a concrete pipe which ended in front of plaintiffs' residence. Dirt piled at the end of the pipe formed an obstruction to the flow of the water. A very heavy rainfall occurred after the city had been notified of the condition, but before any damage had been done. The dirt obstruction caused an unnatural diversion of the water onto the yard of plaintiffs' home and so undermined the foundation of the house that large portions of it collapsed. The yard was also severely washed and damaged. The court held that the facts constituted 'a condemnation suit in reverse,' or 'a retroactive condemnation of land,' and that the City of Danville had to pay compensation to plaintiffs for loss of the use of the home and restoration costs. (Smodish-Fla)
W69-00559

BOARD OF COM'RS V ST LANDRY PARISH SCHOOL BD (COMPENSATION BY STATE FOR TAKING LAND).

130 So 2d 692-696 (Ct App La 1961).

Descriptors: *Louisiana, Judicial decisions, *Condemnation, *Compensation, Levees, Navigable waters, Flood control, Mississippi River, Public rights, Land tenure, State governments.
Identifiers: Constitutional law.

The Louisiana Court of Appeal affirmed a decision in favor of a parish school board in a declaratory judgment action to determine whether a levee board was required to pay a parish school board $182 for lands actually used for a right-of-way for levee and levee drainage purposes. A servitude was found to exist in favor of the public on lands in Louisiana adjacent to navigable rivers and streams for the purpose of constructing and repairing levees to confine the waters of such watercourses. The State may appropriate riparian lands burdened with this servitude without prior judicial proceedings and without compensation for the actual value. The court held that the landowner was entitled to compensation for actual value where, as here, the land was not taken for purposes of confining overflow but rather in aid of the overall diversion of the excess water of the entire Mississippi Valley. This included artificial diversion of waters into floodways or other routes outside the major channel of the Mississippi. (MacMillan-Fla)
W69-00560

NORTH DADE WATER CO V ADKEN LAND CO (ENJOINING LAKE POLLUTION).

130 So 2d 894-899 (3d DCA Fla 1961).

Descriptors: *Florida, Judicial decisions, *Sewage effluents, Pollution abatement, Lakes, *Water pollution, Water law.

An owner of land surrounding two landlocked lakes sought to enjoin defendants from discharging water and sewage effluent through a conduit into the lakes. He claimed that such action constituted a private nuisance (odors and pollution of lakes) and a continuing trespass resulting in irreparable damage for which there was no adequate remedy at law. The Florida appellate court held that the owner was entitled to an injunction where no right to discharge into the lakes had been reserved. The additional expense in discharging into a creek rather than the lakes did not excuse or justify defendant's actions. (MacMillan-Fla)
W69-00561

ROLLAN V POSEY (BOUNDARY LINE DISPUTE).
126 So 2d 464-469 (Ala 1961).

Descriptors: *Boundaries (Property), Real property, *Non-navigable waters, *Ownership of beds, Streams, Tidal waters, Water law, Legal aspects, Riparian rights, Riparian land, *Alabama.

Complaintants and respondents dispute the ownership of land described in both their deeds. The respondent claimed the 40 acres contained in the SE quarter of the NW quarter of Section 12. A non-navigable stream flows through the northern part of the plot. The complaintants' land is to the north of the respondents' and is described as running to the stream. The disputed land lies between the northern boundary of the SE quarter of the NW half and the stream running south of that boundary. The court held that the owner of land bounded by a non-navigable stream owns to thread of the stream. This was the true boundary because the plaintiff had been in possession originally and his title was not disturbed by the respondents adverse possession. (Horner-Fla)
W69-00562

AMERICAN MORTGAGE CORP V LORD (TITLE TO ACCRETIONS).
132 So 2d 40-42 (2 DCA Fla 1961).

Descriptors: *Accretion (Legal aspects), Real property, Boundaries (Property), Riparian lands, Riparian rights, Water law, Legal aspects, Judicial decisions.

The question was whether accreted lands were passed by a deed conveying certain government lots. The lands were described in two ways in the deed. One part said certain lots were conveyed and the other said all of the named lands lying in a certain township. Unless excepted the title to accretions passes with the title to the land to which the accretions are appurtenant. The court held there was no conflict between the descriptions and in neither were the accretions excepted. The accretions passed with the land. (Horner-Fla)

RULES OF CENTRAL AND SOUTHERN FLORIDA FLOOD CONTROL DISTRICT.
Fla Admin Code, Chapter 152, 1968. 29 p.

Descriptors: *Administrative agencies, Budgeting, *Florida, Inter-agency cooperation, Local governments, Planning, Project planning, Regulation, Water districts, *Flood control, Public benefits, Tax rate, Drainage districts, Eminent domain, Permits, Right-of-way, Recreation facilities, Relocation, Political constraints.
Identifiers: Cooperative emergency construction, *Flood control district, Secondary works, Spoil policy, Flood control account.

The District's authority, power, and organization are outlined. It must plan and provide for District works and facilities and cooperate with the federal government and other governmental agencies whenever possible. It has the power of eminent domain. Attention must be paid to recreational uses of District works. The policy for the issuance of permits for the use of District land and works is outlined. General construction requirements are provided for in a separate District publication. Rules are established for the cooperative emergency construction program whereby non-District projects may acquire District assistance. Secondary works may be undertaken in emergency situations. Procedure for acquiring rights-of-way is outlined. The disposal of surplus lands and policy with regard to the relocation of privately owned facilities are provided for. Spoil policy is outlined. Financial procedure, including a flood control account in the general revenue fund and the power to levy a uniform ad valorem tax of up to 1 mill on all property in the District, is established. Officers and employees of the District are prohibited from engaging in political activity. (McDermott-Fla)

A systematic method of deriving a set of regional coordinates is proposed for coordinating water resource activities. It analytically sub-divides a continent into those successively smaller-order confluent and multifluent regions in which surface waters are naturally interrelated. Possible applications of the system, together with resulting surface-water coordinates for the state of Wyoming are presented.

ELECTROMAGNETIC MAPPING OF HAWAIIAN LAVA TUBES,
Hawaii Univ, Manoa.
David von Seggern, and William M. Adams.
Tech Rep 8, Water Resour Res Center, Univ Hawaii, Aug 1968. 27 p, 13 fig, 9 ref. OWRR Project B-005-Hi.

Descriptors: Electromagnetic waves, Radio waves, Hawaii, Surveys, *Geologic mapping, Geological surveys, Subsurface investigations, Hazards, Subsurface waters, *Lava.
Identifiers: *Electromagnetic surveying, *Lava tubes.

A portable, electromagnetic loop-coupling device has been built to locate points on the earth's surface over points in an underground cavity and determine the depth to the cavity. This method requires both an underground and a surface operator who each carry a motorcycle battery, a 20-in.-dia loop antenna, and a compact transceiver circuit. The underground unit transmits to the surface a 1200 hz signal, essentially unattenuated and undistorted. The surface operator locates the transmitter by a nulling procedure. Three methods of determining depth are described. The accuracy of the location and the depth determination with the loop-coupling device is checked with a transit survey. The device was applied with success to Kaumana Lava Tube on the island of Hawaii. Locations confirmed suspicions that the tube ran under roads and buildings. The roof of the tube was found to average about 25-ft thick. Accuracy of a compass-and-tape survey 4400 ft into the tube was checked by locations with the loop-coupling method and found to be in error by 20 ft. Lava tubes are significant as conduits of water and as geologic hazards.

BRIDGER TELEMETRY COMMUNICATIONS SYSTEM,
Montana State Univ., Bozeman, Water Resour. Res. Center.
Robert. A. Leo.
Rep 5 of Proj 779 (See W69-00453 and W69-00454), Jan 1967. 23 p, 13 fig. OWRR Proj B-006-Mont.

Descriptors: *Telemetry, *Communication, Electronic equipment, Data transmission, Instrumentation, *Radio communication systems, Antennas, Maintenance, Montana, Research facilities, Frequency modulation, Experimental data.
Identifiers: Bridger Data Center, Mont.

The Bridger Telemetry Communications System provides Frequency Modulation (FM), Very High Frequency (VHF), radio equipment in order to transmit digital hydrometeorological data from the Bridger Mountain area north of Bozeman, Montana, to the Electronics Research Laboratory on the campus of Montana State University, Bozeman, Montana. Either voice or data mode may be used. The voice mode may be used to communicate in both directions over the link for maintenance purposes and in normal operation is very seldom used. The data mode provides for transmission on 171.9 MHz of digital data in 1 direction only--from Bridger to ERL. The system accepts digital data (gathered and processed by other Bridger area equipment and facilities, and described in other reports) in the Transmitter Control Unit located at the Bridger Recording Center. This report lists events regarding the system; a description of the individual units; a description of the field-strength measurement experiments; plus an appendix consisting of block diagrams, schematics, and experimental data.

A VERSATILE, GAS-OPERATED WATER-LEVEL RECORDER,
Institute of Northern Forestry, Juneau, Alaska.
A. E. Helmers.
Water Resour Res, Vol 4, No 3, pp 619-623, June 1968. 5 p, 4 fig.

Descriptors: *Liquid level gages, Instrumentation, Costs, Gases, Rain gages, Measuring instruments, *Bubbles, Hydrostatic pressures, Nitrogen, Wells, Pressure regulators, Recording systems, *Water stage recorders, Water table, Ground water, Piezometers, Sensors.
Identifiers: *Bubbler system, Water level, Probes (Instruments), Water wells.

A low-cost, gas-operated, water-level recorder is described. The device operates on the basis that the pressure required to bubble gas freely through a liquid is a function of depth. Commercially available gas-operated, water-level recorders are expen-

LIBRARY U. OF I. URBANA - CHAMPAIGN

sive; parts and materials for the described recorder cost less than $200. Water level changes of 0.05 in. can be detected in the laboratory, and under field conditions the maximum sensitivity is 0.1 in. Recorders of this type are highly successful for measuring water levels in piezometers and storage precipitation gages, and appear adaptable to recording stream stages and ground-water levels. (USBR)

BRIDGER INSTRUMENT MODIFICATION,
Montana State Univ., Bozeman.
Duain Bowles.
Water Resour Res Center Rep 2, Sept 1966. 30 p, 15 fig, 2 tab. OWRR Project B-006-Mont.

Descriptors: Instrumentation, *Measuring instruments, Thermometers, Calibrations, Potentiometers, Gages, *Water levels, *Rain gages, Equipment.

The instrument modifications described in this report are intended for use in the Water Resources Bridger Data System. Specifically, the modifications were designed to permit electrical interrogation of existing devices now being operated at the research area. The modifications were to provide a resistive readout of 10 K ohms or operate as a potentiometer. Ideally the modifications would not degrade instrument performance and would permit operation of the instrument as a direct analog recording device. Modifications were designed for operation on the Belfort Universal Raingage, the Leopold Stevens Water Level Recorder, and the Belfort Recording Microbargraph. In addition, thermistor thermometers were constructed to operate at the research areas thermograph locations. Calibration tests were conducted to verify that the instrument modifications met the design requirements.

THE USE OF EIGENVECTORS FOR CLIMATIC ESTIMATES,
Nevada Univ., Reno.
Charles K. Stidd.
Univ Nevada, Desert Res Inst, Preprint Series 36, July 1966. 28 p, 4 fig, 4 tab, 6 ref. OWRR Project B-008-Nev.

Descriptors: Estimating equations, Probable maximum precipitation, Hydrologic cycle, *Approximation method, Reliability, *Mathematical models, Precipitation (Atmospheric), Climatology.
Identifiers: *Eigenvectors, *Orthogonal functions, Precipitation estimates.

Eigenvectors have an advantage over mathematical orthogonal functions in that they are derived from the data being studied and strongly resemble the important features of the data. The process is described by which a matrix of eigenvectors was derived from the sets of 12 mean monthly precipitation values for 60 stations in Nevada. The first 3 eigenvectors (in order of importance) were found to account for 93% of the variance in the original 12 x 60 matrix of raw data and are also found to have features in common with 3 natural cycles of annual precipitation in Nevada. The station multipliers, corrected to a mean elevation, are plotted and analyzed on 3 maps. The method is tested by using it to estimate long-term means for a period of time not included in the input data. Standard errors using the maps and eigenvectors are smaller than for estimates based directly on the short-term station means. Estimates for stations not used in the original input had standard errors small enough to be acceptable. It can be claimed that for a given point in Nevada, the eigenvector method will give as reliable an estimate of the 12 monthly average precipitation amounts as could be obtained from an actual 10-yr record.

AUTOMATED ANALYSIS OF GRID BEAM SYSTEMS,
Iowa State Univ, Ames.
Hotten A. Elleby.
Eng J Amer Inst Steel Constr, Vol 5, No 3, pp 123-127, July 1968. 5 p, 3 fig, 2 tab, 1 chart, 5 ref, append.

Descriptors: Flow diagrams, *Stress analysis, Structural engineering, *Structural analysis, Structural design, Structural members, Boundaries, *Automation, Beams, Moments, Shear stress, Continuous beams, Continuous structures, Programs, *Grid systems, Trusses, Optimum design, Computer programming, Deformation.
Identifiers: Matrix methods (Structural), Computer programs, Boundary Conditions.

An exact solution to a beam grid system can be obtained using Clapeyrons 3-moment equation which can be derived from slope deflection equations. Two unknown quantities per node point are required for the general solution rather than 3 for slope deflection equations. Two boundary conditions are considered: a free boundary where beams are used to support interior members, and a grid system that is continuous over interior supports. The method is divided into 3 phases to simplify computer input. Analysis of a uniformly loaded grid roof system supported at the corners illustrates the use of this method. The method was developed for beam-type members such as wide-flange sections of plate girders, but 2-way truss analysis is responsive where the upper and lower chords are continuous sections and the shearing deformation of the trusses is known to be negligible. A flow chart for the computer program is given. (USBR)

HYDRAULICALLY CONTROLLED BUTTERFLY GATES IN FARM LATERAL TURNOUTS FOR AUTOMATION OF SURFACE IRRIGATION SYSTEMS,
Howard R. Haise, E. Gordon Kruse, and Leonard Erie.
Pap 68-244, Amer Soc Agr Eng 1968 Annu Meet, Logan, Utah, June 1968. 14 p, 12 fig, 5 ref.

Descriptors: *Turnout gates, *Automatic control, Irrigation practices, Irrigation systems, *Laterals, *Gates, *Butterfly valves, Automation, Hydraulic gates and valves, Floats, *Ditches, Plastic tubing, *Surface irrigation.
Identifiers: Farms, Arizona.

An automatic irrigation system was used experimentally to irrigate 10 ac of citrus grown on the coarse-textured Superstition fine sand on the Yuma Mesa in Arizona. A major objective in designing the system was the use of existing farm laterals and turnouts, adapting automated features to them at the lowest cost. The automatic system consists of (1) a source of water at 60-70-psi pressure, (2) solvent-welded 3/4-in. PVC pipe to distribute the water under pressure at selected locations along the farm lateral, (3) 4-way hydraulically controlled pilot valves operating double-acting water cylinders to open and close butterfly gates in turnouts, and (4) sumps with sinking floats to operate 3-way control valves when surface inflow of irrigation water occurs at a predetermined point within the border strip. The automatic system is completely hydraulic, deriving its operating pressure from a pump driven by a water wheel mounted in the flowing water used to irrigate the land. (USBR)

TWO DIMENSIONLESS GROUPS RELEVANT IN THE ANALYSIS OF STEADY FLOWS OF VISCOELASTIC MATERIALS,
Delaware Univ., Newark, Chem. Eng. Dept.
Gianni Astarita.
I and EC Fundamentals, Vol 6, pp 257-262, May 1967. 6 p, 25 ref. OWRR Project A-005-Del.

Descriptors: *Steady flow, Analysis, *Two-dimensional, *Viscous flow.
Identifiers: *Viscoelasticity, Flow patterns.

Five flow patterns (viscometric flow, pure shear, elongational flow, fourth-order flow, and a superposition of the first two) are analyzed. The behavior of fluids characterized by an essentially exponential rate of stress relaxation in such flows is discussed. The discussion leads to the introduction of 2-dimensionless groups relevant for steady flows.

FLOW OF VISCOELASTIC FLUIDS THROUGH POROUS MEDIA,
Delaware Univ., Newark.
R. J. Marshall, and A. B. Metzner.
I and EC Fundamentals, Vol 6, No 3, pp 393-400, Aug 1967. 8 p, 3 fig, 1 tab, 50 ref. OWRR Project A-005-Del.

Descriptors: Bibliographies, *Viscous flow, Flow, *Porous media, Experimental data, *Fluid friction, Flow resistance, Permeability, Analysis.
Identifiers: *Viscoelasticity, Deborah number, Test results.

This work was undertaken to define the conditions under which the Deborah number may become large enough to cause significant deviations from the usual drag coefficient-Reynolds number relationships for purely viscous fluids flowing through porous media under noninertial conditions. The analysis suggests that major effects may be expected at Deborah numbers from 0.1 to 1.0. Experimental studies, using a porous medium, support this analysis and yield a critical value of the Deborah number at which viscoelastic effects were first found to be measurable. Influences of a high Deborah number level upon the uniformity of the flow and upon the distribution of the fluid residence times in porous media are considered.

RECENT PROGRESS IN THE FIELD OF SYNTHETIC TESTING OF CIRCUIT-BREAKERS,
P. Heroin, J. C. Henry, and C. Marty.
Pap 13-11, Int Conf Large High Tension Elec Syst, Paris, France, June 1968. 19 p, 17 fig, 10 ref.

Descriptors: *Circuit breakers, *Test procedures, Extra high voltage, Statistics, Test facilities, Stress, Experimental data, Characteristics, Probability, Electric currents, Electric potential, Fluorides, Research and development, Electric arcs, Mathematical analysis, Sulfur compounds, Performance tests, Dielectrics.
Identifiers: *Airblast circuit breakers, *Synthetic test methods, Test results, France, Foreign research, Short circuits, *Sulfur fluorides.

With transmission voltages becoming higher and higher, new methods are required for testing circuit breakers at these higher voltages and currents. Research has been undertaken in France to develop and explore the current injection synthetic test methods and to gain better knowledge of circuit breaker phenomena. Numerous statistical tests were performed on two types of circuit breakers (airblast and sulfur hexafluoride) to compare direct testing methods with synthetic testing methods. The general methodology for testing circuit breakers is discussed. Results of asymmetrical current tests on an airblast circuit breaker are given. A satisfactory method is described for prolonging the test beyond the first zero. Phenomena related to high and low restriking during shortcircuit tests on a sulfur hexafluoride circuit breaker are studied. Investigations of the low probability of the reignition point showed that the percentage of reignitions at the first zero obeyed a Gaussian law for percentage values between 0.6 and 95%. Synthetic tests were concluded to be the best method for testing airblast and sulfur hexafluoride circuit breakers. (USBR)

Pap 22-03, Int Conf Large High Tension Elec Syst, Paris, France, June 1968. 7 p, 6 fig, 1 tab.

Descriptors: Structural analysis, *Transmission towers, Design tools, *Design criteria, Test procedures, *Test facilities, Experimental data, Steel structures, Aluminum alloys, Compression, *Towers, Dynamometers, Fabrication, Live loads, Dead loads, Tolerances (Mechanics), Extra high voltage, *Guyed towers.
Identifiers: *Test results, Testing equipment, Testing, Loading tests, *Lecco Station, Italy, Foreign research, Slenderness ratio.

Experience gained during the past eight yr of transmission tower testing at Italy's Lecco test station is reported. The test station and facilities for testing ehv towers are described. Results of tests on guyed and aluminum towers are discussed. Compression formulas proposed by the American Society of Civil Engineers in its Aug 1967 report 'Electrical Transmission Line and Tower Design Guide' have been verified experimentally. The verification ascertains the correctness of the proposed formulas and the high success probability of load tests performed on structures designed according to the ASCE design criteria. (USBR)

Identifiers: *Ultra high voltage, Electrical insulators, Switching surges, Electrical design, Testing equipment, Electric conductors.

Significant conclusions reached at Project EHV in Pittsfield, Mass, during the 1965-66 ehv program are described, and the facilities and program for extending this research to voltage levels up to 1500-kv ac are outlined. New information cited includes: (1) switching surge strength of insulator-tower configurations, (2) air-density and humidity correction factors for long insulator assemblies, and (3) electrical strength of contaminated insulators. The 1967-71 program will initially use cages to simulate the field surrounding short sections of ultra-high-voltage conductors. A single-phase transformer will be used in 1969 to energize full-scale conductor and insulator configurations suitable for voltages of 1000 to 1500 kv. Testing of artificially and naturally contaminated insulators will include superposition of switching surges on 60-cycle voltage. Ultra-high-voltage systems of 1000 to 1500 kv technically are feasible for overlay of 500- and 765-kv systems; however, economic application will depend on refinements and innovations in transmission design such as form the objectives of the Project Ultra-High Voltage Program. (USBR)

CORONA IN POWER TRANSFORMERS,
Industrie Elettriche di Legnano, Italy; McGraw-Edison Power System Division, Milwaukee, Wis; Ferranti Ltd, Great Britain.
S. Yakov, C. C. Honey, and A. B. Madin.
Pap 12-06, Int Conf Large High Tension Elec Syst, Paris, France, June 1968. 11 p, 9 fig, 6 tab, 13 ref.

Descriptors: *Power transformers, *Electrical coronas, Oscillographs, Detection, *Electric insulation, Methodology, Instrumentation, Research and development, Radio interference, Static electricity, Dielectrics, Ultrasonics, Measurement, Laboratory tests, Electrical engineering, Oils.
Identifiers: Protection (Electrical), Insulating oil, Insulation, Dielectric properties.

Detection methods capable of indicating small partial discharges in complex insulation structures of power transformers during dielectric tests are available to manufacturers and users. Experiments are presented using three widely publicized corona detecting techniques: (1) the NEMA Noise Meter for measuring changes in voltage, (2) the charge detector for measuring charge displacement, and (3) the ultrasonic detector for measuring acoustic disturbances. A summary is given of test data obtained on samples and models of transformer insulation structures. These data may answer some questions relative to corona in transformers. Many problems remain unsolved and the answers will come only through publication and discussion by the industry of test results. (USBR)

TRANSIENT VOLTAGES CAUSED BY THE OPERATION OF CIRCUIT-BREAKERS IN HIGH-VOLTAGE SYSTEMS: SWITCHING OVERVOLTAGES WHEN CLOSING LINES AT NO-LOAD AND TRANSIENT RECOVERY VOLTAGES WHEN INTERRUPTING FAULTS CLOSE TO TRANSFORMERS.
Brown Boveri and Co, Baden, Switzerland; Sprecher and Schuh, Aarau, Switzerland.
H. Glavitsch, E. Ruoss, and R. Thaler.
Pap 13-05, Int Conf Large High Tension Elec Syst, Paris, France, June 1968. 14 p, 12 fig, 2 tab, 4 ref.

Descriptors: Extra high voltage, *Circuit breakers, Transients, Power transformers, Test procedures, *Transmission lines, Networks, Frequency, Faults (Electrical), Investigations, Electrical impedance, Stress, Test facilities, Electric potential.
Identifiers: *Switching surges, *Overvoltage, Switzerland, Flashover, *Short circuits, Overhead ground wire, Foreign research.

The problems concerning high-voltage circuit breakers discussed have more significance with the increase of rated voltage and short-circuit capacity of high-voltage networks. An understanding of these problems is essential for economic design of high-voltage systems and equipment. The first problem concerns the overvoltages that occur when energizing a transmission line at no-load by a circuit breaker. The influence of different network and line parameters on the magnitude of switching surges is shown, and the frequency of overvoltage occurrence depending on different circuit breaker parameters is examined. Nonsimultaneous closing of the 3 poles of a circuit breaker is considered. Voltages of lines studied were 245-, 420-, and 765-kv. The second problem involves transient recovery voltage and natural frequencies when interrupting a short circuit at the terminals of a circuit breaker, the fault being fed from a network by transformers. Recovery voltages with frequencies up to 30 khz and an amplitude factor of 1.8 to 1.9 may occur. A recommendation is given for laboratory simulation of this stress on a circuit breaker during test. (USBR)

DEVELOPMENT OF ROTATING RECTIFIER EXCITERS,
UCE Linalux-Hainaut, Belgium; Ateliers de Constructions Electriques de Charleroi, Belgium.
P. Robert, P. Bawin, and J. Dispaux.
Pap 11-05, Int Conf Large High Tension Elec Syst, Paris, France, June 1968. 17 p, 17 fig, 6 tab, 4 ref.

Descriptors: *Excitation, *Semiconductors, Magnetic fields, Leakage, Design, *Rectifiers, Electric power, Electric currents, Electric fields, Electrical stability, *Electric generators, Electric potential, Direct currents, Alternating currents, Losses.
Identifiers: Leakage current, *Rotating machines, *Electrical design, Foreign research, Belgium, Flux density, Harmonics, Machine design.

Several aspects of exciter design using semiconductor rectifiers are analyzed. Machine design and methods for reducing differential leakage and stray load losses in windings are discussed. This analysis is conducive to the study of the classical star-connected 3-phase windings and polygonally connected windings with a higher number of phases. A comparison of different possibilities is made using tables, curves, and winding arrangements. The definition of exciter speed of response has been adapted to take into account the influence of armature reaction; this variation has been examined as a function of the number of poles and of various design parameters. Time constants for rotating rectifier exciters are similar to those for d-c exciters

LIBRARY U. OF I. URBANA - CHAMPAIGN

of the same speed, and considerably lower than those for exciters used on large a-c generators. Manufacturers have several methods at their disposal to overcome problems of differential leakage, supplementary losses, and attendant voltage drops. (USBR)
W69-00575

IMPORTANCE OF FRETTING IN VIBRATION FAILURES OF STRANDED CONDUCTORS,
Alcoa Research Laboratories, New Kensington, Pa and Massena, N Y.
William G. Fricke, and Charles B. Rawlins.
Inst Elec Electron Eng Trans Power App Syst, Vol PAS-87, No 6, pp 1381-1384, June 1968. 4 p, 6 fig, 8 ref.

Descriptors: *Fatigue (Mechanics), *Failure (Mechanics), *Vibrations, Corrosion, *Transmission lines, Tensile stress, Test procedures, Oxides, Test specimens, Laboratory tests, Spectroscopy, Coatings, Films, Cracks, Investigations, Aluminum alloys, Abrasion, Friction.
Identifiers: *Fretting, *Electric conductors, Aeolian vibration.

Surface fretting between conductor strands and support hardware plays an important part in conductor fatigue failures initiated by aeolian vibration. Examination of conductor strand failures from lines in service and from laboratory spans shows that fatigue cracks originate at fret marks in all cases. Laboratory fatigue tests indicate that fretting causes a reduction in fatigue strength of conductor strands, below that of unfretted wires, by a factor of 1.6. Test procedures are explained and results of metallographic examination of 23 laboratory fatigue test specimens and 7 in-service failures are discussed. Fretting effects can be reduced by applying surface coatings, but their permanence remains undetermined. (USBR)
W69-00579

CONSIDERATIONS IN PLANNING FOR RELIABLE ELECTRIC SERVICE,
General Electric Co, Schenectady, N Y.
Charles Concordia.
Inst Elec Electron Eng Sprectrum, Vol 5, No 8, pp 71-76, Aug 1968. 6 p, 3 fig, 5 ref.

Descriptors: Electric power, *Reliability, Design, Planning, *Electric power production, *Transmission (Electrical), Disturbances, Frequency, *Power system operations, Electric relays, Faults (Electrical), Loads.
Identifiers: *Load shedding, *Load-frequency control, Interconnected systems, Tie lines, Outages, Operating criteria, Load flow.

Satisfactory levels of reliability of bulk-power generation transmission systems depend on sound principles of planning, design, and operation, rather than revolutionary changes. To assure this reliability, it requires effective transmission and adequate interconnections, adherence to operating limitations, and recognition that an unforeseen contingency will cause system separation and generator deficiency. The first consideration requires system studies to demonstrate that no single disturbance will cause cascading tripouts of lines or generators; the second may be facilitated by automatic monitoring of the system condition; and the third requires automatic load shedding on low frequency. Designing and operating principles required for satisfactory service reliability are summarized. The stages of system planning for determining proper system design and required transmission and generation capacity are outlined. System operating limits and system splitup are discussed. (USBR)

MAJOR HYDROELECTRIC POWER PLANTS IN TEXAS: HISTORICAL AND DESCRIPTIVE INFORMATION,
Texas Water Development Board, Austin, Texas.
F. A. Godfrey, and C. L. Dowell.
Tex Water Develop Board Rep 81, 93 p, Aug 1968. 28 fig, 22 tab, 10 ref.

Descriptors: *Data collections, *Hydroelectric plants, *Texas, Dams, Electric power production, Engineering structures, Water rights, Water utilization.
Identifiers: *Electrical energy generation.

Descriptions of the 25 major hydroelectric powerplants in Texas are given chronologically to show their historical development to Jan 1, 1968. Records of electrical energy generated at each plant follows the plant description. Included are descriptions of 4 plants which are no longer in operation. Information on the water rights applicable to each powerplant is presented. Photographs of some of the plants are included. No description is given of the many small hydroelectric plants used by early settlers to operate grain mills, cotton gins, saw mills, water pumps, and other equipment. These are described in 'The Water Power of Texas' (Taylor, T W, 1904). (Lang-USGS)

NONLINEAR FLOW THROUGH GRANULAR MEDIA,
Imperial College of Science and Technology, London, Great Britain.
David Ellis Wright.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 94, No HY4, pp 851-872, July 1968. 22 p, 9 fig, 1 tab, 23 ref, 3 append.

Descriptors: *Granular materials, *Flow, *Fluid flow, Anemometers, Hot wire anemometers, Reynolds number, Flud friction, Unsteady flow, Steady flow, Velocity, Turbulence, Laboratory equipment, Laboratory tests, Air, Gravels, Sands, Permeameters, Boundary layer, Hydraulics, Bibliographies.
Identifiers: Foreign research, Great Britain, Resistance coefficients, Darcys law.

Relative roles of steady and unsteady fluid motion in causing deviation from the linear Darcy resistance law are described. Air velocities and turbulence intensities were measured within the pores of a gravel bed by hot-wire anemometers. Results indicate that although the linear resistance relation ceases to be valid at a Reynolds number of 2, velocity fluctuations do not begin until the Reynolds number is 100, and turbulence is not fully established until the Reynolds number is 800. Studies of waterflow through a coarse sand bed show that convergence of the macrostreamlines significantly reduces the resistance at Reynolds numbers over 10, the proportionate reduction increasing with flow. Observations are interpreted in terms of flow through coiled pipes or around immersed objects; 4 regimes of flow through granular media are proposed. (USBR)
W69-00577

FLOW AROUND A VERTICAL SHEETPILE EMBEDDED IN AN INCLINED STRATIFIED MEDIUM,
Northwestern Univ, Evanston, Ill.
Raymond J. Krizek, and Vera B. Anand.
Water Resour Res, Vol 4, No 1, pp 113-123, Feb 1968. 11 p, 7 fig, 23 ref, append.

Descriptors: *Flow, *Fluid flow, *Sheet piling, Stratification, Porous materials, *Permeability, Anisotropy, *Seepage, Bibliographies, Models, Laboratory equipment, Laboratory tests, Hydraulic models, *Groundwater flow, Sandstone, Flow nets.
Identifiers: *Flow around objects.

The steady-state flow around a vertical sheetpile embedded in an inclined stratified porous medium underlain by an impervious boundary is studied experimentally. The porous medium is a synthetic sandstone composed of alternating thin layers of 2 sand-epoxy mixtures with different coefficients of permeability. The problem is subjected to a coordinate transformation by considering the layered system as homogeneous and anisotropic; a graphical flow net solution is obtained for the streamlines, potential distribution, and flow quantity. The complex variable theory and conformal mapping techniques are used to obtain an approximation for flow quantity and exit gradient variation. Experimental results on streamlines, potential distribution, flow quantity, and exit gradient were obtained from a model study, and exhibited variations from predicted theoretical results, especially in flow quantities. A systematic study of experimental errors suggests that these variations cannot be attributed wholly to experimental sources and implies that the effective permeability of a stratified porous medium cannot be determined by considering the system as homogeneous and anisotropic. Identifiers: *Soil dynamics, Earthquake loads, Dynamic response, Dynamic tests, Dynamic loads.

Soil dynamics is concerned with rapidly varying stresses in a soil mass. The relationship between soil dynamics and applied sciences of rheology, geophysics, and seismology is discussed. Three types of time-dependent stress conditions are considered in soil dynamics: (1) transient--a single pulse that reaches a maximum quickly and may cause failure; (2) repeated--may not cause failure immediately but may alter soil properties and cause failure eventually; and (3) oscillatory--varies roughly sinusoidally with time. Transient loading tests on clays show that strength and modulus of deformation increase with rate of strain. Rate of strain has little effect on properties of granular materials under transient loading. Repeated loading of some clays increases the ultimate strength as much as 3 times its original value. Oscillatory loading may result from artificial (machine vibrations) and natural (earthquakes) sources. Granular materials having the proper degree of saturation and density may liquefy and lose shearing resistance when subjected to oscillatory loading. Tests show that cohesive soils may fail after several cycles at a stress much below short-duration transient or static values. (USBR)

SELECTION OF ANALYTICAL METHODS AND STRENGTH PARAMETERS FOR SLOPE STABILITY INVESTIGATIONS IN COHESIVE SOILS,
Idaho Univ, Moscow.
Robert L. Schuster.
Highway Res Rec, No 223, 1968. 8 p, 4 fig, 4 tab, 18 ref.

Descriptors: Slopes, *Stability analysis, *Cohesive soils, Cohesion, Clays, Shear strength, Embankments, Pore pressures, Cut slopes, Internal friction, Failure (Mechanics), Consolidation, Overconsolidation, Strain, Shear tests, Effective stress, Total stress, Fissures, Bibliographies, Soil mechanics, Cuts.
Identifiers: Failures, Failure surfaces, Strain rate, Soil properties, *Slope stability, Slip surface, Bishops method, Slip-circle method.

Case histories of slope failures in clays are reviewed to aid in selecting the proper shear strength parameters and methods of stability analysis. The phi equals zero total stress method is satisfactory for short-term stability analysis of nonfissured clays. The phi equals zero analysis is not safe for short-term stability of fissured, overconsolidated clays unless the reduced strength due to the presence of fissures is considered. When working with overconsolidated clays, the rate at which the undrained shear test is conducted has considerable effect on the laboratory undrained shear strength, and the undrained shear strengths obtained in the common 15-minute test may be higher than those in the slope at failure. Analysis on an effective stress basis is preferable to the phi equals zero total stress analysis for long-term stability of slopes in nonfissured clays. Bishops method results in better analyses than the conventional method of slices that produces factors of safety for the failure state that are 15-20% too conservative. Effective stress methods of analysis should be used for long-term stability of slopes in overconsolidated clays containing fissures or other discontinuities. (USBR)

LABORATORY INVESTIGATION ON THE USE OF HIGH MOISTURE CONTENT SOILS IN HIGH FILLS,
Kentucky Univ, Lexington; Virginia Highway Research Council.
Y. H. Huang, and F. D. Shepard.
Highway Res Rec, No 223, pp 45-59, 1968. 15 p, 7 fig, 3 tab, 11 ref.

Descriptors: *Moisture content, *Embankments, Soils, *Shear strength, Consolidation, Direct shear, Thixotropy, Silts, Loams, Test procedures, Compaction, Saturation, Shear tests, Soil physical properties, Density, Cost comparisons, Void ratios, Soil mechanics, Pore pressures, *Fills, Test specimens, Compaction tests.
Identifiers: Soil density, Test results.

Dunmore silt loam and Clarkesville clay loam were used to investigate the effects of high moisture-content soils in high fills. Soil specimens were fabricated by static compaction and investigated by direct shear and conventional consolidation tests. The soil did not exhibit thixotropic behavior under given test conditions. Shear strength increased with consolidation pressure, the rate of increase being greater at lower densities. Initial density had the greatest effect on shear strength when soils were not subjected to consolidation. Regardless of initial density and strength, soils subjected to high consolidation pressures would arrive at some density and strength that were only slightly different. Based on the assumption that density is the most important factor affecting strength and on Terzaghi's theory of consolidation, a procedure is suggested to determine the depth below which wet soils would be placed and the length of drainage path required to effect a given degree of consolidation. A cost analysis must be conducted before any decisions on using high moisture-content soils are made. Handling wet material and installing drainage may be more expensive than importing borrow material. (USBR)

CALCULATION OF DEEP SUPPORTS IN TERMS OF DEFORMATIONS,
Kh R. Khakimov.
Soil Mech Found Eng, No 6, pp 402-406, Nov-Dec 1967. 5 p, 3 fig, 1 tab, 4 ref. Transl from Russ, Osn, Fundamenty i Mekh Gruntov, No 6, pp 14-17, Nov-Dec 1967.

Descriptors: *Foundations, Cast-in-place structures, Piles, Analysis, Pile foundations, *Supports, Elastic deformation, Plastic deformation, Strain, Stress-strain curves, Settlement, Shear failures, Consolidation, Shear strength, Footings, Soil physical properties, Poisson ratio, Soil mechanics.
Identifiers: Foundation modulus, Deep footings, Foreign research, USSR, Deformation modulus.

The design of deep foundations can be expedited by using deformations involving the linear relation between stress and strain. However, designs considering the nonlinear relation of stress and strain are needed for better use of soil resistance and to lower foundation costs. Separate determination of settlements caused by soil consolidation and by development of a shear zone is proposed. In 1 case the settlement resulting from consolidation was 19.9 cm and 1.1 cm from shear, or 6%. Simplified calculations of deformation for deep supports (large cast-in-place piles) require consideration of 2 factors: (1) The relation between stress and strain is nonlinear, causing the modulus of soil deformability to be variable. (2) Strain is composed of permanent set and elastic strain, the first being greater. Equations are presented for the deformability modulus, limits of proportionality, nonlinear deformability of soil, and strain. A table lists 11 sets of tests on different soils. The analysis accommodates soil resistance beyond the limits of linear stress-strain relation and permits increasing the load on the supporting soil by a factor of 1.4 to 2. (USBR)

A REVIEW OF RECENT RESEARCH ON STRENGTH AND CONSOLIDATION OF SOFT SENSITIVE CLAYS,
University of Toronto, Canada.
T. Cameron Kenney.
Can Geotech J, Vol 5, No 2, pp 97-119, May 1968. 23 p, 12 fig, 3 tab, 43 ref.

Descriptors: *Shear strength, Shear forces, *Shear resistance, Failure (Mechanics), Shear stress, *Clays, *Consolidation, Deformation, Internal friction, Cohesion, Sampling, Clay minerals, Boundaries, Triaxial shear, Shear tests, Undisturbed samples, Laboratory tests, Shear strain, Direct shear, Soil mechanics, Preconsolidation, Bibliographies.
Identifiers: *Compressibility, Strain energy, At rest pressure, Bond, Secondary consolidation, Foreign research, Canada.

New concepts have been developed of strength and consolidation of soft sensitive clays. Shear strength and compressibility are measures of a soil's resistance to deformation but for different boundary conditions. These soil behaviors depend on shear resistance that can be developed at contacts between individual mineral particles. The coefficient of friction depends on mineralogy of the particles and degree to which particles are parallel oriented. Shear resistance of parallel-oriented, plate-shaped, clay minerals can be more than 30% less than for randomly oriented particles. Cohesion is caused by net attractive forces between adjacent particles (Van der Waal forces) and interparticle linkages formed by polarized ions. Undisturbed soft sensitive clay samples are impossible to obtain because stress changes that accompany sampling cause irrecoverable strains in the clay. Soft clays do not behave elastically when restressed to their in situ stresses; in situ behavior cannot be reproduced in the laboratory simply by reapplication of stress. Situations and reasons are given for the preconsolidation pressure being greater than the greatest overburden ever experienced by a soil. (USBR)

8E. Rock Mechanics AND Geology

STATIC LOADING ON THE SURFACE OF LAYERED MEDIA,
Columbia Univ, New York, N Y.
J. T. Kuo, G. Barla, and S. H. Boshkov.
Pap, Preprint No 68-AM-101, Annu Meet Amer Inst Mining, Met, Petrol Eng, New York, Feb 1968. 45 p, 10 fig, 1 tab, 7 ref.

Descriptors: Loads, Statics, *Underground structures, *Rock mechanics, Mining engineering, Mathematical analysis, Matrix algebra, Model tests, Stress, Structural models, *Stress analysis, Elasticity, Displacements, Structural analysis.
Identifiers: Boussinesq equation, Static behavior, Underground openings.

The Boussinesq solution to the problem of a normal static load on the surface of a half-space has wide application to loading problems in engineering. The generalized solution of an inclined static load on the surface of a multilayered half-space is applied to a system of randomly distributed inclined loads, simulating conditions of circular pillar loading in a mine. Inclined loads are assumed to be a linear combination of a normal load and an asymmetrical shear load. Such loads may arise from applied displacements, applied stresses, or combinations of both. Each layer is considered homogeneous and isotropic; layer interfaces are assumed perfectly welded. The problem is solved using the Thompson-Haskell matrix formulation which avoids the cumbersome nature of the problem and is easily adaptable to numerical evaluation. Stresses from a normal static load are calculated and compared with geletin model tests, simulating mining conditions of pillar loading on continuous horizontal-layered media. (USBR)

LARGE DIAMETER NONREINFORCED CAST-IN-PLACE CONCRETE PIPE,
Ernest C. Fortier.
J Amer Concr Inst, No 7, Proc V 65, pp 544-549, July 1968. 6 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Concrete pipes, Concrete placing, *Pipes, Construction, Pipelines, *Cast-in-place structures, Concrete, Irrigation, Structural analysis, Sewers, Costs, Construction costs, Cost comparisons, Trenches, Forms (Concrete), Field tests, Shoring, Excavation.
Identifiers: Sacramento Valley, Calif, Formwork (Construction), *Cast-in-place pipes, Construction equipment, Concrete properties.

Recent installations of large-diameter (60, 72, 84, and 96 in.) nonreinforced cast-in-place pipe have shown satisfactory performance. Continuous casting machines can be constructed for large pipe as easily as for small pipe if proper design and mechanization are used. Sacramento County, Calif, one of the early users of large pipe, made its first installation in 1955. Th County found that the principal advantage of cast-in-place pipe was to be found in 30 to 40% cost savings over conventional pipe. The continuous casting process developed by No-Joint Concrete Pipe Co is described. A separate slipform is required for each pipe size. Aluminum part-circle forms are used to support 230 deg of the inside of the pipe. In many respects large sizes facilitate rather than hinder construction of

LIBRARY U. OF I. URBANA - CHAMPAIGN

monolithic pipe by the continuous casting process. Compressive strength of concrete is specified as 3000 psi. Excavation is accomplished with back hoes or ladder-type excavators. Hardpan soils offer ideal conditions for monolithic pipe, but expansive soils must be expanded fully before concrete placement. Strength tests show that pipes up to 120 in. could be made to safely support earth and live loads normally encountered in irrigation systems, storm drains, and sanitary sewers. (USBR)

GUIDE FOR LOW DENSITY PRECAST CONCRETE FLOOR, ROOF, AND WALL UNITS,
Albert Litvin, L. E. Rivkind, and Leslie A. Barron.

J Amer Concr Inst, No 7, Proc V 65, pp 507-512, July 1968. 6 p, 1 tab, 17 ref.

Descriptors: *Lightweight aggregates, *Precast concrete, Deflection, Concrete testing, Slabs, Concrete technology, Prefabrication, Concrete, Perlite, Roofs, Walls, Structural design, Design data, Bibliographies, Thermal conductivity, Vermiculite, Shrinkage, Elasticity modulus, Curing, Acceptance tests, Floors.
Identifiers: *Lightweight concretes, Fire resistance.

Design and fabrication practices are outlined for low-density (50 pcf and under), precast, reinforced-concrete floor, roof, and wall units that will result in members of adequate load capacity, durability, appearance, and overall serviceability. Units covered in this guide should be protected from free entry of water. Current editions of applicable ASTM specifications are listed for the materials covered in the guide. Low-density concrete should have a minimum compressive strength of 300 psi, and average drying shrinkage should not exceed 0.20%. Low-density concrete units should be designed for allowable working stresses, service loads, and accepted straight line theory of design. Deviations from design requirements and treatment of regular concrete are discussed. (USBR)
W69-00583

CONCRETE WITH REINFORCED PLASTICS COATING,
Technical Univ, Prague, Czechoslovakia.
Vladimir Weiss.
Tech Dig, Vol 10, No 6, pp 369-374, June 1968. 6 p, 5 fig, 2 tab, 7 ref.

Descriptors: *Composite materials, *Laminates, *Sandwiching, Plastics, Reinforcing, *Reinforced concrete, Materials, Materials forming, Foreign design practices, *Coatings, Brittleness, Tensile strength, Cracking, Bending stress, Glass fibers, Ceramic materials, Concrete structures, Concrete.
Identifiers: Czechoslovakia, Polyesters, Glass reinforced plastics, *Plastic coatings, Composite beams.

The possibility of replacing steel reinforcement in concrete with reinforced plastics or glass fiber has kept researchers busy for many years. Work in Czechoslovakia has been concentrated on coating concrete and similar brittle materials with glass-fiber-reinforced polyester resin. The coating delays formulation of cracks and improves extensibility and bending strength of concrete and ceramic products. Tests were conducted to clarify the load-sharing mechanism and properties of coating and core materials affecting test results. The effect of the coating on extensibility, tensile strength, and bending strength of brittle materials has been so pronounced that prestressed concrete often may be replaced by ordinary reinforced concrete. A procedure is given for designing combinations of brittle core materials with resilient coatings. The method is applicable to combinations of concrete or ceramics with prestressed concrete, resin concrete, or sheet metal; asbestos-cement with fiber-reinforced plastics; and sandwich materials of lightweight concrete, hard-formed materials, and asbestos-cement materials. FIELD TECHNIQUES FOR SEALING LEAKY CONCRETE PIPELINES WITH AMMONIATED IRRIGATION WATERS, OPEN AND CLOSED CONDUIT SYSTEMS RESEARCH PROGRAM,
California Univ, Davis; Solano Irrigation District, Vacaville, Calif.
K. K. Tanji, L. D. Doneen, and J. V. Kubes.
Bur Reclam Lab Rep ChE-79, Chem Eng Br, May 1968. 54 p, 2 map, 11 tab, 20 photo, 7 ref.

Descriptors: *Concrete pipes, *Cracks, Chemistry, Water analysis, pH, Conduits, Pipelines, *Leakage, Water transportation, Seepage, Additives, Chemicals, *Sealing compounds, Maintenance, Operation and maintenance, *Lime, *Chemical precipitation, Irrigation O and M.
Identifiers: *Calcium carbonate, Irrigation water, *Anhydrous ammonia, Chemical reactions, *Chemical sealants, Solano Project, Calif.

A method is described for sealing narrow cracks in concrete pipelines. Anhydrous ammonia and other amendments added to water produce a hard calcium carbonate precipitate which deposits in cracks in the pipe and seals the leaks. Laboratory investigations were made on the chemistry of surface and ground waters suitable for lime precipitation. Selective precipitation of lime from ammoniated waters and its adherence to concrete pipelines are largely dependent upon the chemical composition and imposed treatments. Many irrigation waters are not suitable for precipitating lime unless treated with appropriate amendments. Theory and principles from the laboratory research were applied in field tests. Methods and techniques were developed for sealing leaky concrete pipelines. The field application and results obtained in some treatment operations with surface and well waters are presented. (USBR)

CRITERIA FOR CATHODIC PROTECTION OF STEEL IN CONCRETE,
American Pipe and Construction Co, South Gate, Calif.
D. A. Hausmann.
Preprint Pap No 74, Nat Ass Corros Eng, Cleveland, Ohio, 1968. 4 p, 5 fig, 7 ref.

Descriptors: *Cathodic protection, Corrosion, *Corrosion control, Concrete structures, Portland cement, Chlorides, Electrolysis, Steel, Electrochemistry, *Reinforced concrete, *Reinforcing steel, Electrodes, Electric potential, Design criteria, Electric currents, Polarization.
Identifiers: Corrosion tests, Corrosion resistance, Stray current corrosion, Corrosion currents.

Cathodic protection is a useful corrosion control technique, but indiscriminate use can be costly and damaging. Misapplication is possible with reinforced concrete structures if the passivating effect of portland cement is not recognized. Some reinforced concrete structures are cathodically protected, as if they were bare or coated steel structures, by using the buried steel pipeline criterion of applying current to maintain a minimum steel potential of -0.85 v to a copper sulfate electrode. Experimental results show that this criterion is not applicable to steel cast in concrete and will result in overportection. Steel corrosion can be prevented in concrete exposed to a high chloride environment if sufficient current is applied to shift the steel polarization potential to a minimum value of -0.50 v to a copper sulfate electrode. Steel corrosion can be arrested in chloride-contaminated concrete by shifting the polarization potential to a minimum value of -0.71 v to a copper sulfate electrode. The polarization potential should be shifted to a minimum of -0.40 v to a copper sulfate electrode to prevent damage by stray current electrolysis. (USBR)

Descriptors: *Architecture, *Concrete, Concrete finishing, Coatings, Precast concrete, Building materials, Buildings, Shell structures, Forms (Concrete), Finishes, Concrete placing, Joints, Curing, Specifications, Reinforced concrete, Shrinkage, Costs, Aggregates, Creep, Structural engineering, Abrasive blasting, *Aesthetics, Construction, Planning.
Identifiers: Exposed aggregate concrete, Concrete construction, Concrete properties.

This series of papers is based on a symposium presented at the 1966 ACI Fall Meeting in New Orleans. The papers review considerations required for architectural concrete that must be structurally sound, aesthetically pleasing, and economical. Following a brief introduction, 4 authors discuss the architects' approach, structural implications, planning requirements, and construction. When an architect selects concrete as the aesthetically correct material, he must check the structural appropriateness. In addition to obvious design considerations, the structural designer must give special attention to detailing placement of joints, placement of reinforcement, and curing methods to obtain the desired effects. Advance detailed planning is important when using architectural concrete because lines that appear effective on drawings can be difficult and costly to achieve in construction. Building with architectural concrete requires detailed consideration of materials, forming techniques, concreting operations, and surface finishing. (USBR)

Identifiers: *Wetting, Separation, Double layer, Resins.

The technology of pigment dispersion in polymer paint manufacturing is reviewed. The dispersion process is complicated, incompletely understood, and in practice is regularly and consciously neglected as to its scientific delicacy. Our present imperfect understanding starts with uncertainty about the pigment surface structure and is complicated by the great variety of phenomena as the liquid polymer finds its place upon the solid particle. Absorption mechanisms and theories of dispersion are reviewed to improve understanding of the complex process. The 3 basic stages in the dispersion process are wetting, deagglomeration or physical separation of particles by force, and stabilization. The dispersion of pigment as it exists in the cured paint film is very important as a fourth stage but has been neglected. A suggestion is made that a more profitable approach would be to study the end result (dispersion in the cured film) and work backward to find the optimum conditions at the earlier stages. This approach was adopted by the Springdale Research Center and resulted in developing a paint utilizing a new light scattering concept with extraordinary efficiency. (USBR)

CANAL CONSTRUCTION USING ROW CHARGES IN THE EXPLOSIVE EXCAVATION AT ALLARECHENSK MINE,
Soiuzvzryvprom, USSR.
F. A. Avdeev.
Vzryvnoe delo, Sb 61/18, pp 161-175, Moscow, 1966. Transl from Russ, Bur Reclam Transl 773, June 1968. 37 p, 11 fig, 7 tab, append, 2 ref.

Descriptors: *Canals, Explosions, *Explosives, *Excavation, Foreign projects, Charges (Explosives), Soil mechanics, Methodology, *Cratering, Soil liquefaction, Soil structure, Drainage, Moraines, Sand boils, Soil physical properties, Sands, Soil moisture, Pore water pressures.
Identifiers: USSR, Depth, Allarechensk Canal, USSR, Depth of burst, *Explosive excavation, Unstable ground, Spacing, Spaced charges.

A special bureau of explosive experts in the USSR used row-charge explosive excavation to build the Allarechensk drainage canal to drain a mining area in Kirgistan. Design data were: length 4.7 km, width at bottom 5.5 m, bottom slope 0.0015, side slopes 2.5:1, depth 3 to 10 m, and average discharge 27 to 34 cu m/sec. Most of the canal runs through morainic stable soils, but unstable liquefying soils were encountered in one reach. Conclusions were that: (1) the method is feasible for hydraulic structures located away from industrial areas, saving construction time and requiring less equipment; (2) in morainic soils with 30 to 35% boulders, the method excavates a design profile with stable side slopes; (3) in yielding soils, the method enables reductions in labor and time, but more explosives must be used to compensate for inability to place charges at optimum depth; (4) the method can be used in unstable liquefying soils by double explosion, the first to destroy the soil structure and the second to excavate the structure after draining; (5) using war surplus explosives is feasible; and (6) further investigations of explosions for liquefying soils are needed. 9A. Education (Extramural)

A COMPILATION OF WATER RESOURCES RESEARCH AND GRADUATE TRAINING ACTIVITIES AT NEW MEXICO STATE UNIVERSITY,
New Mexico State Univ., University Park.
John W. Hernandez.
New Mexico State Univ, WRRI Publications No 1, 1966. 72 p. OWRR Project A-999-NMex.

Descriptors: Water resources, *Water resources development, Hydrology, Ecology, Research and development, Economics, Hydraulics, Agriculture, Fluid mechanics, Irrigation, Limnology, Water treatment, Water quality, Education.
Identifiers: *Research project notices.

This publication is a summary of active research studies and supported graduate training programs in the water-resource field at New Mexico State University as of July 1, 1966. Training programs receiving outside grants are included in the text as they provide a significant source of funding for graduate students. The current research projects included in the compilation have been classified into subject matter groups shown in the Table of Contents. An index listing authors, research topics, and funding agencies is included. This compilation reflects the magnitude, interest and diversity of water resources research being conducted throughout the University. It will be noted that a number of the studies listed are not funded by the University nor by any outside agency. In general, projects of this nature are in a preliminary development stage or are unsupported student thesis topics. Funded projects are administered through one or more of the following organizations: (1) the Water Resources Research Institute, (2) the Agricultural Experiment Station, (3) the Engineering Experiment Station, and (4) the Research Center.

NEW SERIES

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign); single copy price is $3.00.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY U. OF I. URBANA - CHAMPAIGN

VOLUME 2, NUMBER 3
FEBRUARY 1, 1969

WR 69-00705 -- WR 69-01205

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States--now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF I. URBANA - CHAMPAIGN

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA - CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ANALOG COMPUTER FOR HYDROLOGIC RESEARCH,
Nevada Univ., Reno.
D. F. Schulke, P. A. Domenico, and G. B. Maxey.

Desert Res Inst, Proj Rep 7, Nov 1966. 30 p, 18 fig, 1 tab. OWRR Project B-005-Nev, A-003-Nev.

Descriptors: *Analog models, *Model studies, Synthetic hydrology, *Mathematical studies, *Darcys Law, Fluid flow, *Theoretical analysis, Groundwater, Surface water, Analog computer, Flow.
Identifiers: Hydrologic phenomena, Electrical phenomena, Ohms Law.

When it is possible to find an analogy between one phenomenon and another that is easier to observe, information about the first can be obtained by observing the second. Such an analogy exists between hydrologic phenomena and electrical phenomena. For solution of hydrologic problems two types of analog computers are used: (1) direct or unique analog is used more often for solving ground water problems. It applies the time variant or transient flow of ground water as simulated by the varying flow of current in electricity. This and other hydrologic parameters are simulated by utilization of the analogy between Darcy's Law for flow of fluids and Ohm's Law for flow of electricity; (2) general analog is used more often for surface-water problems and differs from the unique analog in that it is a mathematical rather than a physical analog. It consists of an assemblage of computing elements each capable of some mathematical operation. The analogy between indirect analog and physical system is the equation being solved. Examples of both types of analogs are given. Many surface and ground water problems are thus capable of being analyzed which otherwise would not be attempted due to their complexity and the time normally required for their solution.
W69-00739

THE MECHANISM OF DIRECT SURFACE RUNOFF FROM RAINFALL,
Oklahoma State University, Norman, Agr. Eng. Dept.
Charles E. Rice.
July 1968, 9 p. OWRR Project A-006-Okla.

Descriptors: *Overland flow, *Rainfall-runoff relationships, *Mannings equation, *Darcy-Weisbach equation, Uniform flow, Turbulent flow, Laminar flow, Discharge coefficients, Roughness (Hydraulic), Flume.
Identifiers: *Synthetic grass, Effective bottom.

Research methods are used for developing prediction equations and measuring actual water surface profiles for unsteady spatially varied sheet flow over various surfaces. Procedures for routing various rainfall rates through the sheet flow phase into channel flow are presented. Studies on synthetic grass material show that 2 regimes of flow occur, one when flow depth is less than the height of the grass (laminar flow) and the other when flow depth is greater than grass height (turbulent flow). Because the experimental grass occupied a considerable part of flow depth the physical bottom was assumed as not being representative of the effective bottom. For turbulent flow an effective bottom was determined as the intercept of water surface plotted against discharge to the 0.6 power. The Manning coefficient for turbulent flow range increased a little with discharge and its value (average of about 0.032) indicates that synthetic grass has a high retardance to water flow. (Lang-USGS)

VARIABILITY IN RAINFALL PRODUCING RUNOFF FROM A SEMIARID RANGELAND WATERSHED, ALAMOGORDO CREEK, NEW MEXICO,
Southwest Watershed Research Center, Tucson, Arizona.
J. C. Drissel, and H. B. Osborn.
J Hydrol (Amsterdam), Vol 6, pp 194-201, 1968. 8 p, 6 fig, 4 ref.

Descriptors: Variability, *Runoff, *Rainfall disposition, Watersheds (Basins), Hyetographs, Wet seasons, Hypsometric analysis, Convection, Fronts (Atmospheric), Semiarid climates, Orography, Thunderstorms, *Precipitation intensity, Precipitation gages, *Demonstration watersheds, *Rainfall-runoff relationships, Meteorological data.
Identifiers: Alamogordo Creek (New Mexico).

The study was conducted on the 67 square mile Alamogordo Creek watershed in New Mexico. Rain gage density was approximately one gage for every two square miles. Most winter precipitation occurred as low-intensity rain or snow along slow-moving cold fronts. Summer rains yielded 80% of the annual rainfall and were produced generally by short-duration, high-intensity thunderstorms. Mean annual precipitation for the period (1956-1965) was 11.18 inches, with a standard deviation of 4.92 and median of 10.96 inches. All runoff was produced by summer storms (May through October). Mean annual runoff was 0.37 inches (approximately 20 acre-feet per square mile or 1330 acre-feet), which was 3.3% of the mean annual precipitation. Runoff varied more than rainfall. In 1964 total runoff was only 0.03 inches (107 acre-feet) while in 1960, 2.34 inches (8360 acre-feet) were recorded. About 60% of the total runoff from 1956-1965 was produced in 1960. 93% of the total runoff for the 10 year period occurred during June, July and August. (Blecker-Ariz)

HYDROGEOLOGY OF DESERT BASINS,
Desert Research Institute, Reno, Nevada.
George B. Maxey.
Groundwater, Vol 6, No 5, pp 10-22, Sept-Oct 1968.

Descriptors: *Hydrogeology, *Great Basin, *Nevada, Discharge (Water), Base flow, Geologic investigations, Hydrologic aspects, *Hydrologic budget, Water chemistry, Groundwater basins, Reservoirs, Carbonate rocks, Water resources development, Recharge, *Watersheds (Basins), Drainage patterns (Geologic).
Identifiers: Geologic aspects, *Hydrologic systems, *Regional flow systems, Inter-basin flow, Flow systems.

The hydrologic system of the Great Basin in Nevada was utilized in order to describe salient characteristics of arid basins, to describe some methods used to delineate and defvine hydrologic systems and to demonstrate the importance of ground water reservoirs. Ground water systems of the Great Basin consisted of (1) local flow systems with small drainage areas, short flow paths, rare interbasin flow, large fluctuation of springs discharge, low water temperature and low concentration of Na, K, Cl and SO sub 4 and (2) regional flow systems with large drainage areas, long flow paths, common interbasin flow, large discharge of springs and higher concentrations of K, Na, Cl and SO sub 4. Hydrologic approaches included hydrologic budget, water potential and water chemistry studies. Integration of hydrologic, geologic and chemical methods allowed approximate portrayal of many systems, both local and regional. (Affleck-Ariz)
W69-01013

SOME REMARKS ON NON-DARCY FLOW,
Negev Institute for Arid Zone Research, Beersheba, Israel.
Richard Kraft, and Daniel Yaakobi.
J of Hydrology (Amsterdam), Vol 4, No 2, pp 171-181, June 1966. 11 p, 6 fig.

Descriptors: *Darcy's law, *Hydraulic gradient, Velocity, Permeability, Porosity, *Clays, Discharge measurement, *Theoretical analysis, *Equations, Model studies.

Until recent times, Darcy's law was believed to be valid over the complete range of hydraulic gradients. Instead of discharge velocity being directly proportional to the hydraulic gradient, a nonlinear relationship was found in the low hydraulic existence of non-Darcy behavior revealed that its existence is not firmly supported by experiment. The paper discussed critically four non-Darcy experiments and made suggestions on how they might be improved from an experimental and theoretical viewpoint. There was little agreement as to the theoretical explanation for non-Darcy phenomena. A brief theoretical derivation of Darcy's law was given. A new system for determining permeability was described. Non-Darcy flow was discussed briefly from a theoretical perspective. From theoretical considerations, it was suggested that when future permeability tests are made they cover a wide range of different porosities and clay types with varying Chapman-Gouy potentials. (Blecker-Ariz)

WATER RESOURCES OF EAST-CENTRAL MISSISSIPPI, CLARKE, JASPER, LAUDERDALE, NEWTON, SCOTT, AND SMITH COUNTIES--A PROGRESS REPORT,
U S Geological Survey Jackson Miss Water Resources Div.
E. H. Boswell.
U S Geol Surv open-file rep, 14 p, Aug 1968. 4 fig, 3 tab.

Descriptors: *Water resources, *Groundwater, *Surface waters, Mississippi, Aquifers, Water quality, Water yield, Streamflow, Low flow, Water storage, Water utilization, Reservoirs.
Identifiers: East Central Mississippi.

Data obtained in an investigation of the water-resources potential for industrial development in east-central Mississippi are summarized. The area is deficient in perennial streamflow, and it is drained by no large streams. The headwater tributaries of the Pascagoula, Pearl, and Tombigbee Rivers drain the northern part; the Chickasawhay, Leaf, and Strong Rivers drain the southern part of the area. Base flows in the larger streams are low but well sustained; the smaller streams are intermittent. Surface-water flow from the area at low flow may be as little as 100 mgd. Surface supplies must be enhanced by surface storage. One large reservoir is under construction and others are planned. Artesian aquifers underlie the area, may yield large quantities of water, and are largely unused. The two most important aquifers are the Lower Wilcox, under the NE 85% of the area, and the Sparta sand,

LIBRARY U. OF I. URBANA - CHAMPAIGN

under the SW 80%. Groundwater is soft to moderately hard Na-bicarbonate type at shallow depths, and soft, chloride type with higher total solids deeper. Pollution is a problem only in two creeks in Lauderdale and northern Clarke Counties. (Knapp-USGS)
W69-01031

THEORETICAL CONCEPT OF OXYGEN TRANSFER IN GAS BUBBLE AERATION SYSTEM.
Rhode Island Univ, Kingston.
Calvin P. C. Poon.
Water Resour Center, Completion Rep, July 1968. 11 p, 12 ref. OWRR Project A-015-RI.

Descriptors: *Diffusion, *Aeration, Temperature, Pressure, Flow rates, Turbulent flow, Mathematical models, Oxygen requirements, Gasses, Mass transfer, Bubbles.

A mathematical model was developed for diffused aeration relating the oxygen diffusion coefficient to its controlling factors such as temperature, pressure, bubble size, and rate of air flow. By considering the diffused aeration as a 2-step process, namely molecular diffusion and turbulent diffusion, the model was developed using the principle of statistics of molecular motion as well as a hydraulically defined surface renewal rate. The mathematical model should help engineers and operators in aeration practice to understand and to control better the process.

APPLICATION OF ELECTRONIC ANALOG COMPUTER TO SOLUTION OF HYDROLOGIC AND RIVER-BASIN-PLANNING PROBLEMS: UTAH SIMULATION MODEL II,
Utah State Univ, Logan.
J. Paul Riley, Duane G. Dhadwick, and Jay M. Bagley.
Rep REWG 32-1, Water Res Lab, Oct 1966. 129 p, 41 fig, 9 tab, 52 ref, 2 append. OWRR Project B-005-UTAH.

Descriptors: Surface runoff, Groundwater, *Model studies, *Analog computers, Infiltration, Rainfall, Runoff, Snowmelt, Evapotranspiration, Deep percolation, Precipitation (Atmospheric), Temperature, Hydrologic data, Insulation, Water yield, Water yield improvement, *Hydrology, Research and development, *Water resource development, Soil moisture.

As demand on water supplies increase, there is an accompanying increase in the need to assess consequences resulting from changes at specific locations. At Utah State University this problem is being approached by electronic analog simulation of the hydrologic system. Modeling concepts are based upon development of basic relationships which describe the various hydrologic processes. Within a system, these relationships are linked by the continuity-of-mass principle which requires a hydrologic balance at all points. Once established, the model is applied to any particular geographic unit by determining the appropriate constants of the hydrologic equations. The complexity of a hydrologic model depends largely upon the magnitude of time and spatial increments utilized in the model. In this study the mathematical development was based on the concept of relatively small increments of space and large time increments. The model is therefore applicable to in-basin problems involving a time increment of, for example, 1 month. The Circle Valley subbasin of the Sevier River system was simulated to verify the model. Close agreement between computed and observed outflows was achieved on a monthly and total annual basis.
W69-01145

AN EXPERIMENTAL RAINFALL-RUNOFF FACILITY,
Colorado State Univ, Fort Collins.
W. T. Dickinson, M. E. Holland, and G. L. Smith.
Colorado State Univ Hydrol Pap 25, Sept 1967. 81 p, 13 fig, 4 tab, 255 ref. OWRR Project B-005-COLO.

Descriptors: Artificial storms, *Demonstration watersheds, *Model studies, Overland flow, *Small watersheds, Erosion, Water pollution, *Test facilities, Watersheds, Runoff, Rainfall, Models, Research and development, Bibliographies.
Identifiers: *Rainfall-runoff relation, Research facilities, Hydrologic models.

Part I. An experimental facility is described for investigation of rainfall-runoff relationship. The facility is large enough to respond as a prototype watershed, but small enough to permit controlled variation of watershed characteristics and artificial application of a rainfall. Criteria for the facility are related to: (1) control of reasonably uniform rainfall, (2) measurement of variables, with attention to variations in time and space, and (3) variation of watershed parameters. The experimental facility has potential application in studies of rainfall runoff response, erosion, and travel of pollutants on watersheds. Part II. Design and construction of rainfall-runoff experimental facility is described. Three phases are discussed: (1) site selections, (2) selection of basic geometry of facility, and (3) design and construction techniques of site preparation, methods of precipitation and discharge measurement with automatic digital recording of data, soil surface treatment, and proposed precipitation towers. Part III. A review and appraisal of status of mathematical models of hydrologic watershed response is followed by an annotated bibliography of 226 references relating studies of watershed response.
W69-01162

THE EFFECTS OF GEOGRAPHICAL AND CLIMATIC SETTING ON THE ECONOMIC ADVANTAGES OF ALTERNATIVE FLOOD CONTROL MEASURES,
Kentucky Univ Water Resources Inst, Lexington.
Clyde R. Dempsey.
Kentucky Univ Water Resources Inst Res Rep No 10, 166 p, 1968. 26 fig, 45 tab, 32 ref, 5 append. OWRR Project A-001-Ky.

Descriptors: *Flood control, *Climatology, *Watersheds (Basins), Computer programs, Urbanization.
Identifiers: *Pond Creek, Kentucky, Drainage area.

A joint research project was undertaken to evaluate the effects of climatic setting and geographical location on relationships of flood peaks and flow regime in a given watershed. A previously developed Stanford Watershed Model was applied to a drainage area near Louisville, to illustrate the optimum flood control program in a growing urban area in a humid climate. This general study was done to alleviate flood damages through the construction of structural measures for flood control, since the work already done had not fully achieved its intended purpose. In this joint research project, 2 computer programs were developed to facilitate mathematical steps in the design process to be applied to a particular flood plain. The hydrologic input data required for the computer program involves flood peaks and flood hydrographs as functions of tributary or urbanization, channelization, and drainage area. (Llaverias-USGS)

REVIEW AND ANALYSIS OF RAINFALL AND RUNOFF DATA FOR SELECTED WATERSHEDS IN MINNESOTA,
Minn Univ, Anthony Falls Hydraul Lab, Minneapolis.
C. Edward Bowers, and Arthur F. Pabst.
Minn Univ St Anthony Falls Hydraul Lab Proj Rep No 97, 32 p, June 1968. 55 fig, 8 photo, 9 tab, 10 ref, 5 append. OWRR Project A-013-Minn.

Descriptors: *Rainfall-runoff relationships, *Depth-area-duration analysis, *Discharge (Water), Mathematical models, Flood routing, Minnesota.

Available rainfall and runoff data for selected watersheds in Minnesota were analyzed to assist in the evaluation of peak rates of runoff for design purposes; 6 watersheds were selected for study. Rainfall and runoff data were analyzed for 51 flood events in 5 of 6 watersheds. A computer program prepared by the U S Army Corps of Engineers Hydrologic Engineering Center was used to optimize 9 variables associated with the watersheds, develop characteristic unit hydrographs, and evaluate loss rates for the watershed in terms of the mathematical model represented by the optimization program. Data on annual maximum floods as well as maximum summer floods were plotted on log-probability paper and theoretical flood-frequency curves determined by the log-Pearson Type III distribution. Approximately 200 figures relating to the rainfall-runoff data have been included in the appendices. (Knapp-USGS)

2B. Precipitation

AN INVESTIGATION OF SOME PRECIPITATION PATTERNS OF CALIFORNIA AND ADJACENT REGIONS,
California Univ., Los Angeles.
Charles B. Pyke.
Water Res Center Rept, Apr 1966. 111 p, 18 fig, 13 tab, 45 ref, append. OWRR Project A-016-Cal.

Descriptors: *Atmospheric precipitation, *Rainfall, Meteorology, *Investigations, Climatology, Correlation techniques, Seasons, Seasonal, Precipitation (Atmospheric), Correlation analysis, California.

A detailed study of geographical and seasonal distribution of precipitation patterns over the far western U S reveals interesting and complicated features and aids in understanding the large-scale synoptic meteorological processes responsible for production of precipitation. Climatic fluctuations and short-term climatic changes taking place in the precipitation patterns over the region are also studied, and an attempt is made to relate changes in precipitation patterns to changes in atmospheric circulation patterns. Monthly totals of precipitation for 57 selected stations within the region of investigation were used as the data for this project; and computations of seasonal totals and averages over 5- to 30-yr periods were made for all of these data. Definite climatic fluctuations of relatively short duration (10-30 yr) are observable from the computations. In addition a slight overall downward trend in the annual total of precipitation, particularly since 1915, is visible in southern California and along the coast of central California.

LA TEMPORADA DE CICLONES DE 1967 Y SU CONTRIBUCION A LA PRECIPITACION ANNUAL EN MEXICO (The Hurricane Season of 1967 and the Contribution to the Annual Rainfall in Mexico),
Mexico, Del Instituto de Geografía UNAM.
O. E. Jauregui.
Ingenieria Hidraulica en Mexico, Vol 22, No 2, pp 169-176, 1968. 8 p, 4 tab, 2 fig, 3 photo, 5 ref. (Transl. from Spanish by Rita Llaverias).

Descriptors: *Cyclones, *Precipitation excess, *Flood damage, *Mexico, Wind velocity, Soil moisture, Hurricanes, Arid lands, Gulf of Mexico.
Identifiers: *Cyclone, *Beulah, Satellite.

The contribution of the 1967 tropical cyclone season to the annual precipitation in Mexico is reported. Beulah, with winds reaching 190 km/hr, caused damage in Mexico equal to that done by Betsy in Louisiana (Sept 1965). Damage caused by Beulah from Martinique to the Tamaulipas border was estimated at 1,000 million dollars. Formed in the Lesser Antilles, Beulah first battered Martinique. Entering the Caribbean south of Puerto Rico, it touched the Dominican Republic, passed over Haiti, and skirted Jamaica at which point winds grew in intensity up to 190 km/hr. Then

cyclone Beulah hit Mexico. Heavy rains accompanying the hurricane caused numerous floods through half of the country. Nonetheless, these torrential rains made 1967 a good year for arid and semi-arid lands in Lower California and around the Lower Bravo River (Rio Grande). Such phenomena transport much humidity and supply the convective processes necessary to convert moisture into rainfall. A table and a map show numerical values for the contribution of precipitation in selected areas. Other tabular data indicate that rain from tropical cyclones contributes from 13 to 41% of total precipitation along the Atlantic Coast and Gulf of Mexico. Biological and socio-economic aspects involved in modifying the weather are also briefly discussed. Photos of the tropical cyclone made from a satellite show size, shape, and location at different times. (Llaverias-USGS)

RADAR ESTIMATION OF RAINFALL,
New Zealand Meteorological Service, Wellington.
A. P. Ryan.
J Hydrol (New Zealand), Vol 5, No 2, pp 100-110, 1966. 11 p, 3 fig.

Descriptors: *Rainfall, *Radar, *Weather patterns, *Raingages, Measurement, Equations, *Raindrops, Instrumentation, Remote sensing, Calibrations, Meteorology, Wavelengths.
Identifiers: *Reflectivity.

Preliminary results of using radar to estimate rainfall at Ohakea, New Zealand were given. The radar was calibrated and stability was found satisfactory for short and long periods. Eight recording raingauges were set up in an area of 24 square miles. The area was 14 miles from the radar, and a good line-of-sight visibility was present. All three trials were done on occasions of patchy, mainly light rain and individual rain areas were small. Quantitative radar rainfall measurements were feasible with an accuracy at least as good as that of conventional raingauge networks in most areas. Even in the case where the radar estimate is less accurate than that obtained from the existing raingauge network in arid areas, it has an advantage in that it becomes available as the rain falls and includes valuable data on size and movement of rain areas. TIME DISTRIBUTION OF RAINFALL IN HEAVY STORMS,
Illinois State Water Survey, Urbana.
F. A. Huff.
Water Resources Res, Vol 3, No 4, pp 1007-1019, 1967. 13 p, 8 fig, 8 tab, 8 ref.

Descriptors: *Rainfall, *Rainfall disposition, *Storms, Hyetographs, Histograms, Synoptic analysis, Statistical models.
Identifiers: Rainfall time distribution.

Time distribution relations have been developed for heavy storms on areas ranging up to 400 square miles and presented in probability terms to provide quantitative information on interstorm variability and to provide average and extreme relations for various applications of the findings. It was found that the relations could be represented best by relating per cent of storm rainfall to per cent of total storm time and grouping the data according to the quartile in which rainfall was heaviest. The individual effects of mean rainfall, storm duration, and other storm factors were small and erratic in behavior when the foregoing analytical technique was used. Basin area had a small but consistent effect upon the time distribution. The derived relations are applicable to the Midwest and other areas of similar climate and topography. They can be used in conjunction with published information on spatial distributions and other storm parameters to construct storm models for hydrologic applications. (Author)

PATTERN OF PRECIPITATION DISPERSION AS AFFECTED BY DIFFERENT VEGETATIVE COVERS IN MAINE,
Maine Univ, Sch of Forest Resources, Orono.
Charles E. Schomaker.
Includes papers from Maine Farm Res Quart, Vol 15, No 2, July 1967, and from Forest Sci, Vol 14, No 1, pp 31-38, Mar 1968. Water Resources Res Proj Completion Rep, 18 p, July 1968. 7 fig, 2 tab, 17 ref. OWRR Project A-005-ME.

Descriptors: *Interception, *Water loss, *Birch trees, *Coniferous trees, Maine, Stemflow, Snow, Rain, Solar radiation.
Identifiers: *Precipitation dispersion.

The interception of precipitation by conifer and hardwood stands was measured and compared. The conifer stand has a basal area of 140 sq ft per acre and a crown coverage of 75-80%. The overstory trees are 88% spruce with an average diameter of 9 in. The remaining 12% of the overstory is white pine with diameters of 16 in. or more. The hardwood stand is 68% white birch, 22% red maple, and some beech and hemlock. Diameters average 5-6 in. Basal area is 100 sq ft per acre, and crown coverage is 80-85%. Precipitation was 35.65 in. from 79 storms. Snow fell in 21 of the storms. The spruce intercepted 35.5% and the birch, 17.9%, and in both stands, winter interception was higher. The birch intercepted about the same percentage in winter and summer, but the spruce intercepted significantly more in winter. Precipitation and interception data are tabulated. (Knapp-USGS)

ATMOSPHERIC PROCESSES INVOLVED IN PRECIPITATION,
Alaska Univ., College.
Takeshi Ohtake.
Inst of Water Resour Rept 1968. 14 p, 16 fig, 3 tab, 8 ref. OWRR Project A-001-Alas.

Descriptors: *Ice, *Water vapor, Ice-water interfaces, *Fog, *Alaska, Cryology, Crystal growth, Air pollution, Air temperature, Moisture uptake, Atmospheric physics, Precipitation (Atmospheric), Drops (Fluid), Arctic.
Identifiers: Ice fog, Ice crystals.

This study began in the fall of 1964 in the Fairbanks area of Alaska. It involves an inquiry into sources and role of water vapor in ice fog, investigation of the relative concentrations of ice-fog particles, ice nuclei and condensation nuclei, and examination of the characteristics of nuclei and crystals by electron microscopy. With the electron microscope it was found that most nuclei of ice crystals which developed from sublimation of water vapor were located at the center of the ice crystals. In contrast, ice-fog particles result from freezing of super-cooled water droplets which form by condensation of water vapor from man-made sources of air pollution such as exhaust gases, open water surfaces on cooling pond, etc. The nuclei in these particles are not located in the center. Dense ice fog covering small areas originated from open water where the condensation nuclei concentration was much lower than in the downtown area, while thin but widespread ice fog was observed in the downtown area and along the highway. Dense ice fog was associated with large sources of moisture regardless of whether or not nuclei were abundant. The role of ice-forming nuclei and a preliminary consideration of synoptic conditions which cause ice fog is also discussed.

PREDICTION OF BEGINNING AND DURATION OF ICE COVER,
Colorado State Univ., Fort Collins.
John C. Ward.
Sanit Eng Pap No 2, Sept 1966. 34 p, 6 fig, 7 tab, 14 ref. OWRR Project A-003-Colo.

Descriptors: Surface waters, Temperature, *Oxygen demand, Thermal pollution, Sanitary engineering, Navigation, Fish, Water cooling, *Ice.
Identifiers: *Ice cover, Stream reaeration.

Ice cover is related to the capacity of streams to assimilate wastes because it cuts off air contact, and winter conditions may, in certain circumstances, produce greater oxygen deficits than summer conditions, in spite of the slower rates of deoxygenation and the higher oxygen saturation values of cold waters. The annual variation of stream water temperature can be well represented by a sine curve for most streams. However, streams in cold regions may be frozen over for as much as six months per year. In order to represent the annual variation of stream water temperature for these streams, a modification of the sine curve is necessary. The validity of the modified curve for streams that are frozen over for a portion of a year is indicated in that the duration and beginning date of ice cover is reasonably well predicted, and the stream water temperatures for the rest of the year are also predicted with a fair amount of accuracy. The effects of thermal pollution on the sine curve are reviewed, and the possible effect on ice cover is indicated. The possible application of the sine curve to lakes and reservoirs is illustrated. WATER TEMPERATURES IN A SHALLOW LAKE DURING ICE FORMATION, GROWTH, AND DECAY,
U. S. Army Cold Regions Research and Engineering Laboratory, Hanover, New Hampshire.
Michael A. Bilello.
Water Resources Res, Vol 4, No 4, pp 749-760, Aug 1968. 20 p, 13 fig, 21 ref.

Descriptors: *Iced lakes, *Ice, *Ice-water interfaces, *Water temperatures, Limnology, Melting, Thawing, Melt water, Michigan, Heat budget.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Identifiers: Seneca Lake, Ice formation, Shallow lake, Iceathaw periods, Ice decay.

Water temperature variations were measured continually and automatically recorded at Seneca Lake, near Houghton, Michigan, during conditions of ice formation, growth, and decay. A minimum of 0.2 deg C was recorded from just below the surface to the bottom of the lake before complete freeze-over occurred. The water temperature near the bottom of the lake increased from 0.3 to 3.0 deg C. A quantitative analysis of this heat gain attempts to show that most of the heat resulted from energy stored during the summer in the underlying soils. During the April ice-thaw period, the temperature throughout the main mass of water decreased substantially. Since the lake until this time was in a state of quasi-stable thermal stratification, it was assumed that this cooling resulted from the mixing of meltwater flowing into the lake from the surrounding snow. The sudden decrease in water temperatures coinciding with above-freezing air temperatures may be due to these physical processes: (1) near-freezing water released at the underside of the ice sheet as the ice melts; (2) ponding of melt water on the surface of the lake; (3) gravity flow of snow melt water (less than 4 deg C) from around the lake. WATER COOLING AND ICE THICKENING ON DINGMAN CREEK, NEAR LONDON, ONTARIO,
Alberta Univ, Edmonton, Canada.
Edward S. Spence.
Ontario Geogr, No 2, pp 49-66, 1968. 3 fig, 2 tab, 14 ref.

Descriptors: *Freezing, *Streams, *Water temperature, Correlation analysis, Air temperature, Humidity, Solar radiation, Streamflow, Wind velocity, Regression analysis.
Identifiers: Ontario.

The freezing processes of 2 small streams, near London, Ontario were studied by collecting a complete hourly record of air temperature and relative humidity from Nov 11, 1966 to Feb 28, 1967 partial records of sunshine and wind, daily water temperature data from 12 thermocouples at 1 ft intervals in a pond on one of the creeks, and daily water temperature taken in a turbulent stretch of the stream. Ice thicknesses were measured and daily mean ice thickness was calculated. Multiple correlation and regression techniques were used to relate water temperature, the dependent variable, to air temperature, humidity, sunshine, wind, and discharge. Ice thickness growth may be related to the variables by 2 equations with predictive potential, but data must be collected for several more seasons before they can be accurately evaluated. (Knapp-USGS)

2D. Evaporation and Transpiration

WATER LEVEL FLUCTUATION IN EVAPOTRANSPIROMETERS,
U. S. Geological Survey, Phoenix, Arizona, Water Resources Division.
T. E. A. Van Hylckama.
Water Resources Res, Vol 4, No 4, pp 761-768, Aug 1968. 5 fig, 24 ref.

Descriptors: *Water level fluctuations, *Evapotranspiration, *Instrumentation, Water balance, Arizona, Water levels, Groundwater, Soil moisture.
Identifiers: *Evapotranspirometer tanks, *Saltcedar.

To measure the water use by saltcedar, and to compare the quantities measured with those computed by various empirical and physical methods based on meteorological phenomena, 11 plastic-lined evapotranspirometer tanks were constructed near Buckeye, Arizona. Artificially maintained groundwater levels show distinct diurnal fluctuations in these instruments. On bare tanks or on vegetated tanks that are not transpiring, this fluctuation is highly correlated with diurnal and semidiurnal atmospheric fluctuations. Possible reasons for such response are discussed: (1) There might be air bubbles in the saturated zone; (2) It might be caused by the flexible plastic lining of the tank. Barometric efficiency is about 40%. On vegetated tanks that are transpiring, the water level and barometric curves are out of phase, but if the water levels are corrected for atmospheric pressure fluctuations, a curve appears that represents the hourly rate of water use. The graphs presented show how diurnal atmospheric pressure effects can be masked and yet can have influenced the water level in transpiration wells. The results may be important in the interpretation of transpiration well data. (Llaverias-USGS)

ESTIMATING EVAPOTRANSPIRATION IN A HUMID REGION,
Board of Agriculture, Helsinki, Finland, and Soil and Water Conservation Res Div, Agricultural Research Service.
Seppo E. Mustonen, and J. L. McGuinness.
U S Dep of Agr Tech Bull No 1389, 123 p, July 1968. 42 fig, 22 tab, 57 ref.

Descriptors: *Cover crops, *Evapotranspiration, *Humid areas, *Statistical models, *Watersheds (Basins), Lysimeters, Soil moisture, Water balance, Precipitation (Atmospheric), Solar radiation.
Identifiers: *Potential evapotranspiration, Scale weight lysimeter readings, Water budget.

An investigation was made of the problem of estimating evapotranspiration in a typical humid region with an abundant and evenly distributed monthly precipitation. Evapotranspiration models were derived from data obtained through large weighing lysimeters for which moisture storage change data were available. The models were then applied on natural watersheds to check the appropriateness of the models and to derive coefficients for use in watershed studies. Evapotranspiration data obtained this way was related to climate and water availability by the use of statistical models derived by multiple regression. The influence of evapotranspiration of different plant covers on watersheds was studied. Climatic variables used in computing daily lake evaporation were mean daily air temperature, mean daily dew point temperature, daily windspeed, and daily solar radiation. Scale weight readings from the lysimeter were correlated with neutron scattering and gypsum block measurements outside the lysimeter to obtain yearround estimates of daily soil moisture. Lysimeter evapotranspiration data obtained from these formulas were somewhat higher than those obtained from natural watersheds. (Llaverias-USGS)

PILOT EVAPOTRANSPIRATION STUDY: LYSIMETER DESIGN,
Hawaii Univ., Manoa.
Paul C. Ekern.
Tech Rep 13, Water Resour Res Center, Aug 1968. 26 p, 8 fig, 53 ref. OWRR Project A-010-Hi.

Descriptors: *Lysimeters, Equipment, Evaporation, *Evapotranspiration, Hydrologic cycle, Micrometeorology, Winds, *Fine-textured soils, *Soil water, Moisture availability, Soil temperature, *Consumptive use, Water requirements, Pressure measuring instruments, Tensiometers, *Sugarcane.

Based on field experience with hydraulic lysimeter for the evapotranspiration of pineapple, nylon reinforced butyl rubber bolsters formed hydraulic load cells to support 3 by 3 by 1.52-m-deep filled lysimeter for sugarcane. Stability was achieved by placing several of the bolsters at right angles to the others. Polyester resin, fiber glass reinforced tanks have paper honeycomb strengthened bottoms. Large tensiometers of Povic membrane were used to remove percolate to simulate field capacity of 0.1 bar in the low humic latosol. The open end manometers used for measurement of pressures in the cells must be protected from wind and temperature fluctuations.

DIFFUSION THROUGH MULTIPERFORATE SEPTA,
Richard Lee.
Water Resour Inst Rep, Conn A-002, June 1966. 4 p. OWRR Project A-007-Conn.

Descriptors: *Transpiration, *Stomata, Diffusion, Plants, *Leaves, *Plant physiology, Respiration, Biological membranes, Evapotranspiration.

Theories were tested on the dependence of membrane diffusion rates on pure size and number over the range of variables characteristic of leaf epidermis. Plant canopies are not passive evaporating surfaces. The regulation of water loss from plants is an important function of leaf stomata, and significant stomatal regulation occurs throughout the range of leafpore diameters. Leaf pores do not significantly interfere with one another in conducting water vapor or other gases. The diffusive conductance of small pores is more sensitive to diameter changes at larger apertures, permitting carbon dioxide exchange for photosynthesis without dehydration of the leaf mesophyll. In still air the external resistance over broad leaves limits control by stomata, but light drafts minimize this effect in field situations. Characteristic diffusion coefficients for leaf types, based on a careful study of leaf microstructure, physiology, and seasonal variation, is a rational basis for cover-type conversions or biochemical controls to reduce water loss.

THE AVAILABILITY OF SUB-SURFACE WATER IN MISSOURI FOR CONSUMPTIVE USE BY PLANTS,
Missouri Univ., Columbia, Soils Dept.
C. L. Scrivner, and Wayne L. Decker.
See also, Decker, Wayne L., 'Potential Evapotranspiration in Humid and Arid Climates,' reprinted from Conf Proc, Evapotranspiration and its Role in Water Resources Management, Dec 5-6, 1966. pp 23-26. Termination Rep, Nov 22, 1967. OWRR Project B-005-Mo.

Descriptors: Alluvium, Soil types, Water storage, *Evapotranspiration, Irrigation requirement, Irrigation effects, *Soil surveys, Climatology, Water requirements, Laboratory tests, Moisture uptake, Moisture content.
Identifiers: Soil maps, Missouri River Basin.

Using a reconnaissance technique which was developed for rapid and preliminary soil survey work, soil types from over 400,000 acres of land in the alluvium along the Missouri river were identified. Boundaries for each soil type are shown on maps in the appendix of this report and acreages associated with each soil type are also listed in the appendix. Concurrent laboratory examinations provided estimates of the water-holding capacities for each of the soil types. Less than 5% of the area had low storage capacities; while 60% of the area had storage capacities in excess of 6 in. of available water in the top 4 ft of soil. The requirement for irrigation of each soil was estimated. Using data from weather stations of the area, the requirement was obtained by simulating the daily water balance of each soil from measurements of rainfall and estimates of evapotranspiration. Soils with low storage capacities need more irrigation than those with high capacities. An attached reprint shows more than 10 in. of supplemental water required for 4 yr out of 10 for the former soil and less than 2 yr out of 10 for the latter soil types.

AN APPRAISAL OF ADVECTION CONTRIBUTIONS TO OBSERVED EVAPORATION IN AUSTRALIA USING AN EMPIRICAL APPROXIMATION OF PENMAN'S POTENTIAL EVAPORATION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia), Div of Land Research.
Eugene A. Fitzpatrick.
J Hydrol (Amsterdam), Vol 6, No 1, pp 69-94, January 1968. 26 p, 10 fig, 5 tab, 33 ref.

Descriptors: *Evaporation, *Vapor pressure, *Temperature, *Climatic data, Diurnal, Advection, Humidity, Arid lands, Correlation analysis, Radiation, Regression analysis, Energy, Evapotranspiration, *Approximation method, Regional analysis.
Identifiers: Western Australia, Tank evaporation, Energy balance, *Penman's potential evaporation.

A method was developed for obtaining an approximation of Penman's potential evaporation using data obtained in field studies of growth and water-use characteristics of cotton at Kununurra, Western Australia. Using daily data, a distinctive linear relationship between the weighted vapor pressure deficit and Penman evaporation was identified for periods with low advection. Reasonable close approximations of Penman's potential evaporation over periods of 10 days or longer could be made solely from temperature and vapor pressure data over a wide range of climatic environments in Australia. A regional appraisal of advective contributions to the observed or estimated rates of tank evaporation using energy balance considerations was difficult in Australia because of the paucity of radiation (or sunshine) and evaporation measurements over large parts of the continent. ROLE OF ANTITRANSPIRANTS WITH SPECIAL REFERENCE TO WATER TURN-OVER IN ARID PLANTS,
Central Arid Zone Research Institute, Jodhpur, India.
A. N. Lahiri.
Annals of Arid Zone, Vol 5, No 1, pp 97-104, March 1966. 8 p, 1 tab.

Descriptors: *Water loss, Arid lands, *Desert plants, *Transpiration control, Photosynthesis, Soil-water-plant relationships, soil moisture, *Retardants, Monomolecular films, Evaporation control.
Identifiers: *Antitranspirants.

Water loss by transpiration under desertic conditions is a serious problem because of the great bulk that is lost to the atmosphere. A review of various antitranspirants with particular reference to water turn-over in arid plants is given. The requirements for a successful antitranspirant are listed. The effect of antitranspirants on photosynthesis were discussed. It was suggested that plant antitranspirants have a great possibility for moisture conservation in arid and semi-arid areas where native plants commonly transpire at a very fast rate until low soil moisture reduces the rate of transpiration. (Affleck-Ariz)
W69-01020

A TECHNIQUE TO DETERMINE EVAPORATION FROM DRY STREAM BEDS,
Ariz. Univ., Tucson. Institute of Atmospheric Physics.
Michael J. Fox.
J of Applied Meteorology, Vol 7, No 4, pp 697-701, Aug 1968. 4 p, 5 fig.

Descriptors: *Evaporation, Dry seasons, *Streambeds, Thermometers, Temperature, Winds, *Hydrologic budget, Anemometers, Energy budget, *Equations, Meteorological data, *Statistical methods, Soil moisture, Water balance, Lysimeters.
Identifiers: Hydrologic balance.

In the desert southwest washes or dry stream beds are numerous. For one or two days after thunderstorm flooding, up to 7 mm. of water evaporates each day. While insignificant in a limited area and time, this evaporation, when totaled over a large area and long period, may be important in the hydrological balance of arid regions. A technique is described to determine 24 hr. stream-bed evaporation subject to the constraints that it be inexpensive, uncomplicated, and accurate to within plus or minus 20%. The result of statistical evaluation of the prediction equation on the experimental data gave an average percentage error of 13% and a standard error of 0.88 mm. (Affleck-Ariz)

LYSIMETER AND WATERSHED EVAPOTRANSPIRATION,
Board of Agriculture, Helsinki, Finland, and Agricultural Research Service, Coshoeton, Ohio.
Seppo E. Mustonen, and J. L. Mc Guinness.
Water Resources Res, Vol 3, No 4, pp 989-996, 1967. 8 p, 2 fig, 3 tab, 12 ref.

Descriptors: *Evapotranspiration, *Lysimeters, *Statistical models, Regression analysis, Hydrologic budget, Small watersheds.

A statistical model was derived by regression analysis for permanent grass lysimeter evapotranspiration, using lake evaporation, soil moisture, and precipitation as independent variables. Measured evapotranspiration was greater than values estimated from water budgets on small watersheds. Differences for permanent grass and grain crops were greatest at planting time when the ground was bare. Evapotranspiration was about 1/2 of normal when hay was cut; it returned to normal in about a month. Reforestation increased evapotranspiration about 35% on a reforested study plot. (Knapp-USGS)
W69-01054

GENERALIZED ESTIMATES OF FREE-WATER EVAPORATION,
Weather Bureau, Washington, D. C. and Agricultural Research Service, University Park, Pa.
M. A. Kohler, and L. H. Parmele.
Water Resources Res, Vol 3, No 4, pp 997-1005, 1967. 9 p, 7 fig, 1 tab, 27 ref.

Descriptors: *Evaporation, *Reservoir evaporation, *Lakes, Mass transfer, Energy budget, Environmental effects, Solar Radiation, Temperature.

A modified method for deriving free-water evaporation estimates from network observations of air temperature, dew point, wind movement, and incoming minus reflected radiation is presented. Taking into account the difference between air and water temperature in computing emitted radiation from the water surface, the expression is an improvement over the original Penman type equation where observation of net radiation over the actual water surface is lacking. The accuracy of the method depends on the applicable mass transfer wind function. Techniques are derived to adjust for the effects of advected energy and heat storage when applying the free-water evaporation estimate to actual water bodies. Computations of lake evaporation made with the modified method for a number of locations where verification data are available indicate that the relation provides a suitable basis for estimating actual evaporation without the expense of continuous over-water observations. THE HYDRODYNAMIC AND ENERGY BUDGET ASPECTS OF PAN EVAPORATION.
Cornell Univ, Ithaca, N Y.
Wilfried Brutsaert.
Tech Rep 7, Water Resour Center, Aug 1967. 38 p, 1 fig, 13 tab, 23 ref. OWRR Project A-004-NY.

Descriptors: *Evaporation, Evapotranspiration, *Evaporations pans, Transpiration, Mass transfer, Solar radiation, Wind velocity, Winds, Shear stress, *Energy budget, Diffusion, *Hydrodynamics.

An analysis is presented of experimental evaporation data which were obtained with shallow, square pans of different sizes and colors. The results are given of the computations of regression analysis relating evaporation with the difference between the water vapor pressure at the water surface and in the air, pan size, wind speed at various elevations and shear stress. These relationships are expressed by different equations for mass transfer whose functional form is widely accepted in the literature or derivable by means of theoretical diffusion models. The shear stress--or the friction velocity--was calculated in 4 different ways, namely by solving the following wind speed profile laws with wind speed data at different elevations; the logarithmic, the log-linear, the log-square root and the log-exponential law. A comparison is presented of the correctness of fit obtained with the different models.

Water Resources Res, Vol 3, No 4, pp 975-988, 1967. 14 p, 13 fig, 3 tab, 20 ref.

Descriptors: *Atmospheric physics, *Radiation, *Evapotranspiration, Energy transfer, Meteorology, Hydrology, Data collections, Humidity, Snowmelt, Instrumentation.
Identifiers: *Atmospheric radiation, Energy balance, Data network.

The application of a complete energy balance to computations of evaporation or snowmelt requires radiation data, of which there is presently reasonable coverage from a network of incident solar radiation stations. A network of all-wave radiometers does not exist. Therefore, to apply the energy budget technique to hydrological problems, incident long-wave radiation must be estimated. An empirical equation is developed by which incident long-wave radiation can be computed from observations of surface air temperature, vapor pressure, and incident solar radiation. Comparisons of estimated and observed incident long-wave radiation at 6 sites lead to the following conclusions: (1) The equation should give results comparable within a few percent on a 6-months basis or longer; (2) For any specific atmospheric condition, there seems to be no tendency for the equation to over or under compute or give increased scatter; (3) When data

LIBRARY U. OF I. URBANA - CHAMPAIGN

for 6 months or more are analyzed, correlation coefficients of about 0.90 were obtained between computed and observed daily radiation values. (Lang-USGS)

HYDROLOGICAL DATA AND PEAK DISCHARGE DETERMINATION OF SMALL HAWAIIAN WATERSHEDS: ISLAND OF OAHU,
Hawaii Univ., Honolulu.
Wu I-Pai.
Water Resour Res Center Tech Rep 15, Dec 1967. 97 p, 26 fig, 13 tab, 46 chart, 43 ref, append. OWRR Project B-003-Hi.

Descriptors: *Watersheds, Overland flow, Rational formula, Surface runoff, *Rainfall, Streamflow, Design criteria, *Hydrology, Flood forecasting, Geomorphology, Soil structure, Land utilization, Rain gages, Runoff forecasting, Stream gages.
Identifiers: *Flood hydrology, Flood frequency, Multiple regression, Flow estimate, Hawaii, Oahu.

Basic hydrological data including rainfall, runoff, historical flood, watershed characteristics, soil type, and land use of Hawaiian small watersheds on Oahu have been compiled and analyzed. Frequency analysis for annual peak discharge was made for 23 small watersheds on Oahu by using Gumbel's extreme value theory. A regional flood formula has been derived for Honolulu and between mountain ranges of the island of Oahu through the use of multiple regression. The regional flood formula expressing peak discharge as a function of watershed area, length and height and a precipitation index defined as 100-yr, 24-hr rainfall in in. can be used to estimate peak discharges for ungaged areas. The rational formula which is currently used for drainage areas less than 100 acres has been evaluated through the study of overland flow.

RECESSION CHARACTERISTICS OF IOWA STREAMS: PART I - TEMPORAL AND AREAL DISTRIBUTION OF RECESSION CONSTANTS,
Iowa State Univ., Ames.
J. W. Howe.
Water Resour Res Inst Rept, June 1966. 150 p, 144 fig, 1 tab. OWRR Project A-004-Ia.

Descriptors: *Streams, *Streamflow, Forecasting, Irrigation, Water users, *Streamflow forecasting, Hydrometeorological station, *Iowa, *Low flow, *Recession curves, Summer, Withdrawal.

This report covers behavior of Iowa in low-water periods during the crop-growing season, May to Sept inclusive. All such periods of 10 days or more in length were analyzed to determine the recession constants. Results are shown on a map of the State and indicate a considerable uniformity of behavior during each of the summer months. Data contained in this report should enable prediction of groundwater streamflow with reasonable accuracy for a period of 1 to 2 weeks in advance if no rain falls, and thus make it possible to give an irrigator several days to a week's notice of the time when the withdrawal from a stream must be terminated. This phase of the project discovers a consistency of recession coefficients at existing stream gaging stations in the summer months which should be useful in predicting the time of occurrence of particular low-water flows. The second phase of investigation will deal with the relation of magnitude of low-water flow at the beginning of a period of recession to associated parameters such as basin area, antecedent rainfall, and soil types.

PLANFORM ANALYSIS OF MEANDERING RIVERS,
Purdue University, Lafayette, Indiana.
G. H. Toebes, and T. P. Chang.
Purdue Univ Eng Reprints CE 242, pp 362-369, Feb 1968. 8 p, 5 fig. OWRR Project A-003-Ind.

Descriptors: *Meanders, *Time series analysis, Frequency analysis, Discharge (Water), Width, Streamflow, Hydraulic similitude, Hydraulic properties.
Identifiers: Ergodic properties.

The planform of meandering rivers is analyzed statistically to improve the analyses made by deterministic approaches and to gain an idea of the relative significance of deterministic and random planform components. The White River Valley in Indiana was selected for a field study and time-series analysis. The data appeared to be non-stationary and spectral characterization of meander planform is likely to require trend removal. A substantial random component is present and the relation between hydrology and meander shape is equally random. Cross-correlation of local planform with local width, depth, slope, and other local factors appears necessary, but these dimensions are difficult to measure reliably. Time trends in river hydraulic behavior are also unpredictable but necessary to define. So far, results show that the search for deterministic equations may be futile. (Knapp-USGS)

SOME RECENT STUDIES ON NUMERICAL FLOOD ROUTING.
North Carolina State University, Raleigh.
Michael Amein.
3rd Annual Amer Water Resources Conf Proc, pp 273-284, Nov 8-10, 1967. 6 fig, 11 ref.

Descriptors: *Flood routing, *Flood forecasting, *Mathematical studies, *Digital computers, Hydrographs, Unsteady flow.
Identifiers: Numerical flood routing.

The results of an investigation of fundamental aspects of numerical flood routing based on the solution of the equations of unsteady flow are presented. Brief reviews of the approximate methods and their solutions, and discussions of the explicit method, the characteristic method, and the implicit method, including factors affecting the stability and accuracy of the solutions, are given. An example of a flood flow problem is solved using the IBM 360 computer. The times of arrival and the depth values of flood peaks calculated by the various methods are essentially the same. The explicit method is the least efficient in computer time, but the simplest to use. (Knapp-USGS)

STREAM TEMPERATURE STUDY, NORTH FORK SNOQUAIMIE RIVER, WASHINGTON,
Washington Univ., Seattle, Civil Eng. Dept.
Ronald E. Nece.
Tech Rep 23, Dep Civ Eng, 1967. 49 p, 9 fig, 3 tab, 11 ref. OWRR Project A-012-Wash.

Descriptors: Heat budget, Solar radiation, Air temperature, *Water temperature, Hydrology, *Rivers, Running waters, Hydrologic data, Hydrometeorological station, Stream flow records, Streams, Temperature.
Identifiers: *Micrometeorology, Snoqualmie River, Wash.

The upper basin of the North Fork of the Snoqualmie River was used for a study of stream temperatures in the headwater regions of a typical Pacific Northwest mountain river. Water temperature, stream flow, and climatological data are given for the heating season of calendar year 1967. A simplified procedure is suggested for predicting water temperatures at a given station on such a stream. The suggested procedure uses a typical heat energy-budget approach; a number of terms usually considered in heat budget calculations are omitted, while provision is made for consideration of remains to be verified because stream travel times required in the calculations have yet to be obtained on the study river. Measurements of air temperatures and of solar radiation in the test basin indicate that these variables may indeed be satisfactorily predicted on the basis of conventional data obtained at the federal weather station in the same general region.

SEQUENTIAL STUDY OF DESERT FLOODING IN THE WHITE MOUNTAINS OF CALIFORNIA AND NEVADA,
Montana Univ., Missoula, Dept. of Geography.
Chester B. Beaty.
U. S. Army NATICK Laboratories, Natick, Mass., Tech Rept ES-37, January 1968. 98 p, 55 fig, 1 map, 11 tab, 21 ref, 1 append.

Descriptors: Canyons, Deserts, *Cloudburst, California, Channel morphology, Alluvial channels, *Debris avalanches, Flood forecasting, *Flash floods, Nevada, Snowmelt, Flood plains, Rainfall-runoff relationships, Wet seasons, *Intermittent streams, *Geomorphology, Storm runoff, Streams.
Identifiers: White Mountains, California and Nevada, Alluvial fans, Trunk canyons.

Study of desert flooding and circumstances under which it is likely to be a hazard to activities in and near desert mountains was undertaken in 1956-57 in the White Mountains of California and Nevada. Ten years later the area was restudied to determine extent and nature of land form changes that had occurred during the intervening decade. Three physiographic characteristics influence flooding behavior in a desert stream system. They are: truck canyon profile, amount of debris on the floor of the trunk canyon and the width of the lower canyon and canyon mouth. The area of greatest flooding danger on a desert alluvial fan is a radial zone extending from the apex toward the margin, flanking and including the active channel. (Blecker-Ariz)

ANALYSIS OF RELATIONSHIPS BETWEEN WATER DISCHARGES AND LEVELS DURING THE PROPAGATION OF RELEASE WAVES IN A PRISMATIC CHANNEL (NUMERIC EXPERIMENTS),
A. A. Ivanova.
Soviet Hydrol: Selec Pap, No 2, pp 121-135, 1967. 15 p, 7 fig, 3 tab, 16 ref. Translation from Trudy GGI, No 140, pp 44-63, 1967.

Descriptors: *Unsteady flow, *Channel flow, *Waves (Water), *Equations, Flow profiles, Model studies, Hydraulic properties, Hydrographs.
Identifiers: Saint Venant equations.

Flow in trapezoidal and rectangular section channels was studied to evaluate various approximate solutions of the Saint Venant unsteady flow equations and to determine the influence of channel storage, channel sectional shape, roughness coefficient, slope, and time profile of the flow release. Since the system of Saint Venant equations, which describes the process of unsteady flow, is nonlinear and cannot be solved analytically in the general form, it is impossible to determine analytically the influence of each of the factors in this complex multiple-factor process. This can be done only on the basis of various assumptions, giving an approximate picture of the influence of these factors. Waves progressing downstream after an abrupt release are represented by loops in the hydrograph of the flow. As a wave diminishes downstream, the hydrograph loop lengthens and thins, until at a sufficient distance from the release point, the wave disappears and the hydrograph curve becomes single valued. Partial data from 200 experimental releases are plotted, and the forms of solutions to unsteady flow equations that may yield waves or hydrograph loops are discussed. (Knapp-USGS)

THE RELATION BETWEEN MAINSTREAM LENGTH AND AREA IN DRAINAGE BASINS,
IBM Watson Research Center, Yorktown Heights, N. Y.
J. S. Smart, and A. J. Surkan.
Water Resources Res, Vol 3, No 4, pp 963-974, 1967. 12 p, 6 fig, 6 tab, 19 ref.

Descriptors: *Watersheds (Basins), *Drainage patterns (Geologic), *Meanders, Geomorphology.
Identifiers: Drainage basin characteristics, River classification, Stream lengths, Stream numbers, Stream sinuosity.

Analyses of small drainage basins show that variations in stream sinuosity can affect the value of the exponent n prime in Hacks length-basin area relationship L prime = C (A to the power n prime). A simple approximate formula relates mainstream length, sinuosity, basin shape, and basin area and shows how the contributions of sinuosity and shape variation may be separated and evaluated. The generally accepted statement that drainage basins are more elongated with larger area needs further investigation. (Knapp-USGS)

AN APPLICATION OF PRINCIPAL COMPONENT ANALYSIS AND FACTOR ANALYSIS IN THE STUDY OF WATER YIELD.
Tennessee Univ, Knoxville, Tennessee.
Guillermo Diaz, J. I. Sewell, and C. H. Shelton.
Water Resources Research, Vol 4, No 2, pp 299-306, April 1968. 7 tab, 13 ref.

Descriptors: *Water yield, Watersheds, Ohio, Texas, Soil types, Regression analysis.
Identifiers: *Principal component analysis, *Factor analysis, Area, Slope, Cultural practices, Land capability, Varimax rotation.

Principal component and factor analysis were applied to annual precipitation and runoff data of fourteen watersheds from Coshocton, Ohio, and seven watersheds from Riesel, Texas. The objective was to identify the factors affecting the water yield of these watersheds and to determine the relative importance of the identified factors. From the Ohio watersheds, the rotated factor analysis suggested that watersheds area and slope were, in that order, the two most important factors affecting water yield. For the Texas watersheds, three almost equally important watershed factors were identified as the soil type, cultural practices, and land capabilities. A stepwise regression of runoff-precipitation ratios of the Ohio data on area-slope variables substantiated the effects of area and slope on runoff that were determined in the factor analysis. STEADY AND UNSTEADY EFFECTS ON DISCHARGE IN A RIVER CONNECTING TWO RESERVOIRS.
Cornell Univ, Ithaca, N Y.
James A. Liggett, and Walter H. Graf.
Tech Rep 5, Water Resour Center, Aug 1967. 10 p, 9 fig, 4 ref. OWRR Project A-009-NY.

Descriptors: Flood routing, Shallow water, Equations, *Unsteady flow, *Steady flow, Roughness coefficient, *Open channel flow, *Streamflow, *Discharge measurement, Lake Huron.
Identifiers: Finite difference method, St Clair River (Michigan).

The effects of the frictional coefficient, lake levels and unsteady flow are considered for a river which joins 2 reservoirs. These effects are studied numerically by using a somewhat idealized model of the St. Clair River, which connects Lake Huron to Lake St. Clair. The analysis shows that each of these factors has a large effect on the flow. An unsteady flow analysis of the river is probably necessary if the lake levels are subject to any major fluctuations. A method is proposed by which the frictional constant can be determined accurately. The adjustment process of the frictional constant can be either internal or external to the machine computation. If the constant is allowed to vary with both depth and distance along the river, quite a number of runs will be necessary to determine it accurately. The present study indicates (but does not prove) that continuous and accurate geometrical data (cross section, slope, etc.) are probably not necessary for such a program.

Identifiers: Open-channel dispersion.

A series of experiments conducted in a rigid-boundary laboratory flume having an artificially

LIBRARY U. OF I. URBANA - CHAMPAIGN

roughened bed compared longitudinal dispersion of suspended silt-size sediment particles with longitudinal dispersion of a fluorescent dye solution and longitudinal and lateral dispersion of floating polyethylene particles. The longitudinal and lateral dispersion processes for dissolved dispersants and floating particles converged to a Fickian-type diffusion process quite rapidly with increasing dispersion distance. The values of the longitudinal dispersion coefficient for the dye closely correspond to J W Elder's theory. Except in the sediment-dispersion experiments, the dispersion coefficients were approximately proportional to the product of the depth and the shear velocity. The longitudinal dispersion process for suspended silt-size particles resembles the process for the dye, but is modified by the particles settling toward the slower moving flow near the bed and eventually depositing on the bed. The longitudinal distribution of particle deposition can be calculated using T R Camp's the theory of the influence of turbulence on sedimentation in settling tanks. The confining effect of the sidewalls on the lateral distribution of dye can be accounted for satisfactorily by the reflection-superposition principle. (Knapp-USGS)

SIMULATION OF OVERLAND FLOW ON SHORT FIELD PLOTS,
U. S. Department of Agriculture, Agricultural Research Service, and Purdue University, Lafayette, Ind.
G. R. Foster, L. F. Huggins, and L. D. Meyer.
Amer Geophys Union, 49th Annu Meeting, Washington, D. C., Apr 8-11, 1968 (Pap), 10 p, 1968. 5 fig, 1 tab, 4 ref. OWRR Project B-003-IND.

Descriptors: *Overland flow, *Model studies, *Continuity equation, *Uniform flow, *Darcy-Weisbach equation, Fallowing, Roughness coefficient, Roughness (Hydraulic), Rainfall, Discharge (Water), Hydrographs, Slopes.
Identifiers: Kinematic wave theory.

An overland flow model based on the kinematic wave theory was developed to analyze overland flow on short, very rough erosion plots. Simulated rainfall was applied at 2.5 in/hr through nozzles that spray downward as they move across the plot. Plot sizes were 35 ft long and 10 and 12 ft wide; the surface condition was fallow. Field hydrographs were used to estimate retention storage and the Darcy-Weisbach coefficient of friction. The model includes variable point infiltration rate and a variable coefficient of friction, the 'drying up' of the upstream end of the slope during recession, and a variable area infiltration rate that is a function of the water surface area during recession. These were used in the model to simulate hydrographs which were compared with field hydrographs to test the concepts used in the model. The model with a constant Darcy-Weisbach coefficient of friction or Manning's n adequately describes overland flow on short erodible slopes. (Knapp-USGS)

Virginia Polytech Inst Water Resources Res Center Bull 12, 74 p, May 1968. 36 fig, 49 ref, 1 append. OWRR Project A-013-Va.

Descriptors: *Runoff, *Rainfall-runoff relationships, *Runoff forecasting, *Systems analysis, Simulation analysis, Synthetic hydrology.
Identifiers: Process dynamics, Information theory.

The feasibility of applying systems analysis techniques to hydrology by examining the hydrologic runoff process in terms of fundamental process dynamics is examined. In any system, the output and the input signals may be related by a transfer function, the ratio of the Laplace transform of the output function to the Laplace transform of the input function. If the transfer function of a system is known, the output may be calculated easily from given or assumed input. For simple systems, the transfer function may be derived theoretically by the physical characteristics of the system, but for complex systems, or from a system whose physical relations are not surely known, theoretical formulation becomes impossible, and an experimental approach is called for. The use of analog and digital computers has made possible the application of systems analysis to physical systems that only a few years ago were impossible to analyze. Simplified hydrologic laboratory models were used in developing, the mathematical models. Impervious catchments of simple rectangular configuration, sloping 0-8 deg, supplied with uniform rainfall from nozzles, were used and evaporation was neglected. A general transfer function was developed for hydrologic runoff systems. (Knapp-USGS)

ESTIMATION OF GROUND-WATER CONFIGURATION NEAR PAHALA, HAWAII USING ELECTRICAL RESISTIVITY TECHNIQUES,
Hawaii Univ., Honolulu.
Donald M. Hussong, and Doak C. Cox.
Water Resour Res Center Tech Rep 17, Aug 1967. 35 p, 12 fig, 1 tab, 57 ref. OWRR Project B-005-Hi.

Descriptors: *Ground water, *Water table, *Resistivity, Geophysics, Dikes, Saline water-fresh water interfaces, *Hawaii.
Identifiers: Kau, Hawaii.

In 1965 Water Resources Research Center, University of Hawaii, began development of necessary equipment to explore feasibility of an extensive resistivity exploration program. Subsequent funding permitted application of the technique toward solution of a ground-water problem in Pahala. A series of 14 electrical soundings was completed at Pahala, Sept 1966, to determine the extent and causes of an anomalous high water table. Four of the soundings indicated the limits of this underground reservoir to be at least 3500 ft east and 2500 ft south of a Maui-type well shaft. The southern extent of high head ground water suggests NE-SW trending of the eruptive fissure vent about 4000 ft SE of the well as a likely hydrologic barrier. Other soundings, indicate intermediate water tables along the direction of the strike of the vent indicating a series of similarly trending dikes forming steps of water entrapment dropping toward the ocean. North of the hypothetical sequence, a set of somewhat confused soundings indicate what may be ancient buried soil or ash surfaces serving as impermeable boundaries presenting direct normal ground-water flow from Pahala SW above the dikes to the ocean south of Punaluu.
W69-00710

SUBSURFACE FLOW IN A SOUTHERN ILLINOIS FRAGIPAN SOIL,
Illinois Univ., Urbana.
W. R. Boggess, and Elon S. Verry, Jr.
Water Resour Center Rep, Feb 1967. 51 p, 22 fig, 6 tab, 32 ref, append. OWRR Project A-009-Ill.

Descriptors: *Groundwater flow, Seepage, Soil moisture, Geology, *Perched water table, Illinois, *Subsurface flow.
Identifiers: Fragipan soil.

Based on plot determinations, subsurface flow provides a significant component of total water yield, comprising 29% of the direct runoff and about 1/5 of the total water, applied as artificial rainfall to plots whose soil moisture storage capacity was satisfied. Measurable subsurface flow lasted for 36 hr, followed by some dripping for an additional 12 hr. Such conditions occur during the winter and early spring when evapotranspiration is at a minimum. Subsurface flow in the Grantsburg and similar soil series is caused by a well-developed fragipan impeding downward movement of water in the profiles. Following recharge during the fall and winter, these soils may develop a perched water table, causing tillage difficulties if it persists into the spring months. The fragipan acts as a barrier to ground-water recharge by routing subsurface flow to stream channels, or to soil surface on severely eroded slopes. As a result, ground-water resources of the southern Illinois uplands are poor and streamflow is very low or nonexistent during the summer and fall. Towns away from main watercourses often depend on impoundments to provide water for their needs. Data indicate that from 1/3 to 1/4 of the direct runoff into such impoundments results from subsurface movement of water.

THE PRESENT AND FUTURE GROUND WATER SUPPLY OF THE BATON ROUGE AREA,
Louisiana State Univ., Baton Rouge.
Raphael G. Kazmann.
Louisiana Water Resour Res Inst, Tech Rep 2, Sept 1967. 36 p, 8 fig, 7 tab, 11 ref. OWRR Project B-001-La.

Descriptors: *Water supply, Economics, *Groundwater recharge, Legal aspects, Hydrogeology, Aquifers, *Encroachment, Estimated cost, Water management (Applied), Louisiana.

Salt water encroachment in the Baton Rouge aquifers may be reduced or stopped by decreasing the net offtake from each aquifer that must be protected. Replacement water is available from the alluvium of the Mississippi River. Amite or Comite Rivers can also supply all or part of the replacement water, either directly or through spreading grounds utilizing the water from one or both rivers. The cost of providing suitable water from the Mississippi alluvium would range from 7 cents/thousand gallons for treated domestic water to as little as 3 cents/thousand for aerated and filtered industrial water. The work now in progress will provide descriptions of alternative projects and water costs associated with each. Several phases of the multidisciplinary Baton Rouge study are described in detail, as well as preliminary results and the plans for the final phases of the work.

THE RECENT ALLUVIUM OF THOMAS AND DUNCAN POINTS,
Louisiana State Univ., Baton Rouge.
Joseph D. Martinez.
Louisiana Water Resour Res Inst, Tech Rep 1, June 1967. 24 p, 12 fig, 3 plate, 13 ref. OWRR Project A-004-La.

Descriptors: Geologic formations, *Aquifers, *Freshwater, Water supply, *Alluvium, Natural recharge, *Louisiana.

Available borings and reports concerning the Mississippi River alluvium near Baton Rouge, Louisiana, are examined and interpreted. Two particular areas, Thomas Point-Devil's Swamp and Duncan Point, contain sands which are potential sources of naturally-filtered river water. Due to the scarcity of reliable borings in the Thomas Point-Devil's Swamp area, subsurface data from nearby similar areas are extrapolated. Two of the 12 figures and 3 plates analyze the frequency of depths to top of the sand obtained from borings. At Duncan Point, the potential aquifer sand is estimated to

extend from -20 to below -200 feet mean sea level. Thomas Point, more difficult to interpret, probably has sand from -95 (possibly -65) down to -150 feet msl or lower. Additional borings are needed.
W69-00722

EFFECTS OF INDUCED STREAMBED INFILTRATION ON WATER LEVELS IN WELLS DURING AQUIFER TESTS,
Minnesota Univ., Minneapolis.
William C. Walton, and Earl A. Ackroyd.
Water Resour Res Center Bull 2, June 1966. 43 p, 21 fig, 4 tab, 25 ref. OWRR Project A-010-Minn.

Descriptors: *Surface-groundwater relationships, Influent streams, Rivers, Streambeds, Streamflow, Aquifers, *Artificial recharge, *Water table, Drawdown, Groundwater recharge, *Induced infiltration, *Analog computers, Permeability, Storage coefficient.

Electric analog computers, simulating streambed as an area of recharge with natural conditions, were used to appraise accuracy of estimated effects of induced infiltration on water levels based on image well theory. Electric analog computers for 2 aquifer test sites where field data were available were constructed. Selected aquifer tests involve 2 extreme aquifer-stream situations, i.e., where the cone of depression spreads beneath and beyond the entire streambed and where the cone of depression spreads only part way beneath the streambed. Analog computers consist of analog models and excitation-response apparatus. Analog models are scaled-down versions of aquifer-stream situations. During induced infiltration aquifer tests, the image-well theory closely describes drawdowns on land sides of streams with a high degree of accuracy. Drawdowns beneath or beyond the streambed and streambed areas of infiltration based on image-well theory are not observed in the field. However, streambed infiltration rates per foot of head loss based on hypothetical drawdowns computed with image-well theory seem empirically correct. Additional research recharge through streambeds partially penetrating aquifers and having finite widths, under varying stream-stage and water-level conditions is needed.

Water Resour Res Center, Tech Rep 4, March 1967. 32 p, 11 fig, 6 tab. OWRR Project A-011-Hi.

Descriptors: Water quality, Aquifers, Salinity, Wells, Water wells, Bosalts, Test procedures, *Deep wells, *Sampling, pH, *Monitoring, *Groundwater, *Logging (Recording).
Identifiers: Hawaii, *Well logging, Well hydrograph, Oahu, Hawaii, *Puuloa Test Well, Hawaii, *Ewa Beach Test Well, Hawaii.

Two deep wells, one at Puuloa and the other at Ewa Beach in the Pearl Harbor area were drilled through the thick sedimentary cap into Koolau basalt, and have been readied for multiple-zone recording of water levels and water quality. Plastic pipes were lowered into the wells to selected depths determined by core composition and electric well logs. Gravel and beach sand were used selectively to backfill the wells. Thirteen sampling tubes were installed in the Puuloa well, and 7 sampling points were placed in the main well at Ewa Beach. A shallow auxiliary well was also drilled at Ewa Beach. Evidence from preliminary development of the deep aquifer at Ewa Beach indicates the possible existence of a thin layer of fresher water floating on water of nearly sea water composition. Water levels are being monitored in this aquifer and show a tidal efficiency of approximately 15%. The smaller sampling tubes are being developed at both sites.

DETERMINATION OF POROSITY AND PERMEABILITY OF SELECTED SANDSTONE AQUIFERS OF SOUTH DAKOTA,
South Dakota School of Mines and Technology, Rapid City.
John P. Gries, and David W. Niven.
Dep Geol Geologic Eng Rept, Feb 1967. 13 p, 4 fig, 1 tab, 5 ref, append. OWRR Project A-004-SDak.

Descriptors: *Porosity, *Permeability, *Confined water, Cores, South Dakota, Aquifers, *Sandstones, Sampling, Geology, Hydrogeology, Testing, Measuring instruments, Rock properties, Groundwater, Groundwater recharge.

Lower Cretaceous sandstones crop out continuously around the periphery of the Black Hills. These outcrops are believed to be the principal intake area for artesian water within these formations. Data on porosity and permeability were obtained from 376 cores cut by the investigators from outcrops along a 70 mi interval on the east flank of the Hills. Porosity and permeability were determined in the laboratory by means of a Ruska Porometer and a Ruska Permeameter. Permeability of Lakota Sandstone (202 cores) cut parallel to bedding ranged between 1.2 and 41,500 md, with a mean of 9115 md. Permeability perpendicular to bedding (35 samples) varied from 15.7 to 30,800 md, with a mean of 5683 md. Porosity of all 237 Lakota cores averaged 28.5%. Permeability of Fall River Sandstone (86) cores cut parallel to bedding ranged from 0 to 10,600 md, with a mean of 2052 md. Perpendicular to bedding (17 samples) ranged from 0.3 to 3622 md, with a mean of 793 md. Mean porosity of 103 Fall River cores was 23.9%. Mean values for 15 Newcastle Sandstone cores showed a permeability of 461 md, and a porosity of 19.6%. These outcrop figures are consistently greater than corresponding values reported from nearby deep oil and water tests.

OCCURRENCE OF NITRATE IN WELL WATERS,
Illinois Univ., Urbana.
T. E. Larson.
Water Resour Center, Proj 65-05G, June 1966. 15 p, 2 fig, 5 tab. OWRR Project A-005-Ill.

Descriptors: *Wells, *Nitrates, Chemical analysis, *Concentration, Deep wells, Shallow wells, Hazards, Livestock, Man, Farm wastes, Soil types, Field investigations, Illinois.

Purpose of this project was to study the occurrence of nitrate in well waters in Illinois by relating nitrate occurrence to well depth, to the source of the water, to the physiographic divisions of the state, and to the geographical location of the well. Selected locations within the state containing high nitrate concentrations were correlated with geologic information on soils and subsoils. The study shows that excessive concentrations of nitrate are more likely to be found in shallow wells than in deeper wells. Of the samples taken from shallow wells 23% contained 45 mg/1 or nitrate. Excessive concentrations of nitrate are more likely to be found in drift wells than in limestone or sandstone wells. High nitrate concentrations were well scattered throughout the state except for 3 areas. Well construction is an important factor in the nitrate content of well waters. Any construction that allows surface water or water from a shallow depth to enter the well is more likely to contain excessive nitrate concentrations. No attempt was made to correlate nitrate concentration with soil types or with proximity to common sources of nitrate in farm wells such as barnyards, feedlots, manure piles, and septic tank fields.

RECORDS OF WELLS, WATER LEVELS, AND CHEMICAL QUALITY OF WATER IN THE LOWER SANTIAM RIVER BASIN, MIDDLE WILLIAMETTE VALLEY, OREGON,
U. S. Geological Survey, Washington, D. C., Water Resources Division.
D. C. Helm.
Oregon State Eng Ground Water Rep No 13, May 1968. 186 p, 4 fig, 1 plate, 1 map, 4 tab, 8 ref.

Descriptors: *Data collections, *Hydrologic data, *Water wells, *Water levels, *Water quality, Oregon.
Identifiers: Santiam River Basin (Oregon).

Well records, water levels, and groundwater chemical analysis data are collected and compiled as part of a comprehensive hydrologic study of the Lower Santiam River Basin in the Middle Williamette Valley, Oregon. Water-level fluctuations are shown on hydrographs of 12 selected wells in the area. Records of 1,204 wells include 919 irrigation wells, 128 domestic wells, 53 industrial wells, 19 public supply wells, 10 institutional wells, 4 stock wells, 54 unused wells, 7 test wells, and 10 unclassified wells. Data for each well include type, use, year completed, depth, diameter, depth of casing, finish, depth to aquifer, aquifer thickness, character of aquifer, altitude and depth of water, pump, yield, drawdown, use, acres irrigated, and remarks. Drillers logs of 349 wells are compiled. Chemical analyses of water from 49 wells, 1 spring, and 5 rivers, and spectrographic analyses of water from 7 wells are reported. The standard analyses include silica, Fe, Mn, Ca, Mg, Na, K, bicarbonate, carbonate, sulfate, Cl, F, NITRATE, PHOSPHATE, B, As, TDS, hardness, pH, and color. Spectrographic analyses include Al, Be, Bi, Cd, Cr, Co, Cu, Ga, Ge, Fe, Pb, Mn, Mo, Ni, Ti, U, V, Zn, Beta activity, and Ra. (Knapp-USGS)

REMOVAL OF IRON AND MANGANESE FROM GROUND WATER,
Mississippi State Univ., State College, San. Eng. Dept.
Lloyd R. Robinson, Jr.
Prog Rep, Water Resour Res Inst, 1966. 29 p, 2 fig, 8 tab, 10 ref. OWRR Project A-003-Miss.

Descriptors: *Groundwater, *Iron, *Manganese, Aeration, Sedimentation, Filtration, Pilot plants, Chemical analysis, Water quality, Sewage treatment, Mississippi.

This paper is a progress report on research to determine factors involved in removal of iron and manganese from ground waters and to find ways of counteracting these interferences in the conventional treatment method of aeration, sedimentation, and filtration. The first phase has been to complete an initial screening and includes studies of available state records and contacts with local and state officials to locate problem spots in Mississippi. The second objective has been to construct and test pilot plant facilities to be used in making a detailed study of the problem of interferences with the removal of iron and manganese from ground water. The pilot plant has been so constructed that it can be used to study waters brought to, or synthesized in the laboratory, or taken to the field and operated at well-site. The final objective which has not been completed is to find a method satisfactory for analyzing large numbers of manganese samples collected during the latter phases of the study.

ON THE SIMILITUDE OF DISPERSION PHENOMENA IN HOMOGENEOUS AND ISTROPIC POROUS MEDIUMS,
Tahal, Water Planning for Israel Ltd., Tel Aviv.
Y. Bachmat.
Water Resources Res, Vol 3, No 4, pp 1079-1083, 1967. 5 p, 5 ref.

Descriptors: *Dispersion, *Solutes, *Porous media, *Model studies, *Hydraulic similitude, Analytical techniques, Groundwater, Groundwater movement, Darcys law, Laminar flow, Model Studies.
Identifiers: Peclet number.

A procedure of simulating, by means of a physical model, the dispersion of a solute in groundwater flowing through a homogeneous and isotropic aquifer is considered. Groundwater is a solution of variable density and viscosity owing to variations of solute concentration. The model has a very restricted application owing to the required simultaneous invariancy of four nondimensional criteria of similutude: a macroscopic Reynolds number, a macroscopic Peclet number, the criterion of geometrical similarity of the medium, and the criterion of physcochemical similarity of the solution. However, at certain conditions, which are common in practice, some of those criteria can be waived, and the model becomes a useful device for the solution of field problems. These conditions occur in the range of validity of Darcy's law (small Reynolds numbers), at relatively high Peclet numbers, and at very small variations of relative solute concentration (ideal solute). FACTORS AFFECTING GROUND-WATER RECHARGE IN THE MOSCOW BASIN, LATAH COUNTY, IDAHO,
Washington State Univ, Pullman.
Chang-lu Lin.
Pap, Dept of Geol, Sept 1967. 86 p, 31 fig, 7 tab, 39 ref. OWRR Project A-007-WASH.

Descriptors: *Groundwater basins, *Hydrogeology, Aquifers, Water table, Groundwater barriers, Groundwater movement, Idaho, Groundwater recharge, Natural recharge, Hydrologic cycle, Surface groundwater relationships, Geologic control.

The depleting ground-water reservoir reflected by long-term declines in the piezometric surface creates a critical problem in the Moscow basin. Results of climatological, hydrological, and geological studies indicate that low intensity of precipitation; (1) frozen ground; (2) high evaporation potential; (3) thickness, extent, and clay content of the Palouse loess and Latah Formation; (4) interflow zones; (5) fracture zones; and (6) the presence of ancient drainage channels are the primary factors affecting ground-water recharge in the basin. Fluorescent dye-dilution techniques have been used to detect stream losses near the margins of the plateau basalts. Results of these measurements verify other studies and indicate that this method is a sensitive tool in measuring the low flow of a stream. By applying this method, it can be shown that a portion of the surface flow joins the underflow in areas of low gradient and again rejoins the surface stream in reaches of steep gradient along Crumarine Creek. A portion of the underflow or component of surface flow eventually recharges the basin.

UNSTEADY UNCONFINED GROUNDWATER FLOW TOWARD A WELL,
Wisconsin Univ, Madison.
Willard A. Murray.
Pap, 1966. 19 p, 2 fig, 1 tab, 8 ref. OWRR Project A-005-WIS.

Descriptors: *Groundwater flow, *Wells, *Unsteady flow, Ground water, Computer programming, Aquifers, *Drawdown, *Water wells.
Identifiers: Pumping tests, Dupuit-Forchheimer idealiza.

The differential equation for unsteady unconfined radial flow to a well is solved by a numerical method on a digital computer. The application of the Dupuit-Forchheimer concept is the only simplifying assumption made. Analysis of results indicate that there is a substantial range of values for which the confined flow (Theis) solution is sufficiently accurate for use in problems involving unconfined aquifers. Graphical methods of solution are presented for determining aquifer characteristics and for predicting drawdown curves in unconfined aquifers.

GROUND-WATER HYDROLOGY OF THE MONOGAHELA RIVER BASIN IN WEST VIRGINIA,
U S Geological Survey.
Porter E. Ward, and Benton M. Wilmoth.
West Virginia Geol and Econ Surv, River Basin Bull 1, 54 p, 1968. 22 fig, 6 tab, 38 ref.

Descriptors: *Groundwater, *Water resources, *West Virginia, *Water yield, *Aquifers, Water quality, Water sources.
Identifiers: Monogahela River Basin (W. Va.).

Adequate supplies of groundwater are available in the Monogahela basin to meet present and future requirements. The best sources are wells in bedrock, particularly in sandstone. The most favorable areas are underlain by rocks of the Pottsville Group, Allegheny Group, Greenbrier Limestone, and the Pocono Formation. Yields of 50-350 gpm are common in most areas. The Dunkard Group yields only about 21 gpm; development of water supplies in its outcrop area is difficult, requiring intensive investigation and test drilling. Alluvium is too thin and areally restricted for large groundwater development. Water quality is generally good, with high iron, hardness, and hydrogen sulfide concentration in a few places. Some salty water is found below 100-300 ft in the western part of the basin. Some oilfield, municipal, household, and chemical pollution occurs in a few areas. Coal-mine acid pollution has a small effect generally, but in some populated areas it is a difficult problem. Descriptions of geologic units and their water-bearing properties are tabulated. Geology, water potential, and water quality are shown by maps. (Knapp-USGS)

RADIOMETRIC STUDIES OF THE FLORIDAN AQUIFER: PROJECT COMPLETION REPORT, (CHAP) B--U-234/U-238 DISEQUILIBRIUM AS AN AID TO HYDROLOGIC STUDY OF THE FLORIDAN AQUIFER,
Florida State University, Department of Geology, Tallahassee.
M. E. Kaufman, H. S. Rydell, and J. K. Osmond.
U S Office of Water Resources Research, Washington, D C, pp B1-B5, July 1968. 5 p, 1 fig. OWRR Project A-005-Fla.

Descriptors: *Uranium radioisotopes, *Tritium, *Tracers, *Water sources, *Karst, Movement, Water circulation, Radiochemical analysis, Florida.
Identifiers: Floridan aquifer.

Uranium disequilibrium studies of the waters of the Floridan aquifer in north Florida suggest the possibility of using the study of natural fractionation of uranium isotopes to aid in hydrologic investigations. Analysis of the relations between the isotopic distribution patterns and the hydrologic flow system indicates the following: (1) Artesian waters exhibiting large negative departures from equilibrium (U-234/U-238 ratios: 0.50 to 0.96) underlie the Woodville Karst Plain and parts of the sinkhole-riddled Tallahassee Hills, interpreted as areas of recharge, high permeability and rapid circulation of groundwater. To account for the low isotopic ratios observed in these waters, it is hypothesized that Pleistocene leaching occurred, resulting in preferential removal of U-234. (2) Artesian waters with U-234/U-238 ratios near equilibrium are associated with Gulf Trough, interpreted as an area of low permeability and restricted groundwater circulation, with little Pleistocene leaching. A hydrologic barrier preventing any significant present southeastward movement of groundwater across the Gulf Trough is suggested. A tritium study of the Floridan aquifer shows promising preliminary results but is as yet incomplete. (Author)

PHASE I TEST WELLS, WHITE SANDS MISSILE RANGE, DONA ANA COUNTY, NEW MEXICO,
U S Geol Surv, Albuquerque, N Mex.
Gene C. Doty.
U S Geol Surv open-file rep, 39 p, July 1968. 12 fig, 11 tab, 2 ref.

Descriptors: *Water supply, *Water wells, *Exploration, New Mexico, Hydrologic data, Aquifers, Chemical analysis, Data collections, Water yield, Logging (Recording).
Identifiers: White Sands Missile Range (New Mexico), Test holes.

To explore the water-producing potential of the south-central part of White Sands Missile Range, 5 test wells were drilled in 1966 and 1967. Samples were collected and described, electric logs were made, and water samples were collected and analyzed. Small-yield (5-10 gpm) wells can be drilled in the fractured igneous rocks near surface drainage channels. Storage is small and wells may not be dependable. Wells in an alluvial fan should yield several hundred gpm of potable water containing 200 ppm sulfate. Bolson deposits have transmissibilities of about 20,000 to 295,000 gpd per ft. Water quality varies markedly with depth; specific conductance at 352 ft was 1,490 micromhos and at 635 ft, 61,000 micromhos. Sample descriptions, drillers' records, and chemical analyses are tabulated. Copies of commerically

made electric and radiation logs are included. (Knapp-USGS)

THE APPLICABILITY OF DARCY'S LAW,
Purdue Univ, Lafayette, Indiana.
Dale Swartzendruber.
Soil Sci Soc of Amer Proc, Vol 32, No 1, pp 11-18, Jan-Feb 1968. 8 p, 6 fig, 1 tab, 36 ref, 1 append. OWRR Project A-004-Ind.

Descriptors: *Darcys law, *Kinetics, *Saturated flow, *Unsaturated flow, Velocity, Porous media, Clays, Diffusivity, Infiltration.
Identifiers: Nonproportional flow, Non-Darcian flow laws.

Deviations from Darcian proportionality between flow velocity v and hydraulic gradient i are considered in terms of a gradient-dependent hydraulic conductivity K (i)=v/i. Published data for saturated flow indicate measured variations in K (i) of 2- to 4-fold, with a potentiality for 5- to 15-fold variations inferred from fitted non-Darcian flow equations. Non-Darcian effects for 2-dimensional radial flow are also analyzed. The hydraulic head distribution is shifted from the Darcian-derived logarithmic pattern toward the characteristic linear distribution for 1-dimensional flow, and the amount of the shift is velocity dependent. This implies that the flow net changes with flow velocity, and that the high-gradient flow regions are more permeable than for Darcian flow. The soil-water diffusivity D for some unsaturated soils appears to be a gradient-dependent quantity. A maximum 8-fold variation in D is associated with a 40% discrepancy between experimental water-absorption rates and those calculated from proportional flow theory. Similarly, a 115% discrepancy in the rate of infiltration into a mixture of quartz sand and ground silica can be precisely accommodated with a non-Darcian infiltration equation derived by a simplified analysis. (Knapp-USGS)

GROUND-WATER EXPLORATION IN THE BOSQUE DEL APACHE GRANT, SOCORRO COUNTY, NEW MEXICO,
U S Geol Surv, Albuquerque, N Mex.
James B. Cooper.
U S Geol Surv open-file rep, 79 p, Aug 1968. 12 fig, 14 tab, 4 ref.

Descriptors: *Water supply, *Water wells, *Exploration, New Mexico, Hydrologic data, Aquifers, Chemical analysis, Data collections, Water yield.
Identifiers: White Sands Missile Range (New Mexico), Socorro County (New Mexico), Test holes.

Test drilling along the Rio Grande in the Bosque del Apache Grant in Socorro County, New Mexico shows that the area is hydrologically complex and that the quality of the groundwater varies from saline to fresh within short distances both laterally and vertically. Nearly all of the riverside land in the Grant is occupied by the migratory waterfowl refuge of the Bosque del Apache National Wildlife Refuge. Potable and near-potable water is obtained from 12 wells that tap sand and gravel, and the wells are capable of yielding 1,000 gal per minute or more. Stallion Range Center, a military installation on the White Sands Missile Range, about 15 miles east of the waterfowl refuge, needs about 100,000 gal per day of potable water, which is not known to be available at a location closer to the Center than the refuge area. Between 1963 and 1967, 7 test wells were drilled, and a suitable location for a supply well was found. The well would be about 250 ft deep and would tap a body of potable water that is about 100 ft in thickness. It is thought to underlie an area of at least 5 sq miles. Diagrammatic sections show the lateral and vertical relation of waters of different quality along the Rio Grande in a part of the Bosque del Apache Grant. Basic data in tables include records of 7 test wells, 12 high-yield supply wells, and 32 chemical analyses of groundwater from the wells. (Knapp-USGS)

EFFECT OF INCREASED PUMPING OF GROUND WATER IN THE FAIRFIELD-NEW BALTIMORE AREA, OHIO--A PREDICTION BY ANALOG-MODEL STUDY,
U S Geol Surv., Washington, D. C., Water Resources Div.
Andrew M. Spieker.
U S Geol Surv Prof Pap 605-C, pp C1-C34, 1968. 34 p, 23 fig, 1 tab, 15 ref.

Descriptors: *Water resources, *Groundwater, *Analog models, *Induced infiltration, *Alluvium, Pumping, Transmissivity, Safe yield, Drawdown, Ohio.
Identifiers: Great Miami River (Ohio), Cincinnati (Ohio), Fairfield (Ohio), Well interference.

Analysis of the groundwater availability of the Great Miami River Valley train aquifer near Fairfield, Ohio by electric analog model has been undertaken to study the hydrologic feasibility of Cincinnati's proposal to enlarge its well field. The 32 sq mi study area is underlain by a sand and gravel aquifer with a transmissibility of about 400,000 gpd per ft. The 2 mi wide aquifer is bounded on both sides by rock of low permeability. Total pumpage is 23 mgd. Recharge by induced stream infiltration is 325,000 gpd per acre of streambed. The model study indicated that a pumping rate of 40 mgd at the proposed well field can be sustained in addition to present pumping. Interference should not exceed 9 ft after 10 yr and total drawdown should not exceed 30 ft. A total pumping rate of 84 mgd from the aquifer is feasible. (Knapp-USGS)

2G. Water in Soils

HYDRODYNAMICS OF GEOPRESSURE IN THE NORTHERN GULF OF MEXICO BASIN,
U S Geological Survey, Baton Rouge, Louisiana.
Paul H. Jones.
Soc of Petrol Eng of AIME, No SPE 2207, 12 p, 1968. 2 tab, 39 ref.

Descriptors: *Osmotic pressure, *Infiltration, *Earth pressure, *Clays, *Pore pressure, Compaction.
Identifiers: Geopressure, Gulf Coast Area.

Pore water is trapped by rapid deposition of deltaic, inner neritic, and middle neritic sand and clay and by growth faulting in the Gulf marginal belt of subsidence. It is expelled rapidly with compaction and moves out through clay beds. Water expelled from the reservoir through clay beds is purified by hyperfiltration, and dissolved solids in remaining water are concentrated until osmotic pressure opposing the flow equals the lithostatic head differential. Consequent restriction of upward water loss increases reservoir temperature; this promotes early diagenesis of montmorillonite, which increases appreciably the volume of free pore water available to the reservoir. The molecular forces of osmotic pressure reduce the effective permeability of clay beds to zero, so that in many places geopressures have been preserved for millions of years. (Knapp-USGS)

THE ADAPTABILITY OF AN EXACT SOLUTION TO HORIZONTAL INFILTRATION,
Cornell University, Ithaca, New York.
Wilfried Brutsaert.
Water Resources Res, Vol 4, No 4, pp 785-789, Aug 1968. 5 p, 3 fig, 1 append, 12 ref.

Descriptors: *Infiltration, Porous media, Seepage, Soil, Moisture, Permeability, Darcys law, Capillary conductivity.
Identifiers: *Flow equations, Horizontal infiltration.

A mathematical solution is provided for the concentration-dependent diffusion equation. The equation is shown to be adaptable to the problem of horizontal infiltration, a phenomenon of one-dimensional flow in a partly saturated porous medium, by a suitable approximation of algebraic functions describing the moisture content capillary suction and the moisture content-capillary conductivity relationships. One of the theoretical results that compares favorably with published experimental data gives the cumulative infiltration as a simple power function. Specific equations are derived and calculations are plotted. (Llaverias-USGS)

BASIC WATER RESEARCH ON NEW ENGLAND SOILS,
Maine University, Orono.
R. V. Rourke, and C. Beek.
Project Completion report. Rep of Office of Water Resources Res, Maine Univ, 3 p and 98 p in attach, June 1968. OWRR Project A-001-Me.

Descriptors: *Data collections, *Soils, *Maine, *Hydraulic conductivity, Soil chemical properties, Soil physical properties, Soil water, Organic matter, Permeability, Retention, Soil water movement, Particle size, Soil density, Acidity, Alkalinity.
Identifiers: *Soil moisture reaction, *Percolation rate.

The physical hydrologic, and chemical characteristics of 8 Maine soils sampled at 5 locations each are collected and tabulated to aid in interpretation and use of soil maps for urban planning, industrial development, agricultural development, domestic waste disposal, and other uses. The characteristics measured and tabulated are organic carbon, moisture retention, water movement, particle size distribution, volume of coarse fragments, bulk density, soil reaction, exchangeable bases, and exchangeable acidity. Water retention was determined for several soil pressures and available moisture in each horizon was reported in inches of water per inch of soil. Saturated hydraulic conductivity was measured on many cores. The ability to receive septic sewage was evaluated by percolation rate tests. (Lang-USGS)

THE INFILTRATION OF IRRIGATION WATER INTO THE SOIL,
Mississippi State University, State College.
James B. Allen, William R. Fox, and Chi-Tong Chang.
Water Resources Res Inst, Completion Report. Miss State Univ Water Resources Res Inst, July 1968. 6 fig, 4 tab, 20 ref. 41 p, OWRR Project A-022-Miss.

Descriptors: *Irrigation, *Infiltration, *Irrigation efficiency, *Computer programs, *Mathematical models, Digital computers, Furrow irrigation, Mississippi.
Identifiers: *Antecedent moisture, Optimum efficiency.

The literature of soil water infiltration in furrow irrigation was reviewed and mathematical models of infiltration were established. The models were written in 4 FORTRAN IV programs for the IBM 360. A numerical example is presented to illustrate the effect of rate, duration, and interruption of inflow on irrigation efficiency. The results of the numerical example suggest that intermittent application of water can result in less runoff losses at some sacrifice in uniformity of application. (Knapp-USGS)

R. W. Skaggs, F. F. Huggins, and E. J. Monke.
Paper presented at 1968 Ann. Meeting ASAE, Utah State Univ. Amer Soc of Agr Eng, Pap No 68-215, June 18-21, 1968. 6 fig, 3 tab, 24 ref, June 1968, 21 p, OWRR Project A-00-Ind.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Infiltration, *Equations, *Rainfall-runoff relationships, *Simulated rainfall, Model studies, Vegetation effects, Regression analysis.
Identifiers: Infiltration equations.

An analysis of infiltration equations proposed by Green and Ampt, Horton, Phillip, and Holtan was made on the basis of experimental data obtained in erosion studies with a plot sized rainfall simulator. An overload flow analysis was used to determine the infiltration - time relationship from the runoff hydrograph. Regression fits of the four equations to experimental data for 52 tests on 13 soils showed that all of the equations adequately described the infiltration rate - time relationship. Values obtained for the equation for each run analyzed are tabulated. (Author)

EVALUATION OF THE GAMMA TRANSMISSION METHOD FOR DETERMINING SOIL WATER BALANCE AND EVAPOTRANSPIRATION,
Clemson University, Clemson, S C. Agricultural Engineering Department.
James T. Ligon.
Amer Society of Agr Eng 1968 Annu Meeting, Utah State Univ, Logan, June 18-21, 1968, Paper No 68-220, 1968. 28 p, 10 fig, 1 tab, 15 ref. OWRR Project A-003-SC.

Descriptors: *Soil moisture meters, *Gamma rays, *Research and development, *Instrumentation, Calibrations.
Identifiers: Gamma ray transmission measurements.

The use of the gamma-ray transmission technique for measuring soil moisture in situ is evaluated. The method has considerable potential, particularly near the soil surface and near significant interfaces. Drift of electronic equipment and the apparent temperature sensitivity of the portable equipment limit present field utility, but techniques to minimize errors are presented. Theory for the determination of moisture changes between observations without prior knowledge of soil density was developed. Field data showing amounts and distribution of soil moisture changes due to infiltration, drainage, and evapotranspiration were obtained in a field test using 5 sets of access tubes during the 1967 growing season at Clemson, S C. (Knapp-USGS)

SOIL MOISTURE AND SOIL TEMPERATURE CHANGES WITH THE USE OF BLACK VAPOR-BARRIER MULCH AND THEIR INFLUENCE ON PINEAPPLE,
Hawaii Univ., Manoa.
Paul C. Ekern.
Water Resour Res Center, Rep 3, Aug 1967. 7 p, 4 fig, 4 tab, 16 ref. OWRR Project A-008-Hi.

Descriptors: *Mulching, *Crop response, *Evapotranspiration, *Soil water, Micrometeorology, Moisture availability, *Lysimeters, Equipment, *Soil temperature, Consumptive use, Water utilization, Water requirements, Evaporation, Fine textured soil, Tensiometer.
Identifiers: *Pineapples.

As mulching practice in pineapple culture in Hawaii has developed over the last 50 yr, a number of functions have been assigned to the action of the mulch. This study gives primary consideration to effect of soil moisture and soil temperature changes upon pineapple growth. Soil moisture changes were determined from field samplings and lysimeter studies at Washiawa, Oahu. Changes in the soil moisture budget with the mulch were so slight that the variability of field sampling precluded assessment without excessive replication. Coefficients of variability for samples taken at the plant butt were 3 to 5% of a moisture constant (e.g., 15-bar point) for a soil series or within a single field. Moisture use, measured by semicontained hydraulic lysimeters, was reduced by the mulch when the soil was very wet but changed little when soil moisture ranged from field capacity (0.15-bar) to the 15-bar points. The mulch raised the average soil temperature about 1.6 C during winter. The measured 1/3 increase in plant growth was nearly identical with the increase calculated from growth-response of pineapple to temperature.

Soil Sci Soc of Amer, Proc, Vol 29, pp 144-148, 1965. 5 p, 6 fig.

Descriptors: *Arid lands, *Water vapor, Soils, Fine-textured soils, *Temperature, Gravimetric analysis, Gases, Liquids, *Diffusion, Monomolecular films, Movement, Thin films, *Water transfer, Equations, Pressure.
Identifiers: Coarse-textured soils, *Aridsoils.

Total diffusion coefficients measured at four pressures were used to calculate vapor and liquid diffusion coefficients for dry soils. Data indicated that the temperature dependence of water movement in thin films (water contents above a monolayer) was only slightly greater than the temperature dependence of bulk flow of water in soils. Water transfer in relatively dry soils occurred in both liquid and vapor phases. In coarse-textured soils vapor diffusion with the associated evaporation-condensation process was the predominant mechanism, while liquid diffusion was negligible. In fine-textured soils, diffusion in thin water films and along particle surfaces was appreciable. Determination of water vapor diffusion in relatively dry soil is important from the standpoint of the vast areas of dry soil that occur in arid regions of the world. (Blecker-Ariz)

INFILTRATION BENEATH A FOREST FLOOR,
Washington Univ, Seattle.
Robert G. LaRock.
Tech Rep 21, Dep Civ Eng, Feb 1967. 23 p, 10 fig, 1 tab, 9 ref. OWRR Project A-001-WASH.

Descriptors: Hydrology, *Infiltration, Percolation, *Soil moisture, Moisture content, Lysimeters, Moisture tension, Hysteresis, Rainfall, Measuring instruments, *Forests.

Using a tension lysimeter system, tensiometers and a soil moisture neutron probe, moisture characteristics of a glacial outwash soil were determined during periods of soil moisture flow resulting from rainfall. In the flow range from zero, with soil at field moisture capacity, to 0.2 in./hr a change of 3% was observed in the soil moisture, and a change of 25 cm in tension. At a depth of 16-in. lateral flow was found during periods of rapid soil moisture flow, in spite of the coarseness of soil texture. It is presumed that this lateral flow was due to the gradual increase in coarseness with depth in the top 2 ft of this soil. Hysteresis characteristics of the soil were determined at depths of 16 and 74 in. The increase in coarseness in the surface 2 ft partially inhibited unsaturated water percolation, causing a wetter-when-wetting moisture-tension hysteresis at the 16-in. depth. A textural boundary at the 14-in. depth of coarse over finer material caused no distinct hysteresis effect.

MECHANICS OF BANK SEEPAGE IN NATURAL STREAMS DURING FLOOD FLOWS,
Nebraska Univ, Lincoln.
Alexander R. Peters.
Water Resour Res Inst Rep, Jan 1968. 26 p, 13 fig, 7 ref. OWRR Project A-006-NEB.

Descriptors: *Banks, Piezometers, Permeability, Time, Soil moisture, Porous materials, *Bank storage, *Seepage, *Groundwater flow, Sands, Porosity, Hydrology, Laboratory tests, Fluid flow.
Identifiers: *Permeability coefficients, Storage coefficients, Darcys law, Transmissivity, Compressibility.

The mechanics of bank seepage have been investigated by studying the characteristics of oscillatory fluid motion in porous media. Of particular interest was the way fluid is stored and given up by the porous medium. The purpose of this theoretical and experimental program was to obtain a better understanding of flow phenomena inside the soil. The various parameters affecting permeability were considered in order to determine the amount of flow stored during 1 cycle of a stream oscillation. Experiments were conducted using a two-dimensional watersand reservoir with 3 kinds of sand and various amplitudes and periods of oscillation. The coefficients of permeability, storage, porosity, and compressibility were determined and were incorporated in the evaluation of the experimental data.

INHERENT AND MAXIMUM MICROBIOLOGICAL ACTIVITY IN SMITH LAKE,
Alaska Univ., College.
S. Burton.
Inst Water Resour Rept, 1968. 8 p, 1 tab. OWRR Project A-004-Alas.

Descriptors: Nitrogen, Microorganisma, Arctic, Kinetics, Enzymes, *Azotobacter, Nitrogen cycles, Biological properties, Cold resistance, Limnology, Lakes, Aquatic environment, *Nitrogen fixing bacteria, Aerobic bacteria, *Aquatic bacteria.
Identifiers: Smith Lake, Alaska.

An examination of the microorganisms catalizing chemical changes in a sub-Arctic lake was made to augment current knowledge of the nutrient cycles in the near Arctic. Several unusual nitrogen fixing species using nitrogen 15 experiments were isolated. Their characteristics were such that they could not be placed in the genera Azatobacter or other known genera. A number of phychrophiles were also isolated and classified. Studies of the enzyme tryptophane synthetase were conducted to compare enzymatic activities of psychrophiles and organisms growing at more usual temperatures. No unusual kinetics were determined.

THE ECOLOGICAL SIGNIFICANCE OF CELLULOLYTIC BACTERIA IN QUABBIN RESERVOIR,
Clark Univ., Worcester, Mass.
John T. Reynolds.
Proj Completion Rep, Jan 1968. 11 p. OWRR Project A-007-Mass.

Descriptors: *Ecology, Bacteria, Algae, Phytoplankton, *Lakes, *Cellulose, Distribution patterns, Membrane processes, Massachusetts.

Ecological significance of cellulolytic bacteria in a large reservoir in central Massachusetts was studied. Bacteria were enumerated using membrane filter techniques: cellulolytic forms were grown out on a modification of Sanborn's China blue-cellulose dextrin agar, and heterotrophs on a mineral salt-mud extract agar and on MPH agar. Suspended cellulose and hemicellulose were concentrated by filtration and estimated by spectrophotometric determinations after treatment with phenol and sulfuric acid. Algae were enumerated and typed using standard procedures, and estimates of the amounts of cellulose produced by the phytoplankton observed were made after determinations of the amounts of cellulose present in known concentrations of algae representative of the types found in the reservoir. Total numbers of bacteria varied between less than 1 per ml of sample to a high of 170 per ml of sample. Presumptive cellulolytic bacteria accounted for from less than 0.5 to 52% of the total bacterial populations measured in several different areas before, during and after an algal bloom. Numbers of presumptive cellulolytic bacteria appear to have no consistant relation with estimates of amounts of cellulose. Estimates of cellulose content of the water varied between 360 to 2750 micrograms per liter of sample.

A MOBILE LIMNOLOGICAL LABORATORY,
Minnesota Univ., Minneapolis, Limnological Res Ctr.
Robert O. Megard, and Joseph Shapiro.
J Limnol Oceanogr, Vol 11, No 3, pp 420-422, July 1966. 3 p, 5 fig. OWRR Project A-008-Minn.

Descriptors: *Limnology, Primary productivity, Chemical analysis, *Eutrophication, Data collections, Aquatic environment, Biomass, *Laboratory equipment.

In connection with the study of primary productivity in Minnesota lakes, a mobile limnological laboratory was constructed with most of the facilities of a modern, well-equipped permanent laboratory. The laboratory is self-contained and can be operated in the field for weeks or months. It is heated and insulated, and has several alternate water and electrical supplies. Standard titrimetric and colorimetric analyses, as well as more sophisticated instrumental analyses, can be performed in field under conditions that compare favorably with conditions in a permanent laboratory. Storage space for limnological equipment and for sediment-coring apparatus is ample and easily accessible.

COMPUTATION OF THE COMPONENTS OF THE THERMAL BALANCE OF PLANNED RESERVOIRS,
L. V. Nesina.
Soviet Hydrol: Selec Pap, No 2, pp 183-189, 1967. 7 p, 4 fig, 2 tab, 13 ref. Translated from Trudy GGO, Main Geophys Observ, No 206, pp 31-37, 1967.

Descriptors: *Heat budget, *Reservoirs, Air temperature, Water temperature, Humidity, Wind velocity, Depth.
Identifiers: USSR, Reservoir thermal budgets.

A method of determining the components of the thermal balance of planned reservoirs is examined. The method is based on computations of the water surface temperature, air temperature and humidity, and wind velocity over the surface of the reservoir. Examples of the computation of the components of the thermal balance are given for reservoirs of various dimensions and depths, and the results of the computations are analyzed. (Author)

EQUILIBRIUM SURFACE WATER TEMPERATURES,
Colorado State Univ., Fort Collins.
James LaVerne Hatheway.
M S Thesis, Colo State Univ, Fort Collins, 55 p, June 1968. 3 fig, 16 tab, 1 append, 54 ref. OWRR-A-006-Colo.

Descriptors: *Water temperature, *Heat transfer, Climatology, Heat budget, Evaporation, Convection, Radiation, Thermal pollution.
Identifiers: Surface water temperature.

A method of predicting the equilibrium surface water temperature of rivers and lakes under natural or thermally polluted conditions was developed. Heat transfer by evaporation, convection, radiation, and solar radiation are included in the development. A mass transfer coefficient was calculated using known mean monthly values for all parameters, obtained from a study of several rivers and a lake. The mass transfer coefficient was correlated empirically with mean monthly wind velocity, and appears to be a function only of wind velocity. Formulas are presented for trial and error calculation of surface water temperatures. (Knapp-USGS)

STRONTIUM ISOTOPE COMPOSITION AND TRACE ELEMENT CONCENTRATIONS IN LAKE HURON AND ITS PRINCIPAL TRIBUTARIES.
Ohio State Univ, Columbus.
Gunter Faure, Lois M. Jones, and Rene Eastin.
Rep 2, Dept of Geol, Aug 1967. 109 p, 21 fig, 20 tab, 28 ref. OWRR Project B-004-Ohio.

Descriptors: Geochemistry, Bedrock, Sedimentary petrology, Great Lakes, Mineralogy, Radioisotopes, Strontium radioisotopes, Lake Huron, Trace elements.
Identifiers: Bedrock composition.

Concentrations of the major cations: Na, K, Ca, and Mg and Sr were determined for 64 samples of surface water from Lake Huron and for 17 of its major tributary rivers. Isotopic compositions of strontium were measured for 30 samples of lake water and for 13 of tributary rivers. Concentrations of dissolved iron and total phosphorus were determined for a small suite of lake and river water. The data documents important differences in the chemical composition of water discharged into Lake Huron by Lake Superior, Lake Michigan and tributary rivers. These differences are related to differences in the chemical and mineralogical composition of the bedrock underlying the Great Lakes drainage basin. The strontium contributed to Lake Huron by water draining the Canadian Shield along its northern shore is enriched in radiogenic strontium 87. The average strontium 87/strontium 86 ratio is 0.718. The rivers draining sedimentary rocks of Michigan and SW Ontario contribute strontium whose isotope composition is similar to that in the modern oceans. A geochemical model is presented representing the chemical composition of water in Lake Huron.
W69-01139

THE KEWEENAW CURRENT, A REGULAR FEATURE OF SUMMER CIRCULATION OF LAKE SUPERIOR,
Wisconsin Univ, Madison.
Robert A. Ragotzkie.
Tech Rep 29, Univ Wisc, Aug 1966. 30 p, 18 fig, 2 tab, 9 ref, disc. OWRR Project A-004-WIS.

Descriptors: Bathythermographs, Distribution patterns, Isotherms, *Remote sensing, Current (Water), *Infrared radiation, Depth, Water temperature, Cross-sections, Thermocline, Circulation, Great Lakes, Lake Superior.
Identifiers: Keweenaw current, Lake currents, Keweenaw Peninsula (Mich.).

Infrared radiometer surveys of Lake Superior during the summer of 1964 and 1965 have shown that a band of warm water separated by a sharp thermal gradient appears along the north coast of the Keweenaw Peninsula in late June and persists at least into August. The subsurface thermal structure in this region indicates a steep slope of the geodynamic surface with the pressure gradient directed offshore. Calculation of current velocity based on the geodynamic slopes gives velocities up to one knot. Direct observations confirm the existence of this current both with regard to location and estimated velocity. The current, for which the name 'Keweenaw Current' is suggested, flows northeastward along the north coast of the Keweenaw Peninsula. It appears to be a boundary current and is probably maintained by the piling up of warm water along the south side of the lake by Ekman transport. It is shown that although the 'thermal bar' effect may exist in early June, this phenomenon does not provide an explanation for the temperature and circulation pattern observed later in the season. Analysis of infrared radiometer data at intersections of flight tracks on a single day gave diurnal heating rates of 0.21 to 0.27 deg C per hr. (Ragotzkie-Wisc)

2I. Water in Plants

THE ANALYSIS OF THE UPTAKE OF WATER BY PLANT ROOT SYSTEMS,
Illinois Univ., Urbana, Agronomy Dept.
A. Klute.
Water Resources Center, Project 65-03G, Aug 1966. 38 p, 18 fig, 7 ref. OWRR Project A-003-Ill.

Descriptors: Analysis, *Plant (Botany), Theory, Water table, *Soil moisture, Water, Models, *Plants.
Identifiers: *Plant-water physics.

The flow equation for water in unsaturated soil may be written to include a source term which can be used to represent the uptake of water by roots of plants. The roots are considered to be distributed in the soil in a continuous manner and the use of water by roots is represented as a negative source. The objective of the research work described in this paper was to obtain solutions of the flow equation for soil water for various boundary conditions and to investigate the effect of the source term on

LIBRARY U. OF I. URBANA - ILLINOIS

the flow patterns. The choice of the source function was studied. Experiments were planned and started to obtain data for verifying the predictions made from the flow theory and to aid in the development of a model for the source function.

THE MECHANICS OF FLUID TRANSPORT IN VEGETATION,
Massachusetts Univ., Amherst.
Denton B. Harris.
Proj Completion Rep, Feb 1968. 11 p, 3 fig, 2 tab, 10 ref, append. OWRR Project A-017-Mass.

Descriptors: Plants, *Flow, Pressure, Transpiration, Trees, Electric fields, Permeability, *Capillary action, Vegetation.

The cohesion theory of sap flow in vascular plants has been tested. Measurements of flow as a function of pressure deop indicate excessive negative pressure would be required for corollation between expiration rates and permeability in native species. Testing disproved diurnal variations in transpiring trees. Careful calibration indicates that measuring apparatus undergoes greater dilatation due to thermal change than does vegetation due to expiration. A search has been conducted for corollation between mass flow in vegetation and electric field potential. It has been shown that high intensity electric fields do have an effect on expiration rates in tomato plants. It has also been demonstrated that pressure induced flow in vascular plants produces an electric potential gradient. These results indicate atmospheric potential and/or biochemical potentials within the plant, may account for the driving forces for sap flow in vegetation. Further research should include microelectrometric surveys of living plant tissue. Gravimetric studies of expiration in electric fields should be undertaken at field intensities of between 200 and 500 volts per meter.

GROWTH AND YIELD OF SAGEBRUSHGRASS VEGETATION IN RELATION TO PRECIPITATION AND TEMPERATURE,
Forest Service, Washington, D. C., Div. of Watershed, Recreation and Range Res.
J. P. Blaisdell.
Proc 9th Int Grassland Congress, Vol 1, pp 465-468, 1966. 4 p, 4 tab.

Descriptors: Arid climates, Sagebrush, *Precipitation (Atmospheric), *Temperature, Productivity, Range grasses, *Correlation analysis, *Weight, *Plant growth, Soil moisture, Climatic data, Growth rates, Crop production, Plant populations, Seasonal.
Identifiers: *Herbage.

The study was concerned with the growth of rangeplants, their year-to-year variations and the extent to which these variations are related to precipitation and temperature on the arid Upper Snake River Plains of Idaho. Correlation analysis was used to relate precipitation and temperature to herbage production. Correlations were based on data for 13 years. Herbage weight was fairly well correlated with precipitation of the 9 month period immediately preceeding the growing season. Correlation coefficients between weight and annual precipitation for the period July 1 to June 30 were generally lower. Most of the plant growth in the locality was completed prior to June and the normal abundant precipitation during that month had little effect on current production. Precipitation during the growing season was rarely great enough to overcome a marked deficiency in soil moisture at planting time. (Blecker-Ariz)

DROUTH TOLERANCE EVALUATION AMONG RANGE GRASS GENERA, SPECIES, AND ACCESSIONS OF THREE SPECIES USING PROGRAM-CONTROLLED ENVIRONMENT,
Agricultural Research Service, Tucson. Crops Research Div.
L. N. Wright.
In affiliation with Arizona Univ, Tucson, Dept of Agronomy. Proc 9th International Grassland Congress, Vol 1, pp 165-169, 1966. 5 p, 1 fig, 3 tab.

Descriptors: *Drought tolerance, *Arid climates, Ranges, *Grasses, Germination, *Drought resistance, Seeds, Plant growth, Variability, *Plant breeding, Growth chambers.
Identifiers: *Seedlings, Survival, Reseeding, *Controlled environment.

A plant growth chamber was used to evaluate the six species, 43 accessions of blue panicgrass, 16 accessions of Boer lovegrass and 22 accessions of Eragrostis spp. for seedling drouth tolerance. Seedling survival data showed differences among accessions which reflect seedling drouth tolerance variability within a species, and further isolation of seedling drouth-tolerant plants within species would be expected. Results suggest that artificial seedling drouth tests can be used to isolate superior drouth-tolerant geno-types and in conjunction with other appropriate plant breeding techniques, to develop improved drouth-tolerant varieties. (Blecker-Ariz)
W69-01010

CONTRASTS AMONG CALANOID COPEPODS FROM PERMANENT AND TEMPORARY PONDS IN ARIZONA,
Ariz. State Univ., Tempe. Dept. of Zoology.
Gerald A. Cole.
Am. Midland Naturalist. Vol 76, No 2, pp 351-368. Oct 1966. 18 p, 5 fig, 4 tab, 38 ref.

Descriptors: *Ponds, *Arizona, *Copepods, Plankton, Aquatic animals, *Ecotypes, Clutch, Eggs, Life cycles, Wet seasons.
Identifiers: Temporary ponds, Permanent ponds.

Thirty-seven samples of plankton from Arizona ponds contained calanoid copepods. Eighteen of these were classified as temporary, the remainder permanent habitats. In order of predominance, the species were Diaptomus albuquerquensis; D. sicilloides; D. clavipes; D. novamexicanus; D. sanguineus and D. nudus. The three predominating species were found in both waters, D. nudus occurred in one permanent and the remainder were found in temporary sites. Clutch sizes and cephalothorax lengths were greater in temporary ponds and there was a correlation between female length and number of eggs per clutch. (Affleck-Ariz)

SNOW CATCH BY CONIFER CROWNS,
Washington State Univ., Pullman, and Forest Sci Lab, Moscow, Idaho.
Donald R. Satterlund, and Harold F. Haupt.
Water Resources Res, Vol 3, No 4, pp 1035-1039, 1967. 5 p, 2 fig, 3 tab, 7 ref.

Descriptors: *Interception, *Conifers, *Snow, Idaho.
Identifiers: Autocatakinetic growth.

Study of interception storage of snow by 2 species of sapling conifers in northern Idaho revealed that cumulative snow catch follows the Law of autocatakinetic growth, or growth which is increased by the results of previous growth and would continue at an increasing rate without constraint. The ability of tree limbs to bear snow is the constraint of the system, and up to that point growth rate increases because snow bridges gaps in the foliage and constantly increases snowholding platform area. Interception storage followed predictions in 5 storms which began with trees bare and in 2 in which snow fell on trees already holding snow. In no storms was there marked deviation from the autocatakinetic law. (Knapp-USGS)

STUDIES OF CONSUMPTIVE USE OF WATER BY PHREATOPHYTES AND HYDROPHYTES NEAR YUMA, ARIZONA,
U S Geological Survey.
Charles C. McDonald, and Gilbert H. Hughes.
U S Geol Surv Prof Pap 486-F, pp F1-F24, 1968. 24 p, 17 fig, 12 tab, 11 ref.

Descriptors: *Phreatophytes, *Consumptive use, *Evapotranspiration, Water table, Arizona, Bermudagrass.
Identifiers: Arrowweed, Quailbrush, Saltbrush.

Studies of the transpiration of several species of flood-plain vegetation, and evaporation from water surfaces and bare soil were carries out near Yuma, Ariz, during a 6-yr period, 1961-66. Arrowweed, fourwing saltbrush, quailbrush, and bermuda grass were grown under controlled conditions in 1,000 sq ft tanks; cattail was grown in 100 sq ft tanks. Evaporation from water surfaces was measured by 2 standard U S Weather Bureau Class 'A' pans and by a 10 ft sq ground-level tank. The immediate area had a moderately dense cover of preponderantly arrowweed, and the environment was principally desert, with high temperatures, low humidity, and a long growing season. Rates of evaporation and transpiration for this area are among the highest in the U S. Annual consumptive use increased with the volume of vegetation, but the consumptive use per unit volume decreased as the plants approached maturity. Depth to the water table strongly influenced evaporation from bare soil; for water table depths of 2.-4.0 ft, evaporation varied from 3 to 20 in. yearly. Arrowweed (Plichea Sericca) used an average of 96 in. of water per yr, quailbrush (Atriplex lentiformis) 44 in., saltbrush (Atriplex canescens), 38 in., and bermuda grass (Cynodon dactylon) used 73 in. THE USE OF STOCHASTIC MODELS IN STUDIES OF ALLUVIAL CHANNEL PROCESSES,
U S Geological Survey, Fort Collins, Colo.
Carl F. Nordin, and Everett V. Richardson.
Int Ass for Hydraul Res 12th Cong Proc, Fort Collins, Colo, Sept 6-14, 1967, pp 96-102, 1967. 7 p, 3 fig.

Descriptors: *Statistical models, *Stochastic processes, *Markov processes, *Alluvial channels, Meanders, Sediment transport, River Systems.
Identifiers: Stochastic models, Poisson processes, Random walk, Branching processes.

Stochastic models can be used to describe either details of sediment transport phenomena or more general aspects of river channel morphology. The compound Poisson process and the random walk serve as models for the dispersion of sediment particles, and a linear second-order Markov process gives the essential statistical properties of the profile of a dune-covered bed. Branching processes and the theory of most frequent random walks find application as models for river networks and river meandering. For simple cases, models describing transport phenomena could be combined with the models of channel morphology to produce a more complete picture of alluvial channel processes. (Author)

RATE OF SOLUTION OF LIMESTONE IN THE KARST TERRANE OF FLORIDA,
lorida Univ., Gainesville.
I. K. Brooks.
Vater Resour Res Tech Completion Rep, Sept 967. 16 p, 2 fig, 23 ref. OWRR Project A-004-Fla.

)escriptors: Aerial photography, Aquifers, Cavies, Erosion, Water quality, Permeability, Porosity, Vater storage, *Stream erosion, Water table, Ruoff, *Sinkholes.
dentifiers: Artesian system, Caverns, *Karst terane.

)ata are presented and examples cited to explain he rate and pattern of development of the solution eatures in the karst terrane of Florida. The overall ate of erosion is 1.5 in. per 1000 yr; the rate varies onsiderably depending upon the quantity and omposition of the runoff influx. The early stages f the cycle have developed under artesian condiions with limited entry of surface water. Relatively ow primary porosity and permeability have esulted in the circulation and solution being fracure controlled. Subsequent development and hanneling of surface runoff into the aquifer results n solution of deep sinkholes, extensive caverns and he development of lake basins and prairies. Circuation of the nearly saturated water through the ock from pore to pore away from the solution avities has resulted in high secondary porosity and ermeability. In the open limestone plain under vater table conditions solution is concentrated in he upper phreatic zone but not because of shallow ines of flow. With this theoretical model of the levelopment of the porosity, permeability, and avities in the Floridan aquifer the fracture traces evident on aerial photographs can be used to obtain he quantity and quality of water desired.

COMPUTATION OF THE GREATEST POSSIBLE DEPTH OF CHANNEL DEGRADATION,
State Hydrological Institute, USSR.
N. S. Znamenskaya.
Soviet Hydrol: Selec Pap, No 2, pp 199-203, 1967. 5 p, 2 fig, 1 tab, 3 ref. Translation from Meteorologiya i gidrologiya, No 4, pp 80-84, 1967.

Descriptors: *Scour, *Stream erosion, *Forecasting, River beds, Dunes, Sand bars, Sand waves, Meanders.
Identifiers: USSR, Volga River, Amu Darya River, Syr-Darya River, Polomet' River.

A method is proposed for computing maximum expected scour at proposed engineering works in channels with dune-form beds. The height of a dune is a function of the ratio of scour to nonscour velocity and of stream depth. To verify the proposed relationship, computations were made and compared with measured depth of scour on the Volga, Amu Darya, Syr-Darya, and Polomet' rivers. In twenty-one comparisons, computations and measurements were within computed probability limits of depth of 10-1%. (Knapp-USGS)

DISCHARGE OF SUSPENDED SEDIMENTS AS A FUNCTION OF HYDROLOGIC CHARACTERISTICS,
N. N. Bobrovitskaya.
Soviet Hydrol: Selec Pap, No 2, pp 173-183, 1967. 11 p, 5 fig, 5 tab, 9 ref. Translation from Trudy GGI, No 141, pp 107-120, 1967.

Descriptors: *Sediment discharge, *Rivers, *Floods, Discharge (Water), Peak discharge, Hydrographs.
Identifiers: USSR, Polomet River, Flood Rise-sediment discharge relationships.

Mean annual suspended sediment discharge of the Polomet and other USSR rivers was investigated as a function of hydrologic characteristics, particularly of the rise of spring flood water. No unique relation between water discharge and sediment discharge was found. In most but not all stretches of the river sediment discharge was larger with rising than with falling water. The rate of rise of flood waters correlated strongly with sediment discharge, however. On a plot of sediment discharge against rate of floodwater rise the scatter was less than 30% all years except 1964, when it was 37%. Other rivers show generally similar relationships. (Knapp-USGS)

SPECIFIC DISCHARGE OF ENTRAINED SEDIMENTS,
K. I. Rossinskiy.
Soviet Hydrol: Selec Pap, No 2, pp 152-158, 1967. 7 p, 2 fig. Translation from Trudy GGI, No 141, pp 35-42, 1967.

Descriptors: *Sediment discharge, *Bed load, *Unsteady flow, Open channel flow, Velocity, Particle size, Particle shape, Roughness (Hydraulic), Probability.
Identifiers: USSR, Pulsating flow.

A formula is proposed for computing the discharge of bed load sediments under the influence of velocity pulsations. Discharge is a function of compactness of particle motion, defined as the ratio of instantaneous volume of moving particles to total volume of the layer in which motion occurs. Compactness is determined by particle shape, the degree to which the bottom surface is shielded from scour by roughness elements, and the proportion of time the pulsating flow exceeds threshold particle-displacement velocity. In the analysis presented, shape and roughness are treated as constant. The equations relate discharge to velocity for each particle size present in the sediment by use of Gaussian probability curves to estimate the part of the pulsating flow exceeding scour threshold. Water Resources Res, Vol 3, No 4, pp 1041-1046, 1967. 6 p, 1 fig, 7 ref.

Descriptors: *Meanders, *Thermodynamic behavior, Statistical methods, Stochastic processes.
Identifiers: Thermodynamic analogy.

A thermodynamic analogy for meander systems can be set up such that analogs of temperature, entropy, and free energy can be defined, based on the statistical aspects of meander formation. Meanders seem to be related to the fact that a river has a finite probability to deviate from a straight course, and the probability distribution of deviation is Gaussian. There is a great similarity between this statistical problem and an analogous one in the kinetic theory of gases. Solutions to gas dynamics problems can be used in solving problems of development of meander systems. (Knapp-USGS)

SPECULATIONS CONCERNING PALEOHYDROLOGIC CONTROLS OF TERRESTRIAL SEDIMENTATION,
Colorado State Univ, Fort Collins, and U. S. Geological Surv, Washington, D. C.
S. A. Schumm.
Geol Society of Amer Bull, Vol 79, No 11, pp 1573-1588, Nov 1968. 20 p, 1 tab, 4 fig, 5 photo, 63 ref.

Descriptors: *Paleohydrology, *Hydrologic data, *Sedimentation rates, *Vegetation effects, Cenozoic Era, Sediment load, Channel morphology, Climatology.
Identifiers: *Terrestrial sedimentation, Phytologic data, Speculations.

A variety of hydrologic data and geomorphic observations were reviewed and used to speculate on the changes in the hydrologic cycle, river morphology, and fluvial sedimentary deposits during geologic time. Prior to significant vegetal cover, denudation and runoff rates were high and floods were large, and coarse sediments were spread as sheets over piedmont areas. With appearance of terrestrial vegetation and its colonization of the land surface, erosion rates decreased, as did runoff and flood peaks. Alluvial deposits became stabilized, but large floods caused periodic flushing of sediment from the system, thereby creating sedimentary cycles of deposits. The influence of climate change on volume and type of sediment moved from an erosional system became more pronounced as the effect of vegetation on the hydrologic cycle increased. As grasses developed during the Cenozoic Era the relations between climate, vegetation, erosion, and runoff became like today except for man's influence. Diagrams, graphs, and photos show hypothetical series of rainfall-runoff relationships during geologic time and bed-load and suspended-load stream channels of today. (Lang-USGS)

OCCURRENCE OF POOLS AND RIFFLES: AN ELEMENT IN THE QUASI-EQUILIBRIUM STATE OF RIVER CHANNELS,
Western Ontario Univ, London, Ontario, Canada.
Raymond K. Dolling.
Ontario Geogr, No 2, pp 3-11, 1968. 9 p, 2 fig, 2 plate, 3 tab, 7 ref.

Descriptors: *Streambeds, *Channel morphology, *Energy losses, *Statistical methods, *Regression analysis, Mannings equation, Depth, Roughness (Hydraulic), Velocity.
Identifiers: Pools and riffles.

A sequence of 15 pools and 15 riffles on Bronte Creek, Ontario, was studied to determine objective criteria to be used to distinguish pools and riffles and to determine their relation to energy distribution in the stream. The dimensionless

LIBRARY U. OF I. URBANA - CHAMPAIGN

velocity/depth ratio was chosen for use in the analysis because it is easily determined and it may easily be compared with values from other areas. It is subjectively apparent that low values of velocity/depth correlate with pools, and high values with riffles. A multiple regression analysis was made with velocity/depth as the dependent variable and slope/width and roughness as independent variables. The predictive value of the independent variables is 96%. The model fails to explain the relation of power expenditure in pools and riffles because it does not include water surface slope as a variable. To explain scour in pools it is subjectively evident that high flows, slope in pools must be greater than over riffles, so that equal energy is expended in each. (Knapp-USGS)

PRELIMINARY APPRAISAL OF STREAM SEDIMENTATION IN THE SUSQUEHANNA RIVER BASIN,
U S Geol Surv, WRD.
K. F. Williams, and J. R. George.
U S Geol Surv open-file rep, 49 p, Mar 1968. 11 fig, 6 tab, 31 ref.

Descriptors: *Sedimentation, *Reservoir silting, *Pennsylvania, Particle size, Sediment yield, Provenance, Mining, Farms.
Identifiers: Susquehanna River Basin.

Analyses of stream-sediment discharge measurements collected in the Susquehanna River basin up to October 1965 are used to describe the sediment yield of major tributaries. The Susquehanna carries 110 tons of sediment per sq mi of its drainage basin, ranging from 30-950 tons per sq mi in glaciated terrain and from 37-500 in unglaciated areas, with the highest yields from farmland in the Piedmont. Coal mining contributes sediment, but apparently no more than other cleared-land activities. Available data suggest that forest cover and overland runoff are the 2 principal factors that determine stream sedimentation rates throughout most of the basin. Knowledge of these 2 variables permits prediction of the annual sediment yield of basins in unglaciated terrain with an average error of about 25%. The sediment consists of 15% sand, 55% silt, and 30% clay. Piedmont streams carry more silt and clay than other streams in the basin. Reservoir silting is slight, but small reservoirs and recreation pools in larger reservoirs have some problems. Reservoir sedimentation surveys suggest a long-term downward trend in sedimentation rates since the 1930's. (Knapp-USGS)

CHEMICAL CHARACTER OF GROUND AND SURFACE WATERS IN RELATION TO SOIL WEATHERING PROCESSES,
New Hampshire University, Durham.
A. B. Prince, and H. Chien.
Project Completion Report. Report, Water Resource Res Center, N H Univ, Durham, 7 p text, 31 tab, 8 append. June 1968, 46 p, OWRR Project A-002-NH.

Descriptors: *Soil water, *Water chemistry, *Weathering, Leaching, Iron, Movement, New Hampshire.

Study of the soil water chemistry of a wooded site on the bank of Oyster River, New Hampshire, showed that dissolved solids are removed from the area at a maximum rate of about 140 tons per year per sq mi with approximately 120 tons from rock dissolution and 20 tons from rainfall and human sources. The relationship of silica to discharge suggests that 10-12 ppm silica may be a criterion for determining when all streams flow is from ground water. Where the soil was well-drained and aerated, the contribution of iron to the river water was small. Where the soil was very poorly drained and aerated, the concentration of iron in the soil water was high and probably was a major source of the iron in the river water. As flow from the wetland increases, iron and organic content increase but pH and alkalinity decrease. Studies of the movement of iron in well-drained Melrose soil showed that the amount of iron in solution was relatively low and diminished with depth, resulting in a net accumulation of iron at an average depth of 2 in.-8 in., and iron released to the soil solution at or near the soil surface did not penetrate the top 16 in. of soil over an 84-day period under conditions of relatively high precipitation (10.32 in.), warm temperature (70-80 F) and absence of large channels. SOLUBILITY EQUILIBRIA INVOLVING METAL OXIDES AND CORRESPONDING AQUEOUS METAL PERCHLORATES,
North Carolina Univ., Chapel Hill, Chem Dept.
Forrest C. Hentz, Jr.
Water Resour Res Inst Rep 7, 1967. 16 p, 2 fig, 3 tab, 26 ref. OWRR Project A-005-NC.

Descriptors: Equilibrium, *Turbidity, *Titanium, Supersaturation, *Chemical precipitation, *Polymers.
Identifiers: *Hydrolytic polymers, Light-scattering method, Polymerization.

Light-scattering measurements at 25 deg C on Th (NO sub 3) sub 4 solutions containing 0, 1, 2, and 3 bound hydroxyls per thorium atom hydroxyl number have been made over the range 0.01-0.10M in total Th with each solution also 1.0M in NaNO sub 3. The weight-average degree of polymerization calculated for each stage of hydrolysis agrees essentially with that found previously for a perchlorate medium; however, estimated charges at the lower hydroxyl numbers are substantially less, indicating complexing of the thorium species by nitrate. Results indicate equilibrium solutions and degrees of polymerization near unity at hydroxyl numbers 0 and 1, and degrees of polymerization of 3-4 at hydroxyl number 2. At hydroxyl number 3, a degree of polymerization near 120 was found for clear solutions aged approximately 1 month; after an additional 2-month aging period, an increase of some 25% in molecular weight was observed, with solutions of Th concentration above 0.07M showing faint visible turbidity. Some preliminary kinetic measurements for thorium solutions hydrolyzed to hydroxyl number greater than 3 are reported.

THE SPECTROPHOTOMETRIC DETERMINATION OF NITRATE IN WATER USING 2-NITROSO-1-NAPHTHOL-4-SULFONIC ACID.
Southern Illinois Univ, Carbondale.
Frank N. Abercrombie, and Albert L. Caskey.
Proj Rep, June 1966. 15 p, 3 fig, 5 tab, 3 ref. OWRR Project A-014-Ill.

Descriptors: *Water analysis, *Chemical analysis, Water chemistry, Chemical reactions, *Nitrates, *Spectrophotometry, Spectroscopy, Analytical techniques, Absorption, Ultraviolet radiation.
Identifiers: Infrared spectroscopy.

2-Nitroso-1-naphthol-4-sulfonic acid reacts quantitatively in a few minutes with excess nitrate in a dilute, acidic, aqueous medium to form 2,4-dinitro-1-naphthol. The work reported here concerns the determination of conditions under which nitrate reacts quantitatively with an excess of standard 2-nitroso-1-naphthol-4-sulfonic acid. The establishment of such a set of conditions indicates the feasibility of developing a spectrophotometric method for the determination of nitrate based on its reaction with 2-nitroso-1-naphthol-4-sulfonic acid. Reagent grade chemicals meeting American Chemical Society specifications were used whenever they were commercially available. All other chemicals were of the highest grade available. Equipment and procedures are described and results indicate that it is feasible to develop a method for the spectrophotometric determination of nitrate utilizing 2-nitroso-1-naphthol-4-sulfonic acid.

ROLE OF CERTAIN STREAM-SEDIMENT COMPONENTS IN RADIOION SORPTION,
U S Geological Survey.
E. A. Jenne, and J. S. Wahlberg.
U S Geol Surv Prop Pap 433-F, pp F1-F16, 1968. 16 p, 4 fig, 7 tab, 41 ref.

Descriptors: *Sorption, *Dialysis, *Radioisotopes, Clay minerals, Carbonates, Oxides, Cobalt radioisotopes, Cesium, Strontium radioisotopes.
Identifiers: Radioion sorption (Sedimentary), Ion manganese.

'Natural' and laboratory 'dialysis' mass-action selectivity coefficients were determined for the sediment fractions smaller than 0.25 mm and for the 2-0.25 mm sediment fractions to evaluate the comparability of these 2 types of selectivity coefficients and the effectiveness of nonclay components in controlling the distribution of radioions between solid and liquid phases. Stream water and surficial bed sediment were sampled in Whiteoak Creek, Tenn, which carries low-level-radioactive waste waters from Oak Ridge National Laboratory. Appropriate mass-action selectivity coefficients were calculated. Sr-90 sorption was controlled by precipitated carbonates. The selectivity coefficient was 9.6 for the natural carbonates and 1.2 for laboratory dialysis. Co-60 sorption was controlled by Mn and Fe oxides and the natural selectivity coefficients were the higher. Cs-37 sorption was controlled by clay minerals, with higher natural selectivity coefficients. Natural and laboratory selectivity coefficients were not comparable in many instances. This is attributed to partial dissolution of finegrained carbonates and of manganese and iron oxides, and in part to the largely irreversible nature of cobalt-60 and cesium-137 sorption. The laboratory and the natural selectivity coefficients for cesium-137 agreed within a factor of 2. (Knapp-USGS)

MUNICIPAL LIQUIDATORS, INC V TENCH (AVULSION AND EROSION).

153 So 2d 728-731 (Fla DCA 1963).

Descriptors: *Florida, Avulsion, Erosion, Judicial decisions, Bank erosion, *Boundary dispute, Boundaries (Property), High water mark, *Ownership of beds, Beds, Beds under water, Water law, Riparian rights.
Identifiers: *Government lots, *Tampa Bay.

This was a suit in chancery for a declaratory decree. Defendant owned a government lot bordering on Tampa Bay. The government survey of 188 showed that at that time defendant's governmen lot included land between plaintiff's property and the waters of Tampa Bay. This part of defendant's lot is now submerged, so that plaintiff's property extends to the water's edge. Plaintiff now seeks to purchase the submerged land in front of his property, including what was formerly part of defendant's government lot, for the purpose of filling. Th

ourt found that the now submerged part of defen-
lant's government lot had disappeared by erosion,
ence title reverted to the state. The court rejected
lefendant's contention that the land was lost by
vulsion, hence title remained in defendant. Where
and becomes submerged, erosion is presumed, and
he burden of proving avulsion is on the party alleg-
ng avulsion. The case discusses the distinction
etween avulsion and erosion. (Kirkconnell-Fla)

3B. Water Yield Improvement

WATER WELL YIELDS FROM CRYSTALLINE ROCKS OF NORTHERN NEW JERSEY,
Rutgers Univ., New Brunswick.
Bennett L. Smith, and Daryll A. James.
Dept Geol Pub 1968. 8 p, 4 tab, 6 ref. OWRR Project A-007-NJ.

Descriptors: Crystalline rocks, *Water wells, *Water yield, Gneisses, *Groundwater, *Permeability, Faults (Geology), Joints, Granites.
Identifiers: Diorite.

For more than 10 yr, a study has been carried out of the crystalline Pre-cambrian rocks which form the bedrock throughout some 1200 square mi of Northern New Jersey. This has resulted in a new geologic map of the region. As a byproduct of this work, a study of water well yields has been made in relation to lithology and structure, in order to provide guidelines for well development. This report includes an analysis of well yield with respect to rock type. It also includes certain findings as regards relationship of well yield to geologic and topographic structure. Further details including findings relative to structure will be incorporated in a publication, now being prepared.

WATER-RESOURCES APPRAISAL OF CLAYTON VALLEY-STONEWALL FLAT AREA, NEVADA AND CALIFORNIA,
U S Geological Survey, Washington, D C, Water Resources Division.
F. Eugene Rush.
Nev Dep of Conserv and Natur Resources, Water Resources-Reconnaissance Ser Rep 45, 54 p, May 1968. 3 fig, 1 plate, 16 tab, 34 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, Data collections, Hydrologic data, Water quality, Water yield, Nevada, California, Alluvium, Valleys.
Identifiers: Clayton Valley-Stonewall Flat area, Nevada.

A reconnaissance water resources study was made of the Clayton Valley-Stonewall Flat area of Nevada and California. The area 80 miles north to south and 60 miles east to west, has a population less than 1,000. The valleys are bounded by mountain ranges about 9,000 ft high. Most of the available groundwater is stored in valley-fill alluvium, which is 600 or more ft thick. The valley flats receive about 5 in. precipitation a yr; most recharge is stream water from the mountains, where precipitation is as high as 15 in. per yr. Perennial yield is estimated to be 22,000 acre-ft per yr in Clayton Valley and from 100-3,000 acre-ft per yr in the smaller valleys of the area. Present groundwater development in the area is only 2,090 acre-ft per yr. The water is of fair to poor quality for agricultural use and marginal in quality for drinking. Chloride, sulfate and TDS are excessive. Tabulated data include hydrologic, topographic, climatic, and drainage summaries, runoff, evapotranspiration, pumpage, groundwater budgets, chemical analyses, perennial yield, transitional storage reserve, well data, spring data, and drillers' logs of wells. MANAGEMENT OF HYDROLOGIC SYSTEMS FOR WATER QUALITY CONTROL,
California University, Berkeley, Water Resources Center.
Philip C. Woods.
Calif Univ Water Resources Center Contrib No 121, 121 p, June 1967. 39 fig, 4 tab, 56 ref, 1 append. OWRR Project A-004-Cal.

Descriptors: *Water quality control, *Management, *Simulation analysis, *Model studies, Mathematical models, Linear programming, Systems analysis, Irrigation practices, California, Flow augmentation.
Identifiers: *Hydrologic systems, Sacramento River, Hydrologic models.

Management of hydrologic systems entails not only the design and construction of physical works for supplying water and removing waste water but considers the impact of these operations on water quality throughout the system. As an example of hydrologic system behavior, irrigation systems, which may be represented as controlled hydrologic entities, were examined. A systematized approach for predicting the quality response of these systems to changes in irrigation practice was proposed, and a series of mathematical models through which river system operation could be simulated on a digital computer was suggested. These models were described, and results obtained by simulation of the Sacramento River System were compared to the quality response of the prototype. Among the parameters which could be manipulated for system management, flow augmentation and ground water elevation control were shown to be significantly effective. The most dramatic changes in system response, however, resulted from changes in irrigation operations. Simulation approaches lead to the ultimate management goal of optimization techniques. WATER CONSUMPTION BY PHREATOPHYTES,
Arizona Univ., Tucson. Dept. of Watershed Management.
Paul G. Sebenik, and John L. Thames.
Prog Agri, Vol 14, No 2, pp 10-11, March-April 1967. 2 p, 1 tab.

Descriptors: *Phreatophytes, *Arid climates, *Consumptive use, *Transpiration, Evapotranspiration, *Tamarisk, Water loss, Evaporation pans, Measurement, Brush control, Arizona.
Identifiers: Tents.

Phreatophytes in the 17 western states occupy about 15 million acres of stream bank and river bottom sites and consume large quantities of water. Transpiration by tamarisk shrubs occupying a narrow flood plain near Winkleman, Arizona, was measured during the summer of 1966 by the tent technique. On all days of measurement, evapotranspiration from areas enclosed by the tent exceeded pan evaporation. An average monthly loss of 1.1 acre-feet of water per acre occurred from July to September. Suggestions on how this water could be salvaged for more valuable use were given together with problems that arise when phreatophytes are removed from river channels. Since phreatophytes occur in large numbers along streams and rivers in arid areas, their contribution to water losses that occur in these areas must be studied and understood. (Blecker-Ariz)

ATTRACTION OF ATMOSPHERIC MOISTURE BY WOODY XEROPHYTES IN ARID CLIMATES,
Volcani Institute of Agricultural Research, Rehovot, Israel.
I. Gindell.
Commonwealth Forest Rev, Vol 45 (4), No 126, pp 297-321, December 1966. 25 p, 11 fig, 8 tab, 33 ref.

Descriptors: *Arid climates, Moisture tension, *Soil moisture, Soil-water-plant relationships, Precipitation (Atmospheric), *Xerophytes, *Tamarisk, *Meteoritic water, Dry seasons, Wet seasons, Plant physiology, Humidity.
Identifiers: Ionic concentration, Moisture index, Israel.

The participation of atmospheric water in the arid climates with respect to the control of water shortage in woody xerophytes and in the reduction of moisture tension in the soil was followed in three ways: (a) By comparison of soil moisture in forest plantations with that of neighboring bare areas of identical make-up. (b) By comparing the fluctuations in soil moisture in the two areas during the dry and rainy seasons. (c) By investigation of the process of entry of water into the leaves, its passage into the stem and roots and the egress of the excess into the soil surrounding the roots. In the desert region, there was no reduction in the foliage of various species of tamarisk during the driest and hottest months of the year. In the desert, in deep sands, absorption from great depth (270cm) was possible owing to the gradual decrease in moisture with depth. (Blecker-Ariz)

PREPARED WATER CATCHMENTS,
G. H. Young.
J Agr S Australia, Vol 69, No 2, pp 73-77, September 1965. 5 p, 1 tab, 7 photo.

Descriptors: *Arid climates, *Watersheds (Basins), *Runoff, *Water conservation, *Costs, Grading, Erosion control, Contour furrows, Dams, Weed control, Roads, Channels.

Two methods are described which have been used to increase runoff and improve catchments of farm dams in the Eyre Peninsula of South Australia. The road-type catchment is a series of roads side-by-side across the slope of the land. It is found to be extremely effective in flat areas where runoff does not occur except after heavy storms. Cost for each stage of the catchment construction is given. The contoured catchment is used in hilly country with slopes ranging from 5-15%. Cost of constructing a contour catchment is similar to the road-type catchment. These methods are but two more ways in which water harvesting can be done in arid climates. (Blecker-Ariz)

LIBRARY U. OF I. URBANA - CHAMPAIGN

Identifiers: Dusting.

This paper examines the cost of increasing the capacity of farm ponds by suppression of evaporation through use of monomolecular films of long-chain fatty alcohols. Cetyl alcohol and stearyl alcohol were found to be among the most effective compounds for reducing evaporation and were the most promising in regard to cost and availability. In order to estimate cost of water saved by evaporation suppression, both amount of evaporation and percent reduction obtained for given treatintg conditions must be known. Summaries of many field test observations were presented in a table together with a summary of cost assumptions and a comparison of treating method costs for a one-acre pond. Two hypothetical cases illustrated how data and procedures given in the paper could be applied. (Blecker-Ariz)

WATER RESOURCES OF DELAWARE COUNTY, INDIANA,
U S Geological Survey, and Indiana Department of National Resources.
R. E. Hoggatt, J. D. Hunn, and W. J. Steen.
Indiana Div of Water Bull No 37, 57 p, 1968. 23 fig, 1 plate, 8 tab, 27 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, Water quality, Aquifers, Data collections, Indiana, Water yield, Streamflow.
Identifiers: Delaware County (Indiana), Muncie (Indiana).

Delaware County, Indiana has ground and surface water resources of sufficient quantity and quality to meet present needs and predicted increased requirements for agricultural, domestic, and municipal use. Present use, 80% of which is Muncie municipal water, totals about 18.5 mgd of which 63% is from surface sources. Muncie's water supply is obtained from the White River, which flows more than 20 cfs or 13 mgd 90% of the time from a drainage area of 242 sq mi. Low flow is augmented by releases from Prairie Creek Reservoir. The Mississinewa River drains 304 sq mi and yields over 8 cfs 90% of the time; its development potential is good. Streams in the northern part of the county frequently go dry, but in the southern half, most yield over 0.013 mgd per sq mi 90% of the time, Buck Creek yields over 6.5 mgd 90% of the time. Aquifers within 400 ft of the surface yield neraly all the groundwater. Well can yield as much as 1,000 gpm in the south central and southwest. The principal aquifers are silurian dolomite, which yields up to 500 gpm, and Pleistocene sand and gravel, some of which fills buried valleys. The waters of the county are moderately hard. Some groundwater may have excessive iron. (Knapp-USGS)

WATER RESOURCES OF THE LETTSWORTH-INNIS-BATCHELOR AREA, POINTE COUPEE PARISH, LOUISIANA,
U. S. Geological Survey.
A. H. Harder, V. B. Sauer, and W. L. Broussard.
Louisiana Dep of Conserv Geol Surv and Dep of Public Works Water Resources Pam No 21, Jan 1968. 1 plate, 6 tab, 6 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, Data collections, Water quality, Water yield, Louisiana, Mississippi River Basin.
Identifiers: Pointe Coupee Parish (Louisiana).

Large quantities of surface and groundwater of good quality are available in Pointe Coupee Parish, Louisiana. The nearby Mississippi River has an average flow of about 600,000 cfs and a minimum flow of about 75,000 cfs. Dissolved-solids concentrations in the river range from about 110 to 400 ppm, hardness from 70 to 200 ppm, sediment from 50 to 3,500 ppm, and pH from 6.7 to 8.2. Raccourci Old River, which is connected to the Mississippi River, contains about 15 to 30 billion gal of water, depending on its stage and that of the Mississippi River. The quality of its water is similar to that of the Mississippi River. Large quantities of fresh groundwater are available from underlying sands in thickness from 20 to more than 100 ft. Large-diameter wells may yield as much as 1,500 gpm each, with specific capacities up to 75 gpm per ft of drawdown. Groundwater levels range from a few ft below land surface in wells screened at depths of 50-400 ft deep to as much as 15 ft above land surface in wells screened from 1,000 - 1,200 ft deep. The quality of groundwater improves with depth. Wells less than 400 ft deep usually yield a calcium bicarbonate type water that is hard and high in iron. Deeper wells (400 to 1,200 ft) usually yield a softer, sodium bicarbonate water having a hardness of 4 to 80 ppm, less iron (0.00 to 1.4 ppm), and a pH of 7.0 to 8.8. (Knapp-USGS)

3C. Use of Water of Impaired Quality

ENGINEERING ASPECTS OF THE RECLAMATION OF SODIC SOILS WITH HIGH-SALT WATERS,
Dept. of Agriculture, Mandan, No. Dakota, Agricultural Research Service.
Eugene J. Doering, and Ronald C. Reeve.
J Irrigation and Drainage Div, ASCE, Vol 91, No IR 4, Proc Paper 4588, pp 59-72, Dec 1965. 14 p, 6 fig, 2 tab.

Descriptors: *Saline water, *Alkaline soils, Fine-textured soils, *Land reclamation, Hydraulic properties, Hydraulic conductivity, *Leaching, Electrolytes, *Sodium, Soil chemistry, Soil profiles, Infiltration, Ions, Cation exchange, Percolation, Permeability, Equations, Gypsum.
Identifiers: *Engineering aspects.

A laboratory study was conducted to show that sodic fine-textured soils were impossible to reclaim by applying gypsum to the surface and that the high-salt-water dilution method was effective within limits. A combination of the two methods appeared to be both effective and practical. Basic principles and calculation procedures involved in the engineering evaluation of a reclamation program were presented. Hydraulic properties of sodic soils were functions of both electrolyte concentration of the leaching solution and exchangeable-sodium status of the soils. They were also dependent on the previous history of the sample. Therefore, estimates of time needed for reclamation must still be based on empirical determinations of the infiltration rate for the soil in question. (Affleck-Ariz)

USING SALT TO INCREASE IRRIGATION WATER,
Arizona Univ, Tucson, College of Agriculture.
Brent C. Cluff, and Gordon R. Dutt.
Reprint, Prog Agr Ariz, Vol 18, No 3, pp 12-13, May-June 1966. 3 p, 4 fig. OWRR Project A-001-ARIZ.

Descriptors: Watershed management, *Water yield, Water storage, Water utilization, Sodium chloride, Soil sealants, *Runoff, Irrigation water.

Sodium chloride was added to soil material in pans and on a field plot. It was found that the 'Mo' effectively dispersed and sealed the surface, thus increasing runoff. During the last half of the winter rainfall period, runoff was 25 times greater on the treated plot than on the check plot. Of the 2.90 in. of precipitation, 10.3% was measured as runoff from the treated plot. The runoff from the salted plot contained less than 200 ppm dissolved salts. It was estimated that the treatment cost could be below $12.00 per acre.

FEDERAL PROJECTS FOR IRRIGATION AND WATER SUPPLIES.

43 USCA Secs 390-390f (1964).

Descriptors: *Legislation, *Federal project policy, *Cost allocation, Irrigation programs, Federal Reclamation Law, Cost repayments, Federal government, State governments, Local governments, Water resources development, Leases, Dams, Reservoirs, Reservoir storage, Water storage, Water rights, Water policy, Cost-benefit theory, Projects, Water supply.
Identifiers: *Secretary of the Interior, Secretary of the Army, Corps of Engineers, Bureau of Reclamation.

Whenever the Secretary of the Army determines that any dam or reservoir project under his direction may be used for irrigation purposes, the Secretary of the Interior is authorized to construct and maintain such additional works in connection therewith as he may deem necessary for irrigation purposes. These works may be undertaken only after specific authorization by Congress. Section 390b declares that it is the policy of Congress to recognize the primary responsibilities of state and local interests in developing water supplies and that

he Federal Government should cooperate with the tates and local interests. Section 390b also conains several provisions for the determination and llocation of costs on such projects. The other secions deal chiefly with the acquisition of rights in uch projects by state and local interests, their bligations for operation, maintenance, and costs, nd with contracts and lease revisions concerning hese rights and obligations. The source includes istorical notes and notes of decisions, and is kept p to date with annual supplements. (Smodish-Fla)

IOOVER V CRANE (REASONABLE USE RULE APPLIED TO IRRIGATION).

62 Mich 36, 106 NW 2d 563-566 (1960).

Descriptors: *Michigan, Civil law, Judicial decions, Irrigation, Irrigation effects, Effects, Evaporation, *Reasonable use, Artificial use, Competing uses, *Riparian rights.

Plaintiff owned a lake-front cottage. Defendant's arm also fronted on the lake, occupying about ten ercent of the lake frontage. In the summertime the vater level of the lake often fell so low that the flow t the lake's single outlet ceased. During one such ry period, defendant began pumping water from he lake for irrigation purposes. Plaintiff sued, laiming that the drop in the lake level that summer as due to defendant's irrigation activities. Defendant contended it was due to natural causes, and hat the irrigation was of great benefit to him and ontributed only slightly to plaintiff's discomfiture. The court, employing the reasonable use rule, held hat an injury that is incidental to a reasonable enoyment of a common right can demand no redress. The reasonableness of the use is determined by its xtent, duration, necessity, and application; the naure and size of the stream, and the several uses to which it is put; the relative injuries and benefits to he various riparian owners; and all other material acts. The court held the defendant's use to be easonable, but affirmed an order of the lower ourt restricting the defendant to removing no nore than one quarter-inch from the lake during hose periods when the level of the lake fell below he level where it flowed from the lake's outlet. MAXIMUM AND OPTIMUM NORMS OF BOG DRAINAGE (RUSSIAN),
A. I. Ivitskii.
Transl by Israel Program for Scientific Transl (IPST) 1968, Cat. No. 1988. Available from CFSTI as TT 67-51317. Trans from Gidrotekhnika: Melioratsiya, No 12, pp 33-42, 1962. 11 p, 2 fig, 4 tab, 16 ref.

Descriptors: *Drainage effects, *Marsh management, *Soil physical properties, *Soil chemical properties, Soil water, Soil-water-plant relationships, Dewatering, Drainage wells, Furrow drainage.
Identifiers: USSR, Bog drainage.

An investigation of the relation between depth of bog drainage and agricultural productivity shows that in many cases productivity is higher with drainage to depths of 350-450 cm than with the more commonly used drainage depths of 130-150 cm. Further depression of water levels to 220-260 cm yielded no further improvement and in some cases caused lower yields. For intertilled crops, including spring wheat, sugarbeet, potatoes, and cabbage, average water depth should be at least 60 cm in April and 100 cm the rest of the growing season. For hemp, depth should be at least 62 cm in April and 112 cm the rest of the growing season. The optimum air regime of the soil occurs with a water depth of 120-130 cm, and the maximum tolerable carbon dioxide level occurs with a water depth of 100 cm. (Knapp-USGS)

DEVELOPMENT OF METHODS FOR INCREASING THE EFFICIENCY OF WATER USE IN CRANBERRIES,
Massachusetts Univ., Amherst, Cranberry Exp Sta.
John S. Norton.
Pap, Symp Water Resour Res, June 1967. 16 p, 15 fig, 1 tab. OWRR Project A-005-Mass.

Descriptors: *Cranberries, *Dikes, Irrigation systems, Irrigation efficiency, *Flood irrigation, *Water harvesting, Bogs, Equipment.

Materials were procured for an assortment of temporary dikes for cranberry bogs and 7 dikes were built. Two dikes were vinyl sheeting supported on railings and anchored below ground by 1 by 2 in. wood strips. One dike was aluminum, supported by a wood railing. Three dikes were earth with sheet aluminum cores. Two of the earthen dikes were built over filled-in ditches, the third built on bog surface. The seventh dike was erected on private property but removed prior to testing. Only the sheet vinyl and aluminum dikes were constructed in time for testing in 1966. Considerable difficulty was experienced because of washouts under both the vinyl and aluminum sheeting. Tests will be made on all dikes in 1967 in conjunction with work under Hatch Project No 51. The current trend toward water harvest methods. The equipment consists of an elevator to remove the berries from the water surface, and a blower, ducting, and screen to separate debris from the berries before they are loaded into trucks.

SEALING PONDS CHEMICALLY,
Tennessee Univ., Knoxville.
John I. Sewell.
Agricultural Engineering, Vol 48, No 5, pp 270-71, May 1967. 2 p, 1 fig, 2 photo.

Descriptors: *Ponds, Permeability, *Chemicals, *Sealants, Evaporation control, Ion exchange, Dispersion, *Soil sealants, Farm ponds.

Effectiveness of chemical treatment in sealing ponds against water loss was evaluated on the basis of resulting reduction in permeability of the soil sample. In many cases permeameter discharge rates were taken for 30 or more days before discharges approached steady-state condition. In tests where treatments were ineffective, permeability rates (K) always tended to increase with time. Results of sodium chloride treatments indicated that K decreased for about one week, then rapidly increased. This may be because the reaction between sodium and calcium ions in the soil produces calcium chloride, which is highly soluble in water. As the calcium chloride dissolved, a reversal of this reaction took place. Principles, objectives and procedures of sealing ponds chemically were outlined. (Blecker-Ariz)

EFFECT OF IRRIGATION METHOD ON WATER CONSERVATION,
Utah State Univ., Logan.
Jack Keller.
J of Irrigation and Drainage Div, ASCE, Vol 91, No IR2, Proc Paper 4364, pp 61-72, June 1965. 12 p, 1 fig, 7 tab.

Descriptors: *Irrigation effects, *Water conservation, *Irrigation efficiency, Sprinkler irrigation, Cost analysis, Arid lands, *Economic efficiency, Surface irrigation, Comparative costs, On-site investigations, *Farm management.

Water use efficiency and economic factors as a basis for the selection of irrigation methods for farm systems and projects were examined. A brief review of comparative studies of water application and operational efficiencies was presented. A review of comparative irrigation costs demonstrated the relative cost between methods and facilities when the limiting resource was land or water. The effect of methods on the management of both farms and projects was also considered. A major problem in soil and water conservation in arid regions throughout the world is how adequate but not excessive depths of irrigation water can be economically applied to soils. (Affleck-Ariz)

BASIN FORMING AND RESEEDING OF RANGELAND,
Dept. of Agriculture, Tucson, Soil Conservation Service.
K. R. Frost, and Louis Hamilton.
Trans. Amer Soc Agr Eng, Vol 8, No 2, pp 202-203,207, 1965. 3 p.

Descriptors: *Basins, Planting management, Vegetation regrowth, Semiarid climates, Range grasses, *Revegetation, *Mechanical equipment, Arid lands, *Desert plants, *Soil moisture, Ranges, Soil-water-plant relationships, Seeds, Wet seasons, Dry seasons.
Identifiers: Semidesert, *Reseeding, *Basin forming.

Improvement of semidesert ranges through reseeding is usually unsuccessful because of poor soil moisture conditions. Three mechanical systems for improving success of semidesert ranges were developed and evaluated. The systems were: forming and seeding fan-shaped basins, basin-forming on knifed rangeland and seeding in pits formed by a pitting disk. Sloping fan-shaped basins were a practical device for collecting rainfall for range grass seeding if the soils were suitable. Such basins were formed at a low cost with a tractor and blade designed for this purpose. Moisture penetration of 30 inches in medium soils was possible with four or five high-intensity storms of less than one-half inch each and totaling two inches. Appropriate basins were pressed into loose knifed rangeland by a blister roller. (Blecker-Ariz)

ASPECTS OF SURFACE WATER RESOURCES - HUMBOLDT RIVER BASIN, NEVADA.
Nevada Univ, Reno.
D. F. Schulke, G. B. Maxey, and P. A. Domenico.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Water Resour Res Center, Desert Res Inst, Proj Rep 6, Aug 1967. 57 p, 14 fig, 1 tab, 14 ref. OWRR Project A-011-Nev.

Descriptors: *Reservoir storage, *Irrigation water, *Water demand, *Water management (Applied), *Administration, *Surface water, Water permits, Irrigation efficiency, Flood irrigation, Appropriation, Water resources, Nevada, Conjunctive use.

Most streamflow for Humboldt River originates in the Upper Valley Unit, or headwaters in Ruby Range in extreme north eastern part of Nev., and the lower country, north and east sides of the basin with varying water rights for quantity/acre, legth and type application. The river is essentially uncontrolled throughout its course except for one major control structure at Rye Patch just above terminal Humboldt Sink. However, there are at least 16 possible reservoir sites in addition to three reservoirs authorized for construction in the Upper Valley Unit, which could be operated beneficially for irrigation purposes and still operate within flood control capacity as shown by operational studies. Another proposal for supplementation of surface water is that of pumping ground water during periods of deficient streamflow. This would tap highly permeable gravel, which in turn would be rapidly replenished during frequent periods of natural flooding. Preliminary results of studies indicate there is a very good possibility of success for conjunctive use of ground and surface waters. Some type of management body, to be decided after review of possibilities and effectiveness of each body in handling basin problems, will be required if either upstream storage or conjunctive use is implemented in the basin to better utilize water resources. (J. Phoenix-Nevada).

AGRICULTURAL RESOURCES RELATED TO WATER DEVELOPMENT IN TEXAS,
Texas Agricultural and Mechanical Univ, College Station.
J. R. Runkles, and E. T. Smerdon.
Water Resour Inst, Agri Exper Sta, Texas A and M Univ, Sept 1965. 171 p, 16 fig, 35 tab, 59 ref. OWRR Project A-001-TEX.

Descriptors: Agriculture, *Texas, *Water resources development, Crop production, Cultivated lands, Irrigable land, Irrigated land, Natural resources, Resource allocation, Long-term planning, Planning, Bibliographies.

Texas is now developing a state water plan which will be a basic guide for water resources development in Texas through the year 2020. A special task committee at Texas A and M University assisted the Texas Water Development Board in the evaluation of future agricultural water requirements and its relation to water availability. To develop projections of requirements which would be useful in planning water resource development, the analysis was initiated with four models of agricultural resource requirements and production. Each model includes: (1) restrictions on production, (2) assumptions relative to resource availability and use, and (3) estimates of output with the specified use of resources. This report includes discussion and data concerning Texas' resources and environment, and results of the first two models. The first model gives maximum physical capacity of agriculture in Texas with no economic, institutional, or water restrictions placed on production or marketing of products. The second model gives projected resource use and product output with water available to all irrigable acres, but limited by costs.

EVALUATION OF DRAINAGE PROBLEMS IN WATERLOGGED AREAS AND BOLSONS IN NEVADA,
Nevada Univ., Reno.
A. I. Kashef.
Water Resour Res Center, Proj Rep 1, Sept 1965. 12 p, 1 map, 5 ref. OWRR Project A-002-Nev.

Descriptors: Drainage practices, *Drainage water, Drainage districts, Drainage systems, *Drainage programs, Irrigation practices, Water reuse, Saturated soils, *Planning, Artificial recharge, Waste water.

Although existing local drainage systems in Nevada adequately drain presently irrigated lands (drainage of existing areas of high water use is only barely adequate), the prospect of large increases of available water, primarily as a result of surface-water importation, necessitates an evaluation of the need for and the manner of implementation of a general state drainage plan. Considered in this report are preliminary studies of primary importance to such an evaluation: (1) completion of a state soils map, (2) completion of a drainage map, (3) grouping of basins into regional drainage units, (4) evaluation of the water balance in selected basins in order to estimate the amount of water that can be naturally discharged, (5) reevaluation of current irrigation and drainage methods, (6) the possibility of establishing legal controls over the discharge of industrial wastes, and (7) a stepped-up program to determine the feasibility of recycling waste waters by means of ground water recharge. It is not the intention, however, of this report to present engineering solutions for current and anticipated drainage problems, but mainly to point out some of the more important aspects that need special attention.

REAL PROPERTY - WATER RIGHTS - LIABILITY FOR DISCHARGE OF SURFACE WATER,
Robert E. Hammell.
Mich L Rev, Vol 54, No 4, pp 574-577, Feb 1956. 4 p, 11 ref.

Descriptors: Surface drainage, *Surface runoff, *New Jersey, Civil law, *Judicial decision, Reasonable use, *Repulsion (Legal aspects), Water law, Legal aspects.

This is a case comment on Yonadi v Homestead County Homes, Inc, 35 N J Super 514, 114 A 2d 564 (1955). The corporate defendants purchased a forty-acre tract above the plaintiffs' golf course. Drainage had always flowed from the higher tract through the golf course. Defendant constructed a subdivision, increasing the runoff onto plaintiff's land by 350 per cent, and producing floods in heavy rains. Plaintiffs were awarded an injunction and damages at the trial level, and this was reversed. The civil law rule, common enemy rule, and the reasonable use rule are discussed. New Jersey is a 'common enemy' state. It is pointed out that no matter which rule a state uses, it usually arrives at the reasonable use result through various exceptions, limitations, etc. It is concluded that most courts, although they will not come out and say it, are moving toward the more flexible reasonable use approach to surface waters. Descriptors: *Wisconsin, Judicial decisions, *Cities, *Surface runoff, Surface drainage, Culverts, Embankments, *Natural flow.
Identifiers: Injunctions.

Appellants brought suit against defendant city to enjoin it from using a new drainage system which discharged water through a culvert under a railroad embankment into a pond on appellants' lands. Prior to the installation of the culvert, the natural drainage was such that, in the absence of the railroad embankment, it would have found its way into appellants' pond. The trial court denied relief, and the Supreme Court of Wisconsin affirmed. With regard to surface waters, cities have the same rights as individuals. As long as the city does not tap a new watershed or increase the volume, it may channel surface water in its natural direction. A city may even change the natural flow by the construction of streets and gutters as long as it does not collect water in a body and then cast it on private land. Appellants had not obtained a prescriptive right to have the embankment shield them from surface drainage since the element of reliance was lacking. Injunctive relief was not warranted because appellants suffered no irreparable injury. (R. F. Williams-Fla)

BEHM V KING LOUIES BOWL, INC (DRAINAGE OF SURFACE WATER).

350 S W 2d 285-291 (Mo 1961).

Descriptors: *Surface waters, *Drainage, *Drainage water, *Repulsion (Legal aspects), Water law, Legal aspects, Surface runoff, Riddance (Legal aspects), Floods, Rain water.

The main question in the tort action was whether the defendant was liable for damages caused by the manner in which surface water drained off its property. The court noted it is settled law that surface water is a common enemy which every man may ward off his land and throws on a lower owner, providing he does not collect it and discharge it to another owners damage. The defendant should have anticipated that the placement of railroad ties along the edge of his property would prevent water from being drained from the lot along the lines of natural flowage but would be diverted and caused to flow in a different channel in a damaging flood onto the plaintiff's lower property. The court held that the jury could have found the defendant guilty of actionable negligence and liable to the plaintiff for damage to his property for having caused it to be flooded in the manner that it was. (Horner-Fla)
W69-00827

CHAPPELL V WINSLOW (DIVERSION OF SURFACE WATER).
258 N C 617, 129 S E 2d 101-107 (1963).

Descriptors: *Drains, *Drainage systems, *Runoff, Drainage, Natural flow, Drainage effects, Floods, Surface water, Groundwater, *North Carolina.

The plaintiff sought to enjoin the defendants from altering the natural flow of water. The plaintiff claimed that if the defendant opened certain drainage ditches into the ditch running in front of his property, flooding could result and his land would be injured. The court affirmed the trial judge's finding that the plaintiff could be injured. In an action to enjoin one from collecting and discharging surface waters in volume, it is not necessary to prove that actual injury has already occurred. The remedy is preventive and may be had upon proof that the act complained of, unless restrained, will result in damage. (Horner-Fla)

Descriptors: *Repulsion (Legal aspects), Drainage, Surface runoff, Drainage water, Easements, Sewers, Subsurface drainage, Legal aspects.

The plaintiff and the defendant owned adjoining tracts of land. The plaintiff granted an easement to the city to build a sewer across his property. The defendant in the process of subdividing his property, dug a ditch on the easement to carry water off his land. The plaintiff sued for trespass to his land. The court held that the defendant was not entitled to build a ditch on the easement given to the city and the plaintiff was awarded damages in an amount equal to the cost of refilling the ditch and restoring the land. The court further noted that the defendant should be enjoined from discharging water collected through his sewer system upon the plaintiffs land. Under the common-enemy rule, one landowner may fend off surface waters without regard to his neighbor but he may not artificially collect and impound surface water and cast it in concentrated quantities onto the servient estate. (Horner-Fla)

Descriptors: *Surface water, *Drains, Watershed, Water flow, Gully, Conduits, Surface runoff, Time of concentration, Running water, *Surface drainage, Drainage, Culverts, Easements, Drainage effects, Drainage patterns, Drainage water, Subsurface drains, *Pennsylvania.

Action for continuing trespass against the township for the closing of a drain and the subsequent additional flow of surface water onto the plaintiff's property. Before the closing of the drain, three drains had carried water from the street down to the lake. The plaintiffs' property was at the lower end of the watershed. Before the drain was closed the plaintiffs had noticed some flooding of their property, but only at periods of hard rain. After the drain was closed a deep gully appeared along the line of the drain pipe that passed through the plaintiffs property making it unfit for any use. The plaintiffs had requested the township to take some action and commenced this suit only after the township refused to take any action. The township contended that they had the right to close and abandon any surface water drain without liability and that the plaintiffs' predecessor-in-title's consent release them from all liability. The court found that the closing of the drain caused more surface water to flow onto the plaintiff's property than had before and that the terms of the release should not be construed to cover matters which were not intended or contemplated, and therefore the township was liable. (Rief-Fla)

ARMSTRONG V WESTROADS DEVELOPMENT CO (SURFACE DRAINAGE).
380 S W 2d 529-538 (Ct App Mo 1964).

Descriptors: *Missouri, *Judicial decisions, *Surface runoff, Surface drainage, Streams, Riparian rights, Repulsion (Legal aspects), Natural flow, Culverts, Obstructions to flow.
Identifiers: *Non-riparian land.

Plaintiff Armstrong brought a suit for damages against Westroads Development Company and other defendants. Defendants, in connection with the construction of a shopping center, enclosed a natural stream in a concrete tube or culvert. The natural surface drainage fro.n plaintiff's property had gone into this stream, and consequently such waters backed up on his property, causing damage thereto. Although plaintiff's property did not bound on the stream, he claimed that he had a right to have the stream continue its natural flow, and that anyone obstructing that flow was liable for damages caused thereby. The court held that the

LIBRARY U. OF I. URBANA - CHAMPAIGN

right to the natural flow of a stream belonged only to a riparian owner thereon. Since plaintiff was a non-riparian owner he did not have a cause of action against defendant. The court pointed out that Missouri accepts a modified 'common enemy' rule as to diffused surface waters, and that if the landowner between plaintiff and the stream had so chosen he could have erected a barrier and completely repelled all drainage from plaintiff's land. (R. F. Williams-Fla)

PETERS V SHULL (COLLECTION AND DISCHARGE OF SURFACE RUNOFF).

379 S W 2d 837-842 (Mo 1964).

Descriptors: *Judicial decisions, *Missouri, *Surface runoff, Drainage, Surface drainage, Reasonabl use, Damages, *Alteration of flow, Water law, Legal aspects, Repulsion (Legal aspects).
Identifiers: Damages (Legal aspects).

Plaintiff brought suit against defendant for allegedly changing the grading and raising part of its adjoining lot, thereby artificially impounding water in one body and discharging it on plaintiff's land, causing damage. Defendant had begun construction of a house, and had changed the natural lay of the land. The trial court found for the plaintiff. Defendant appealed and the Kansas City Court of Appeals affirmed. The court said that a dominant owner may not allow surface water to accumulate on his property and then discharge it at a single point, damaging to the property of the servient owner. The evidence properly showed such actions in this case. The measure of damages is the difference in market value of the land immediately before and after the injury, where, as here, the injury is permanent and substantial. (R. F. Williams-Fla)

SPICER V WHITE BROS BUILDERS INC (DRAINAGE SYSTEMS).

193 N E 2d 274-279 (Ohio 1962).

Descriptors: Sewage, Septic tanks, *Sewage disposal, Titles, *Drainage systems, Channels, Sewage effluents, Damages, Earth dams, Surface water, *Ohio, Tile drainage, Ditches, Drainage water, Rivers, Watercourses (Legal).

This is an appeal by defendant from a judgment enjoining it from draining water or sewerage from Southwood subdivisions onto or across the lands of plaintiffs and ordering it to correct the drainage flow. The court here reversed stating that a preponderance of the evidence shows that the surface water draining into the ravine from the north end of Southwood consists with minor exceptions, of water which normally would have drained onto or across the lands of plaintiffs. Defendant corporation has merely collected this water and emptied it into the natural watercourse. The fact that such drainage, together with the other water draining therein, fills the old river bed is not due to any act of the defendant. The court also held that the defendant was not absolved by this action. The difficulty was that the plaintiffs failed to establish their claims by that degree of proof necessary to warrant this court to order the injunctive relief sought by plaintiffs. (R. Smith-Fla)

Descriptors: Surface drainage, *Drainage systems, Drainage water, Land development, *Ohio, *Watersheds (Basins), Drainage, Runoff, Streams, *Prescriptive rights, Floods, Flood damage, Diversion, Streamflow, Tiles, Municipal wastes, Surface water.

The court here affirmed a lower court decision dismissing the plaintiffs' petition to enjoin completion of a project to enlarge an existing surface drainage system. The court held that an upstream municipality may collect, by means of sewers, the surface water from a watershed area within the corporate limits and channel it into a natural watercourse which originates in or passes through such watershed area within the municipality, thus increasing the volume and accelerating the flow of water in the watercourse, without incurring liability to the downstream municipalities of landowners. The court also held that a continuous, open and adverse diversion of surface water from one watershed to another ripens into a prescriptive right after the passage of 21 years from the date the water is first discharged into the second watershed. DIVISION OF BEACHES AND SHORES: JURISDICTION, BOARD OF CONSERVATION, TRUSTEES OF INTERNAL IMPROVEMENT FUND,
Florida, Office of Attorney General, Tallahassee.
James Kynes.
Rep Att'y Gen Fla, 063-67, June 18, 1963.

Descriptors: *Administrative agencies, Adjudication procedure, *Florida, *Administration, Legislation, Beaches, Shores, State governments, State jurisdiction, *Jurisdiction, Beach erosion, Shore protection.

This opinion was in response to a question from the Director of the Trustees of the Internal Improvement Fund. The Director asked what effect Ch 63-40, Laws of Fla, which established the division of beaches and shores in the board of conservation, would have upon the duties of the Trustees in processing applications for installation of piers, docks, wharves, etc. The Attorney General responded that while the new law represented the most recent expression of legislative will as to who should have responsibility for the protection and restoration of beaches and shores, the structures mentioned by the Director were not for the purpose of restoration, conservation, or preservation of beaches and shores. Therefore the Trustees should continue to process applications for their installation. (R. F. Williams-Fla)

OCCURRENCE OF LARGE NEMATODE POPULATIONS IN IRRIGATION CANALS OF SOUTH CENTRAL WASHINGTON,
Washington State Univ., Prosser.
L. R. Caulkner, and W. J. Bolander.
Nematologia, Vol 12, pp 591-600, 1966. 12 p, 7 fig, 11 ref, disc. OWRR Project A-011-Wash.

Descriptors: Irrigation canals, Irrigation, *Sampling, Irrigation water, Water analysis, *Nematodes, Analytical techniques, Washington, Plant diseases, Plant pathology, Water pollution effects, *Soil contamination, Columbia River Basin.
Identifiers: Plant parasites.

Studies carried out during the 1965 season at Prosser, Washington showed the presence of large numbers of nematodes in irrigation water. Water samples were collected with a depth-adjustable sampling tube and nemas were extracted using modified screening and Baermann funnel techniques. Efficiency of the method was inversely proportional to the volume of water sampled. Distribution of nematodes within a canal was random as they did not concentrate in any portion of the canal and no tendency to settle out of flowing water was detected. Population densities in the Sunnyside and Roza Canals ranged from approximately 25 to 200 nemas/gal (3.775 l) of water depending upon the date of sampling. Estimates from these data indicate that from 2 to 16 x 10 to the 9th power nematodes per day were carried past a given point. Plant parasitic nematodes generally accounted for 10-20%of those extracted from innigation water with the highest concentration of these occurring during mid-season in the Sunnyside Canal.

DRY VALLEYS AND THE COMPOSITION OF THE DRAINAGE NET,
Exeter Univ. (England), Geography Dept.
K. J. Gregory.
J of Hydrol (Amsterdam), Vol 4, No 4, pp 327-340, November 1966.

Descriptors: *Valleys, *Watersheds (Basins), Channel flow, Linear programming, Drainage systems, *Channel morphology, Arid lands, Streams, *Networks, Regression analysis, *Drainage patterns (Geologic), Stream beds, Hydrologic data, Mapping, Least squares method.
Identifiers: Stream channels, Valley network, Drainage nets.

Many drainage basins in Devon, England, particularly in central and southeast Devon, include dry valleys and the problem of the exact composition of the drainage net is often encountered. Two maps were produced for the Otter drainage basin; one showing the existing network of stream channels and one showing the present network of valleys which included many dry valleys devoid of stream channel at the present time. The maps were analysed for number of streams and number of valleys respectively. The best fit by linear regression was provided by the numbers of stream channels mapped in the field. The analysis of the drainage net according to the first two laws of drainage composition showed that the laws were confirmed by the network of present stream channels. In several basins it would appear that the present channel network should be used in preference to the valley network as the latter includes valleys of different ages which developed and functioned at different times. laintiff sought a permanent injunction to restrain efendant municipal water company from ithdrawing and distributing water to its stomers. Defendant proposed to use as its source water a well which it had obtained by authority eminent domain proceedings. Plaintiffs alleged at such use adversely affected the wells of eighboring property owners. The court held that e use of waters from the defendant's well must be nited to purposes incidental to the beneficial enyment of the land from which they are obtained d if their diversion or sale to others away from e land impairs the supply of water on the propere of another, such is not a lawful purpose. The urt noted that the municipal nature of the defennt created no distinction in its favor, nor did the ct that the water used was to be furnished to the blic put the cause of the defendant in a more vorable position. Although judgment was ndered for the plaintiff injunctive relief was not anted. As an alternative remedy the court quired the defendant to supply free water service the plaintiffs in proportion to their individual sses. (Kuder-Fla)

lentifiers: High Plains, Texas.

he need of and techniques for artificial recharge areas where groundwater is mined are reviewed. the High Plains of Texas there is no developed rainage pattern; 2.5-3 million acre-ft of runoff per collects in playas where 90% of it is lost to vaporation. About 5 million acre-ft a yr of water is eing mined. Recharge would slow the lowering of ater levels, reduce flooding, and reduce the ealth hazard of standing waters. Recharge may be y recharge or multipurpose wells, shafts above the ater table, pits or trenches, rubble cones, and ater-spreading. The best method depends on uantity and quality of water and the physical naure of the aquifer and any overlying formations. uspended material may clog aquifers as may recipitable dissolved solids, particularly in wells nd pits. Clarification of water is often economially justified. Recharge with waste water is practical but may be aesthetically or psychologically isturbing to water users. Nitrates and phosphates ay be chemical problems in such waters when ey are recharged, but not if they are used for irgation. Recharge is a means of handling imported ater when demand is temporarily below supply. egal problems involving ownership of recharged ater must be solved. (Knapp-USGS)

ARTIFICIAL RECHARGE THROUGH AUGMENTED BANK STORAGE,
Princeton Univ., N. J., Civil Eng Dept.
Roger J. M. DeWiest.
Pap, Symp Artif Recharge and Manag of Aquifers, Haifa, Israel, Mar 1967. 28 p, 6 fig, 10 ref. OWRR Project A-011-NJ.

Descriptors: *Groundwater recharge, *Bank storage, Aquifers, Water table, Dams, Trenches, Wells, Hydraulic conductivity, Rivers, New Jersey.

Nonsteady flow is examined for a ground-water recharge project in which rainfall runoff is returned to a water table aquifer in the vicinity of Princeton, N. J. The recharge is accomplished by damming a river and its tributary and by reversing the hydraulic gradient between the river and its connected ground-water basin. Most of the natural recharge to the ground-water table in the area occurs during the rainy season from Nov to late May. With the resulting build-up of ground-water level, effluent discharge to the rivers increases. This increase ultimately is a net loss of fresh water to the ocean. This loss would be reduced significantly by construction of dams. Increased water level in rivers would automatically decrease the hydraulic gradient from ground-water reservoir to the rivers and hence limit the effluent discharge. Simultaneously, the groundwater reservoir would be pumped and this would make available more storage space for retention of a higher percentage of winter-spring rainfall or for quick recharge from flash summer runoff. A geohydrologic description of the watershed is given and various physical parameters entering the study are discussed.

RECONNAISSANCE STUDY OF THE PECOS RIVER BASIN, NEW MEXICO.
New Mexico State Univ, University Park.
John W. Hernandez.
Final Rep, Jan 1967. 4 p, 1 ref. OWRR Project B-003-NMex.

Descriptors: *Ground water, Water resources, River basins, Hydrology, Groundwater geology, Water development, Irrigation, *New Mexico, Mathematical models, Confined water, Systems analysis, Water pollution, River basin development.
Identifiers: Roswell (New Mexico), *Pecos River Basin (New Mexico).

The Pecos River Basin in New Mexico is typical of many in the western United States. The water supply is used almost exclusively for irrigation purposes, irrigation practices include conjunctive use of both surface and ground waters as well as the use of one or the other as a supply, and the ground water in storage is being progressively depleted. Objectives of the project were: (1) to inventory the available water resources, (2) to inventory water resources information and literature available for the Pecos River, N Mex, (3) to review the nature of water resources problems of the basin, and (4) to prepare a comprehensive research proposal designed to generate a decision-making, mathematical model to permit redevelopment of water resources of the basin. The principal water supply problems, particularly those of Roswell groundwater basin were investigated. Because of the geology of the Roswell area, the ground-water system in the area can be studied separately from the water supply of the remainder of the basin. A comprehensive project proposal to develop a model for the optimal utilization of the water supply of the Roswell Basin was prepared based on the information generated in this study.

QUALITY OF THE SHALLOW GROUND WATER IN THE RINCON AND MESILLA VALLEYS, NEW MEXICO AND TEXAS,
U S Geological Survey.
J. A. Basler, and L. J. Alary.
U S Geol Surv open-file rep, 30 p, Aug 1968. 4 fig, 2 tab, 6 ref.

Descriptors: *Water quality, *Observation wells, *Sampling, Conductivity, Texas, Pumping, Groundwater movement.
Identifiers: *Rincon and Mesilla Valleys, Specific conductance.

40 observation wells in the Rincon and Messila Valleys, in New Mexico and Texas, were sampled for chemical analysis. These wells were bailed and pumped when capable of sufficient yields, until the field specific conductance of the water from the well had stabilized. Since complex and varying environmental factors, such as drains, canals, and laterals influence the quality of the shallow groundwater in these valleys, the quality cannot be attributed to a single source. Chemical analyses indicate that the quality of the water in the valleys deteriorates with movement downstream, and also deteriorates laterally away from the river. In most places the shallow groundwater is unfit for domestic use but is acceptable for irrigation use. Periodic water-level measurements are made in the wells to observe the general effect of pumping and of surface-water irrigation practices on the shallow water table in the valleys. A figure explains the classification for irrigation use of the shallow groundwater in the area concerned; a map shows the concentrations of selected chemical constituents in the shallow groundwater and the specific conductance of the water at selected sites. MEMORANDUM REPORT ON TEST DRILLING AT NORFOLK VIRGINIA,
U S Geol Surv, WRD, Richmond, Virginia.
Donald L. Brown.
U S Geol Surv open-file rep, 28 p, 1968. 2 tab, 1 map.

Descriptors: *Recharge wells, *Underground storage, *Testing, *Aquifers, Observation wells, Water chemistry, Water supply, Municipal water, Hydrologic data, Logging (Recording).
Identifiers: Norfolk (Virginia).

A test well was drilled near Norfolk, Va to explore the feasibility of the storage and retrieval of fresh water after injection into an aquifer containing saline water. The test hole was drilled to a depth of 2,587 ft in unconsolidated sediments. No fresh water was found below 100 ft. A sand suitable geologically and hydrologically for injection was found between 900 and 1,000 ft. It is confined between clay beds and is thick enough to hold enough water to supply Norfolk for a considerable time. The water to be injected and the formation water are probably compatible. The water in the formation contains about 1,000 ppm chloride. A lithologic log of the well is included. Chemical analyses of water smaples from various depths in the test hole are tabulated. The location of the well is shown on a map, scale 1:24,000. (Knapp-USGS)

Descriptors: Water law, Drainage, Drainage water, Drainage control, *Surface runoff, *Surface drainage, Judicial decisions, *Ohio, *Controlled drainage, Drainage systems, Civil law, Drainage effects.

A lower landowner sought equitable relief to require the county to control discharge of surface and stream waters which flowed from higher county land onto the premises of the plaintiff. In constructing an airport the defendant had increased the natural flow of surface waters onto the land of the plaintiff, causing inconvenience and damage. Instead of pursuing his right to injunctive relief, the plaintiff sought to retaliate by constructing a dam and overflow pipe. As a result, large quantities of drainage water were discharged from plaintiff's premises into a ditch adjoining a county road, causing damage to both the ditch and the road. Reciprocal relief was sought by the defendant to enjoin the plaintiff from further damaging its road. In applying the civil rule, the court held that the plaintiff was required to receive only that part of the surface water which naturally passed over his land from the airport. The defendant was therefore held liable for accelerating and diverting surface water over the land of the plaintiff which had no natural outlet on his premises. On the same theory the plaintiff was held liable for damages sustained by the road and ditch. The court apportioned between the plaintiff and defendant the estimated cost necessary to correct and control the drainage situation. (Kuder-Fla)

Landowners brought an action against defendant contractor for the alleged negligent construction of drainage facilities. While conducting blasting operations in conjunction with a state highway project, defendant constructed facilities to drain diffuse surface water from the construction area. Plaintiff alleged that the drainage facilities were negligently constructed and inadequate to accommodate the volume of water that might reasonably be expected to accumulate in the area. Consequently large quantities of mud had accumulated, damaging the land of the plaintiff and contaminating his water supply. Judgment for the plaintiff was appealed on the ground of insufficient evidence. The court held that the evidence was sufficient to establish the liability of the defendant. (Kuder-Fla)

Descriptors: *Georgia, Judicial decisions, *Surface runoff, Soil erosion, Depreciation, *Damages, *Contours (Flow control), Architecture (Design), Ponding, Drainage systems, Overflow, Abatement (Flood control).
Identifiers: *Injunctions.

Plaintiff sought an injunction and damages against architects, church and contractor. The plaintiff alleged that the defendants, by altering the contours of the church property in building a new church, had caused water in unnaturally high amounts to run upon and damage the plaintiff's property. The court granted a temporary injunction against all defendants so they could attempt to correct the damaging condition. The architects appealed. This court held the architects could be held for damages for negligent performance of their profession in allowing the faulty design to be put into effect. The ruling was reversed as far as it named the architects as co-respondents to the injunction. Since the architects had completed their portion of the contract and turning the property over to the church some months prior to the plaintiff's suit, they could not have legally disturbed the church's exclusive possession of the land to correct the condition created by their faulty methods. This being so they could not be enjoined at a later date against subsequent injury to the plaintiff's property. (Blunt-Fla)

HOLLEY V STATE (OBSTRUCTION OF DRAINAGE).

128 So 2d 908-911 (Ct App La 1961).

Descriptors: *Floods, *Flood damage, *Drainage, Surface drainage, *Louisiana, Legal aspects.

The plaintiff claimed the highway department's negligent construction of a highway caused an obstruction to natural drainage resulting in the inundation of the plaintiff's property. The court held it incumbent upon the plaintiff to establish by strong, clear and convincing proof that the alleged damages were caused by the defendant's installation of inadequate drainage structures along the highway. The court considered the evidence and decided that the flooding was not due to the insufficiency of openings in the highway. (Horner-Fla)

HARRISON COUNTY V GUICE (OWNERSHIP OF ARTIFICIAL BEACH).

140 So 2d 838-843 (Miss 1962).

Descriptors: Mississippi, Judicial decisions, *Easements, Highwater mark, Right-of-way, Highways, Beaches, *Sea walls, Shore protection, *Accretion (Legal aspects), Riparian rights.
Identifiers: *Littoral rights, Upland owner, Counties.

It was held that where a county acquired an easement for construction of a seawall for protection of a highway and an easement to replace, repair and maintain the seawall and highway, the easement was so limited and no other estate in the lands was acquired. The county condemned a 50-foot strip of land for a right-of-way for construction of a seawall for protection of a highway and such wall was constructed in 1927. In 1951 the county constructed a sloping beach for further protection of the seawall. Since this was not within the easement, the upland owner acquired the beach to the highwater mark in fee simple. GROMMES V TOWN OF AURORA (SURFACE DRAINAGE).

37 111 App 2d 1; 185 N E 2d 3-9 (1962).

Descriptors: Surface runoff, Drainage, *Culverts, Rain water, Surface water, Flooding, Drainage water, Damages, *Illinois, Surface drainage, *Roads, Road construction, Road design, Cultivated lands, Flood damage, Farms, Crops.

Plaintiffs sued defendants for damages resulting from a highway improvement which plaintiffs alleged interferred with the drainage of their farms. A jury returned a verdict for the plaintiffs and defendants appealed. The evidence discloses that the normal drainage of the lands in question was westward from Grommes Farm, then southward across the tract farmed by Schoger, over or under the township road and then southerly to Blackberry Creek. Before the road was resurfaced, plaintiff had never lost a crop due to flooding. The court affirmed the decision on the basis that a municipal corporation in the management of its property is held to the same responsibility that attaches to individuals for injury to the property of others. MUNN V HORVITZ CO (INJUNCTION AGAINST STORM SEWER MAINTENANCE).
184 N E 2d 231-239 (Ohio 1962).

Descriptors: *Judicial decisions, *Ohio, Cities, *Prescriptive rights, Surface runoff, Surface drainage, Storm runoff, *Storm drains, Conduits, Conveyance structures, Drainage systems.
Identifiers: Injunctions.

Plaintiff brought suit to enjoin the completion of a project to enlarge a storm sewer emptying into a creek which ran past plaintiff's property. The sewer system had been originally constructed in 1925 by county authorities. Since that time, the area draining into the sewer had greatly changed in character from rural to residential and commercial, with streets, shopping centers and parking lots. The court heard much detailed and technical evidence. The court held that the county and city had gained a prescriptive right to continue to use the sewer together with the right to make improvements thereto necessitated by development of the drainage area by private individuals and by the construction of public improvements. The use of the

ewer had been continuous, open and notorious for ver 37 years. The court also pointed out that laintiff had an adequate remedy at law for any amages sustained from wrongful acts by defen- ants, and that therefore injunctive relief was not arranted. (R. F. Williams-Fla)

BARDWELL V MANISCALCO (DAM CAUSING WATER ENCROACHMENT).
135 So 2d 84-87 (Ct App La 1961).

Descriptors: *Louisiana, *Dams, *Backwater, Dam construction, Judicial decisions, Encroachment.
Identifiers: Damages (Legal aspects).

Plaintiff brought suit against defendant adjoining landowner for alleged damages resulting from a dam constructed by defendant which partially en- croached on plaintiff's land. Natural drainage had been from plaintiff's to defendant's land, into a natural pond partially on the land of both. Plaintiff consented to defendant's proposed construction of the dam as long as it did not encroach on his land. However, the dam was much larger than plaintiff claimed they agreed upon and both encroached on plaintiff's land and caused water to back up on his land. Defendant answered that plaintiff saw all of the construction as it progressed and did not com- plain, thereby manifesting his implied consent. The trial court found for plaintiff, but awarded only nominal damages. The appeal was concerned only with the question of damages. (R. F. Williams-Fla)

KLUTEY V COMMONWEALTH DEP'T OF HIGHWAYS (EFFECT ON WATER OF HIGHWAY CONSTRUCTION).

428 S W 2d 766-772 (Ct App Ky 1968).

Descriptors: *Diversion structures, *Drainage waters, *Civil law, Kentucky, Natural flow doc- trine, Judicial decisions, *Riddance (Legal aspects), Drainage programs, Drainage effects, Comparative benefits, Repulsion (Legal aspects).

This was an action for injunction by the state. Ap- pellant counterclaimed for injunction against the state, claiming that two drainage culverts, con- structed under a new highway, accelerated the flow of water onto their lands, cutting deep ditches and creating a flooding condition. Assuming the state to be in the position of an adjoining land owner, and departing from the civil law rule that the upland owner could not erect artificial structures altering the water flow to the lower estate, the court held that the appellants (lower land owners) could prevail only if the state (upper land owner) un- reasonably changed that natural flow, causing un- natural volumes or unusually swift flows on the lower land. The test was balancing the reasonable- ness of use by the upper owner against the severity of damage to the servient owner. In determining the right of the lower owner to recover, four con- siderations were proposed: (1) necessity of drainage; (2) care taken to avoid unnecessary damage to lower land; (3) benefit to the land drained vis-a-vis detriment to lower land; (4) im- provement of natural drainage or adoption of a reasonable artificial system. One judge dissented. (Storace-Fla)

The appeal is from a judgment refusing to grant the appellants injunctive relief and damages against the appellees. The tract of land being developed as a subdivision by the appellees lies on the west wide of Ormsby Lane. The land owned by appellants is located on the east side of Ormsby Lane. The natu- ral drainage from the appellee's tract is across the appellants property and into Big Goose Creek. In developing the subdivision appellees caused a shal- low artificial pond to be eliminated. The court stated that the rule in Kentucky permits the owner of an upper estate to drain and ditch his land for the purpose of carrying off surface water into natural channels by building sewers, gutters and culverts thereon, without liability to the owner of the lower estate, even though such methods of ridding his property of surface water accelerate and increase the flow of water onto the lower estate, so long as he does not divert water from natural drains which otherwise would not have flowed onto the lower estate. On the basis of the above rule the court af- firmed the order. (R. Smith-Fla)

GROSSMAN V JENAD, INC (FLOODING BY ARTIFICIAL CHANNELS).
198 NYS 2d 218-230 (Sup Ct 1960).

Descriptors: *New York, Damages, Flooding, *Ar- tificial watercourses, Flow, Dams, Drainage systems, Judicial decisions, Water law, Civil law, Culverts, Developed waters, Sluices, *Alteration of flow, Streamflow, *Natural flow doctrine, Over- flow, Diversion structures.

A man-made pond on defendant's property, con- structed for the purpose of collecting water from the surrounding terrain, opened by means of a concrete headwall and sluice gate constructed by defendant into a stream that ran across plaintiff's property. Defendant, a land developer, constructed additional artificial channels and pipes which diverted certain surface waters into the stream. Plaintiff sustained damages caused by the greater force and volume resulting from this unnatural in- creased flow of water. The stream had formerly been clear and gentle; after the artificial channels and pipes were constructed, the water carried dirt and debris, the banks became eroded and the rip- rapping became undermined. The court stated that any natural or normal alteration of one's land through reasonable improvements which results in casting surface waters upon the land of another creates no liability unless such surface waters are so collected in drains, pipes, or ditches and cast onto another's premises. Holding that the damages were caused by the artificial channels rather than from heavy rains alone, the court found for the plaintiff in the amount necessary to alter his property to carry off the additional volume of water caused by defendant's installation of the artificial channels. (S. Scott-Fla)

MUEHLHAUSEN V DELAWARE VALLEY HOLDING CO (NEGLIGENT WATERCOURSE RELOCATION).
9 Bucks Co L Rep.

Descriptors: Civil law, Judicial decisions, Legal aspects, Ownership of beds, Relocation, Social needs, Water law, Watercourses, Diversion, Reasonable use, Relative rights, Streamflow, Allu- vium, Erosion, *Relocation, *Pennsylvania, Land- scaping, Sedimentation, Silting, Riparian rights, *Damages.

A rock-bottomed, fast-running stream ran through plaintiffs' wooded property. Plaintiffs widened and deepened the watercourse and constructed small dams and spillways, creating small pools and a con- trolled flow of clear and wholesome water with lit- tle or no sediment or alluvial matter. The water- course in question ran across defendant's land in an irregular course and directly onto plaintiffs' pro- perty. Defendant relocated the channel, but took no precautions to prevent wash or erosion of the new channel, even though the old channel's bed and banks were rock, while those of the new chan- nel were largely dirt. As a consequence, large

LIBRARY U. OF I. URBANA - CHAMPAIGN

amounts of silt and other eroded matter were deposited within the streambed on plaintiffs' property, filling all its pools. The court held that the defendant had been negligent in relocating the watercourse, and was liable to plaintiffs for the costs of removing the deposits from plaintiffs' land. It is incumbent upon one changing the natural channel of a watercourse to exercise due care in providing and maintaining the substituted channel. (S. Scott-Fla)

JEFFERY V LATHRUP (RELOCATION OF TILE DRAIN).
363 Mich 15, 108 NW 2d 827-831 (1961).

Descriptors: *Michigan, Civil law, Judicial decisions, *Easements, Drainage, Controlled drainage, Tile drainage, Tiles, Surface runoff, Tile drains, *Relocation, Damages, Septic tanks, Saturation, Market value.

Plaintiff purchased a home from defendant, a real-estate developer. At the time of the purchase, the plat for the subdivision showed a 20 foot easement for drainage running over the rear of plaintiff's property and diagonally across the adjacent lot owned by defendant. There was an 8 inch tile line in this easement. Plaintiff had no drainage problems for three years, until defendant relocated the tile drain in preparation for construction of a house squarely across the easement for drainage shown on the plat. As a result, plaintiff suffered damages consisting of saturation and back pressure in his septic tank, causing the toilets and drains in his house to malfunction, and the basement to flood through a floor drain. The court held that under such circumstances defendant would be liable for either present or future damages, or for an amount representing permanent impairment of the value of plaintiff's property. GOLOSKIE V LA LANCETTE (RIPARIAN RIGHTS IN ARTIFICIAL POND).
163 A 2d 325-330 (RI 1960).

Descriptors: *Rhode Island, Judicial decisions, Dams, Riparian rights, Navigable waters, Ownership of beds, Relative rights, Riparian land, Riparian waters, *Farm ponds, Multiple-purpose reservoirs, Ponds, Recreation, Artificial watercourses.

The complainant created an artificial pond on his property by damming up a small brook. He is seeking to enjoin the respondent, who claims a right as a riparian owner to fish and swim in the pond, from trespassing on the pond. In order to have the riparian rights claimed by respondent, it must be shown by evidence that the pond is fed by a navigable river. No such evidence was presented in this case. The fact of flowage from the pond will not bring the shores of the pond to the property bordering such pond. The respondent is not entitled to the riparian rights he claims. (Headley-Fla)

ALLIANCE FOR CONSERVATION OF NATURAL RESOURCES IN PINELLAS COUNTY V FUREN (REVIEW OF ORDER OF COUNTY WATER AND NAVIGATION AUTHORITY ALLOWING FILLING OF SUBMERGED LANDS).
122 So 2d 51-67 (Fla DCA 1960).

Descriptors: Judicial decisions, *Florida, *Beds, Navigable waters, *Landfills, Legislation, Islands, Overflow, Sand bars, Swamps, Standards, Transportation, Recreation, Channels, Erosion control.

The Pinellas County Water and Navigation Control Authority is authorized to regulate and exercise control over the dredging and filling of all submerged bottom lands in the county, together with all islands, sandbars, swamp and overflow lands. The act which created the authority sets up 8 standards which must be met before the authority can grant permission to fill submerged lands. These standards deal with the effect of the proposed plan on such things as transportation, recreation, erosion control, the flow of water, natural beauty, wild life, and other natural resources. If the petition meets these standards then the authority has no alternative but to grant permission. The court determined that the evidence presented at the original hearing supported the granting of permission and the decision of the lower court was affirmed. (R. H. Watson-Fla)

CH 215 - AN ACT RELATING TO EXCAVATING, FILLING AND DREDGING IN AND ADJACENT TO TIDAL WATERS.
Laws of New Hampshire 1967, ch 215, 2 p.

Descriptors: *Legislation, *New Hampshire, Water pollution, Administrative agencies, Landfills, *Dredging, Mining, Excavation, *Tidal waters, Banks, Marshes, Swamps, Aquatic habitats, Bulkheads, Runoff, Shellfish, Marine fisheries, Wildlife.
Identifiers: Equity.

New Hampshire requires that any person who intends to excavate, remove, fill or dredge any bank, flat, marsh, or swamp in and adjacent to tidal waters submit plans of such proposal to the New Hampshire Port Authority at least 30 days prior to the beginning of the work. The Port Authority will hold a public hearing on the proposed project. After the hearing the authority may deny the petition, or may require the installation of bulkheads or other containment structures to prevent subsequent fill runoff back into tidal waters. If the area on which the proposed work is to be done contains shellfish or marine fisheries and wildlife, the director of the N H fish and game department may impose such conditions as he deems necessary for their protection. Any person who violates this statute may be liable for removal of all fill and subject to a maximum fine of $1,000. (R. H. Watson-Fla)
W69-00904

AN ACT RELATIVE TO EXCAVATING AND DREDGING IN PUBLIC WATERS.

Laws of New Hampshire 1967, Ch 274.

Descriptors: *New Hampshire, Legislation, State jurisdiction, Administrative agencies, Administrative decisions, Adjudication procedure, Public rights, High water mark, *Beds under water, *Dredging, *Permits.
Identifiers: Public waters.

A new chapter, 488-A, is added. It provides that no one shall excavate, dredge, or remove any bank, flat, marsh, swamp or lake bed lying below the natural mean high water mark of any public waters, except as therein provided. Natural ponds of more than ten acres are declared to be public waters. An owner of a shore line on public waters may petition the governor and council for permission to dredge in front of his property. The governor and council may grant such permission, upon recommendation of the water resources board and payment of just compensation. Hearings by the water resources board are provided for. A penalty for noncompliance is provided for. The petitioner must pay the costs of the hearings. (R. F. Williams-Fla)
W69-00905

CH 307 - AN ACT RELATIVE TO PLACING FILL IN PUBLIC WATERS.

Laws of New Hampshire 1967, Ch 307, 3 p.

Descriptors: *Legislation, *New Hampshire, *Landfills, Administrative agencies, Water resources development, Ponds, High water mark, Federal government, Piers, Beds.
Identifiers: Public waters.

New Hampshire generally prohibits placing fill i public waters. Public waters include all natura ponds of more than ten acres and all rivers an streams. This prohibition does not apply to th state, federal, or local governments. The governo and council, upon petition and upon recommenda tion of the water resources board, may, for jus consideration, grant to an owner of shoreline o public waters, the right to place fill in the bed o such waters in front of his shoreline. The statut outlines the procedure for obtaining permission t fill. It includes a hearing and publication of th hearing. All costs of the hearing are to be paid b the person soliciting permission. If a person place fill in public waters without permission he is subje to a fine not to exceed $1,000 and may be con pelled to remove the fill by the superior court. (R H. Watson-Fla)

4D. Watershed Protection

LOCAL ACTION AND ACCEPTANCE O WATERSHED DEVELOPMENT,
Mississippi State Univ., State College.
Kenneth P. Wilkinson.
Water Resour Res Inst Rep, 1966. 43 p, 7 tab, 3 ref, append. OWRR Project A-008-Miss.

Descriptors: *Watersheds, *Public opinion, Soci values, Participating funds, Land ownershi *Questionnaires, *Flood control, *Soil erosio *Watershed management, Social aspects, Soci participation.

This is an exploratory study of effects of commun ty structure on projects of watershed developmer Case studies were conducted in 2 communities which community structure had been examined previous research. In one community, where acti in other areas of interest had been carried primarily in special-interest fields, actors in t watershed program were successful in programm efforts to secure local resources. In the seco community generalized community leaders we involved primarily in initiation of the watersh project. A higher level of physical accomplishme was reached in the project in the former and titudes of rural landowners toward watersh development were more favorable. Findings su gest that technical, special-interest projects, su as watershed development, operate more smooth where community structure is less integrate Research concerned with a large number of co munities and a variety of watershed projects needed to specify the optimal level of contact a the conditions under which that level is proached.

AN ACT TO ENTER INTO THE CHAMPLAIN BASIN COMPACT, ESTABLISH A COMMISSION TO REPRESENT VERMONT AND REPEAL 10 V S A SECS 172-184.

Laws of Vermont 1967, No 93. 14 p.

Descriptors: *Vermont, *Legislation, New York, Administrative agencies, *Interstate compacts, *Watersheds (Basins), Grants, Budgeting, Financing, Watershed management, Water resources development, Water conservation.
Identifiers: Champlain Basin Compact.

The legislatures of New York and Vermont, having recognized the need for a regional inter-governmental forum for consideration of the problems and coordination of governmental activities in the Champlain Basin, drafted the Champlain Basin Compact. This statute adopts the compact by Vermont, and contains a copy of the compact. New York and Vermont are the original members of the compact, but it also provides for membership of Canada if adopted. The compact provides for general watershed management. The Champlain Basin is defined. Details of the compact are given including finance, development plans, and creation of Lake Champlain Park. (R. H. Watson-Fla)

WATER MANAGEMENT ON SEMIARID WATERSHEDS,
Dept. of Agriculture, Tucson, Agricultural Research Service.
R. B. Hickok.
17th Annu Ariz Watershed Symp Proc, 1967, pp 9-14. 6 p, 12 fig.

Descriptors: Arizona, *Water management (Applied), *Watershed management, *Semiarid climates, Flash floods, *Sediment discharge, Watersheds (Divides), Economic impact, Erosion control, *Rainfall-runoff relationships, Water utilization, Water yield improvement.
Identifiers: *Walnut Gulch Experimental Watershed (Arizona), Experimental watersheds.

Research conducted on the 58-square-mile Walnut Gulch Experimental Watershed at Tombstone, Arizona, was used to determine optimum utilization of available water, whether on or off the watershed, and control of flash flood and sediment damage. Basic hydrologic processes involved were studied, including their interrelationships and their reaction to various watershed conditions. This basic information was used for predicting and improving behavior of other semiarid rangeland watersheds throughout the Southwest. (Blecker-Ariz)

USDA REPORT ON WATER AND RELATED LAND RESOURCES, POWDER DRAINAGE BASIN, OREGON.
U. S. Department of Agriculture, and Oregon State Water Resources Board, Salem.

U. S. Dep of Agr, Econ Res Serv, 132 p, Jan 1966. 13 fig, 8 map, 33 photo, 26 tab.

Descriptors: *Watersheds (Basins), *Land resources, *Watershed management, *Oregon, Range management, Forest management, Agricultural watersheds.
Identifiers: Flood prevention.

Erosion, flooding, drainage and other water-related problems of the Powder Drainage Basin, Oregon, were assessed in relation to future requirements for water and land resources. Previously recorded data were collected and evaluated; in addition, the USDA River Basin Survey Staff made limited studies to gather basic data not otherwise available, such as physical characteristics of certain reservoir sites, land and water availability and use, needs for tributary watersheds, and forest land resources and ownership. Watershed protection is discussed in relation to agriculture, rangeland, and forestry. Agricultural use of both groundwater and surface water is emphasized. Pertinent tabular data are provided as background information for future work envisaged. (Llaverias-USGS)

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification OF Pollutants

RADIOACTIVITY IN WASHINGTON SURFACE WATER, JULY 1966-JUNE 1967.
Washington State Department of Health, Seattle.

Radiol Health Data and Rep, Vol 9, No 8, pp 438-442, Aug 1968. 5 p, 1 fig, 4 tab, 6 ref.

Descriptors: *Data collections, *Radioactivity, *Monitoring, *Surface waters, Water quality, Radiochemical analysis, Washington, Analytical techniques.

Data from radioanalysis of surface water samples collected in the State of Washington are tabulated. Of the 175 river water samples analyzed in 1966-67, excluding the Columbia River, the total beta radioactivity ranged from 1-26 pCi/liter and averaged 3.0. Radioactivity of the suspended fraction ranged from less than 1 to 17 pCi/liter and averaged less than 1. Radioactivity of the soluble fraction ranged from less than 1 to 10 pCi/liter and averaged 1.8. Average beta radioactivity of the Columbia below Hanford ranged from 5 to 308 pCi/liter. Phosphorus-32 concentration ranged from less than 1 to 360 pCi/liter. Gamma emitters ranged from less than 50 to 127 pCi/liter for ruthenium-106, less than 5 to less than 20 for zirconium-95, less than 100 to 8,458 for chromium-51, and less than 20 to 466 for zinc-65. (Knapp-USGS)
W69-00916

INSECTICIDE ADSORPTION BY LAKE SEDIMENTS AS A FACTOR CONTROLLING INSECTICIDE ACCUMULATION IN LAKES,
Wisconsin University, Madison, Soils Dept.
G. Chesters.
Rep of Phase 2 of project. Rep of Office of Water Resources Res, Wis Univ, Madison. 14 p, 4 tab, 4 fig, 2 attach. August 1968, OWRR Project B-016-Wis.

Descriptors: *Insecticides, *Adsorption, *Lakes, *Sediments, Clays, Organic matter, Chemical degradation, Hydrolysis, Pesticide kinetics, Methodology.
Identifiers: Malathion, Parathion, Lindane.

Investigation of the adsorption of insecticides on lake sediments as a factor controlling insecticide accumulation in lakes is reported. Reprints of 2 Journal papers are attached to and form a part of this report; one describes a quantitative method for unified extraction of organochlorine and organophosphate insecticides from lake waters and the other reports on determination of lindane adsorption on 8 intact lake sediments using a radiochemical technique. Methods developed for extraction and analysis of insecticides ranged in effectiveness from 81-88% for heptachlor to 93.9-102.4% for most other commonly used insecticides. Lindane adsorption was affected by suspended sediment concentration, organic content, lindane concentration and clay content. Adsorption is decreased in the presence of iron oxides, possibly because oxide coatings on clay particles interfere with surface OH bonding. Adsorption in separate sediment fractions decreases with increasing particle size. Malathion adsorption is largely controlled by organic content of sediment. In separate sediment fractions, however, malathion adsorption decreased with increasing particle size and iron oxide content. Lindane degradation is faster under anaerobic than aerobic conditions. Parathion decomposes by hydrolysis in a first-order reaction with a half-life of about 50 hours. (Lang-USGS)
W69-00921

GROSS RADIOACTIVITY IN SURFACE WATERS OF THE UNITED STATES, FEBRUARY 1968.
Division of Pollution Surveillance, Federal Water Pollution Control Administration, Washington, D. C.

Radiol Health Data and Rep, Vol 9, No 8, pp 436-437, Aug 1968. 2 p, 1 fig, 1 tab, 7 ref.

Descriptors: *Data collections, *Radioactivity, *Monitoring, *Surface waters, Water quality, Radiochemical analysis.

The data obtained in the monitoring of levels of radioactivity in surface waters of the U S in Feb 1968 are tabulated. The radioactivity of dissolved solids alone roughly indicates levels in treated water because nearly all suspended matter is removed in treatment. Strontium-90 results are reported semi-annually. Special note is made when alpha radioactivity concentration is 15 pCi/liter or more and when beta radioactivity concentration is 150 pCi/liter or more. In Feb 1968, the Arkansas River at Coolidge, Kansas, the North Platte at Henry, Nebraska, and the South Platte at Julesburg, Colorado exceeded 15 pCi in alpha radioactivity concentration. (Knapp-USGS)
W69-00933

THE ANALYSIS OF AROMATIC COMPOUNDS IN WATER USING FLUORESCENCE AND PHOSPHORESCENCE.
New Hampshire Univ, Durham.
David W. Ellis.
Prog Rep, Phase I, 1968. 24 p, 1 fig, 1 tab, 21 ref.
OWRR Project A-009-NH.

Descriptors: *Aromatic compounds, *Water analysis, Chemical analysis, Gas chromatography, Spectrophotometry, *Spectrometers, Fluorescence, *Fluorometry, Temperature, Instrumentation, Aromatic solvents, Chromatography.

The paper is a progress report covering the first phase of an investigation using a commercial spectrofluorometer/spectrophosphorim eter for analyzing aromatic compounds in water. The object of the investigation is to develop a basic method for analysis of aromatic compounds. Pesticide analysis Grade n-pentane was selected as the solvent for extraction. The report covers: Extraction and concentration, column chromatographic removal of basic components, thin-layer chromatographic separation and identification, fluorescence analysis, gas chromatographic analysis, mass spectrometer, and nitromethane extraction. Planned research for the remainder of the first phase is given.

VIRUS INACTIVATION ON CLAY PARTICLES IN NATURAL WATERS,
Metcalf and Eddy, Boston, Mass, and Maine Univ., Orono.
George F. Carlson, Jr., Franklin E. Woodard, and David F. Wentworth.
Supported in part by U S Dept of the Int, WRA 1964 and FWPCA Grad Tr Grant and Res Grant. J Water Pollut Contr Federation, Vol 40, No 2, Part 2, pp R89-R106, Feb 1968. 18 p, 9 fig, 10 tab, 19 ref. OWRR Project A-004-ME.

Descriptors: *Water pollution, *Viruses, Aquatic microbiology, Clays, Suspension, Turbidity.
Identifiers: *Virus inactivation, Adsorption virus.

Research was conducted on the inactivation of viruses in clay particles suspensions as affected by various conditions found in natural streams. Of special interest were the primary inactivation mechanism, the effect of varying ionic strength with different clays, and the effect of organic macromolecular substances on inactivation. Viruses used in research were: bacteriophage T2, against Escherichia coli strain B, and type 1 poliovirus. The poliovirus was titered by the plaque technique. All clay particles were centrifuged from the observed virus inactivation. To evaluate the applicability of these basic research results to the natural situation, natural river turbidity collected from the Missouri River was resuspended in tapwater and experiments were conducted with varying amounts of calcium chloride. The effects of centrifugation to remove clay particles are discussed. Among the many experimental findings listed, it is stated that the adsorption of virus only clay particles was proven to be reversible; thus, viruses absorbed onto clay are inactivated only temporarily. (Llaverias-USGS)

5B. Sources of Pollution

THE MOVEMENT OF RADIONUCLIDES THROUGH SOIL FORMATIONS,
Iowa State Univ., Ames.
Charles A. Qulman, and Lyle V. A. Sendlein.
Eng Res Inst Rept, Jan 1968. 27 p, 12 fig, 1 map. OWRR Project A-011-Ia.

Descriptors: Geologic mapping, *Radioisotopes, Soil physical properties, *Tracers, Subsurface investigations, *Radioactive wastes, Radioactive waste disposal, Geologic investigations, Foundations, Permeability, Seepage, Adsorption.

A study was made on the site of the Ames Laboratory Research Reactor to gather basic information needed in planning future field studies concerned with the movement of radionuclides through soil. Soil and bed rock in the area were mapped by outcrop studies and by electroresistivity and seismic measurements. Six bore holes were drilled to provide control for indirect geophysical measurements. The physical properties of soils from the B-horizon and from a gully used for waste water disposal were investigated. Tracer studies were made on disturbed and undisturbed soil samples in the laboratory by percolating spiked solutions through soil columns to determine the uptake of strontium and cesium. Batch tests were also made to develop the adsorption isotherms of the soil for strontium and cesium.

VIRUS INACTIVATION IN NATURAL WATERS. 1. VIRUS INACTIVATION ON CLAY PARTICLES,
Maine Univ., Orono.
G. F. Carlson, Jr., F. E. Woodard, and O. J. Sproul.

39th Annu Conf, Water Pollut Contr Fed, Kansas City, Mo, Sept 1966. 47 p, 9 fig, 10 tab, 19 ref. OWRR Project A-004-Me.

Descriptors: *Viruses, Microorganisms, *Bacteriophage, Biocontrol, Diseases, Microbiology, Water pollution sources, Public health, Clay.

The objective of this research was to investigate the adsorption of virus to several different types of clays. The experimental virus used was T2 Bacteriophage and the Type I Poliovirus. The maximum removal obtained using a sodium salt-clay-virus system was 99% for each of the 3 clays studied. When the clay concentration was increased, the required salt concentrations to achieve maximum removal increased correspondingly. Competition for the adsorption site by other organics was demonstrated. It was determined that naturally occurring river clays (Missouri River) showed response very similar to those of the pure clay minerals.

THE ION-EXCHANGE REACTIONS OF RADIOACTIVE IONS WITH SOILS AND EFFECTS OF ORGANIC COMPOUNDS,
Illinois Univ., Urbana.
Bong Taick Kown.
Dep Civ Eng Rept, Oct 1966. 150 p, 45 fig, 14 tab, 43 ref, append.

Descriptors: Ions, *Ion exchange, *Soils, Montmorillonite, Illite, Clay minerals, Adsorption, Organic compounds, *Cation exchange, Radioactive wastes, Radioactive waste disposal, *Radioisotopes, Radioactivity, Organic matter.

The ion-exchange reactions of radionuclides with soil minerals and the effects of various water soluble organic compounds on the reactions were investigated. Theories were examined for predicting equilibrium distribution of radionuclides in soils. Results show the mass-action law describes ion-exchange equilibria except in systems involving hydrogen ions. Certain organic compounds are irreversably adsorbed on soil particles which reduces effective exchange capacity and the selectivity of the exchange media.

EFFECTS OF SOLUBLE ORGANICS ON FLOW THROUGH THIN CRACKS OF BASALTIC LAVA,
Hawaii Univ., Manoa.
Kenneth Ishizaki, Nathan C. Burbank, Jr., and Stephen Lau.
Tech Rep 16, Water Resour Res Center, Aug 1967. 56 p, 38 fig, 9 tab, 42 ref, 2 append. OWRR Project A-001-Hi.

Descriptors: Percolation, Ground water, *Permeability, Porosity, Closed conduit flow, *Ground water movement, Capillary flow, *Lava, Basalts, Water pollution sources, Microorganisms, Ferrobacillus, Flow resistance, Retention, Hawaii.
Identifiers: Hagan-Poiseuille flow, Clogging.

Most of Oahu's domestic water supply is from ground water occurring in permeable materials of volcanic rock. Movement of ground water is intrinsically through thin cracks in basaltic lavas. This project studied passage of an organic-rich liquid through cracks in basalt. Permeability of blue rock portions of a basalt was determined as 2.6 by 10 to the minus 4 power gal/day/sq ft of water, classing the rock as impervious. A range of 7.7 to 10.4% in porosity values was obtained from the blue rock portions; the clinker portion yielded a value of 50%. The greatest retardation in flow of nonbiodegradable liquids through thin cracks occurred in the initial hours followed by a systematic reduction of flow to 7/8 to 1/100 of the initial flow rate. Flow of organic-rich liquids through such cracks, similar to nonbiodegradable liquids, exhibits a decrease in flow initially and continues this trend for as long as 220 hr. Terminal flow velocity of tap water is much greater than that of sewage which appears to proceed to a no-flow condition. The clogging phenomenon was dependent upon microbial activity and food supply in sewage. The products are primarily polysaccharides and slimes along with ferrous sulfide, commonly found in septic sewage in contact with soil or rock.

WATER QUALITY AS AFFECTED BY A WYOMING MOUNTAIN BOG,
Forest Service, Rocky Mountain Forest and Range Exper Station, Laramie, Wyo.
David L. Sturges.
Water Resources Res, Vol 3, No 4, pp 1085-1089, 1967. 5 p, 1 fig, 3 tab, 7 ref.

Descriptors: *Water quality, *Bogs, *Peat, Wyoming, Iron, Coliforms, Solutes, Silica.

Waters collected July through Oct 1965 at a Wyoming mountain bog were analyzed for potability and seasonal changes in calcium, magnesium, potassium, iron, and silica. Four locations were sampled: effluent stream, fissure locations in the bog, peat locations in the bog, and groundwater. The color and turbidity of peat water greatly exceeded that at other locations and the maximum levels established by the U S Public Health Service for drinking water. The dissolved mineral content of all waters was very low, and the waters were of excellent chemical quality. All waters contained coliform organisms, probably of a nonfecal origin in peat and fissure water. The concentration of minerals in peat water remained constant through the sampling period. Mineral concentrations in groundwater increased in Sept, when the water table was at a seasonal minimum, but decreased in Oct following water table recharge. Silica levels were higher than other ions at all locations; the highest levels were in peat water. (Author)

THE QUALITY OF CONNECTICUT'S SURFACE WATERS.
U S Geological Survey, Hartford, Conn.
Chester E. Thomas, Jr.
Conn Univ Inst of Water Resources Rep 6, 11 p, July 1968. 1 fig.

Descriptors: *Water quality, *Surface waters, *Connecticut, Water pollution.

Identifiers: Connecticut River, Thames River (Connecticut), Housatonic River (Connecticut).

Information on the quality of water in Connecticut streams is summarized in a lecture presented at the University of Connecticut on October 18, 1967. The chemical quality of most surface waters in the State is good. The dissolved-solids concentration generally ranges from less than 100 to about 200 ppm during low streamflow periods. Waters draining areas underlain by noncarbonate crystalline rocks or from the glacial materials derived from them are soft and low in dissolved solids. The higher dissolved-solids concentrations and harder waters occur in the western area of carbonate rocks and in the central lowland area where sedimentary rocks are dominant or where large quantities of industrial wastes are discharged to the streams. Excessive iron concentrations occur in streams at scattered locations throughout the State. Some stream water is polluted and has a high bacterial count or low dissolved oxygen content, making it unsuitable for domestic or recreation use. Pollution is most serious in the Connecticut, Housatonic, and Thames rivers. (Knapp-USGS)

MIGRATION OF POLLUTANTS IN A GLACIAL OUTWASH ENVIRONMENT,
Washington State Univ., Pullman.
James W. Crosby, III, Donald L. Johnstone, Charles H. Drake, and Robert L. Fenton.
Water Resources Research, Vol 4, No 5, pp 1095-1114, October 1968. 17 fig, 1 tab, 17 ref.

Descriptors: *Pollutants, Groundwater, *Infiltration, Coliforms, Enteric bacteria, Nitrates, Chlorides, *Capillary conductivity, Soil moisture.
Identifiers: Drain fields, *Test holes, Annual precipitation, Leach bed, Spokane River Valley.

A test drilling program was conducted in a drain field area of the Spokane Valley, Washington to study the movement of pollutants in glacial outwash deposits when they are subjected to extreme pollutant loads. Contrary to what might be expected, very dry soils were found at depths beneath the drain field, and it is concluded that most of the waters are being dispersed laterally by capillary mechanisms. Much of the systemic water may ultimately be returned to the atmosphere by evapotranspiration. Moisture conditions in the drain field system strongly indicate that groundwater recharge through incident precipitation in this part of the Valley would be highly improbable. Chemical pollutants are found to travel with moisture fronts, but fine materials are determined to be very effective in filtering bacteria within a relatively few feet of the leach bed. (Seneca-Rutgers)

A STUDY OF GROUND-WATER CONTAMINATION DUE TO OIL-FIELD BRINES IN MORROW AND DELAWARE COUNTIES, OHIO, WITH EMPHASIS ON DETECTION UTILIZING ELECTRICAL RESISTIVITY TECHNIQUES,
Ohio State Univ., Columbus.
Ronald S. Boster.
Water Resour Res, 1967. 191 p, 22 fig, 11 plate, 12 tab, 34 ref. OWRR Project A-004-Ohio.

Descriptors: *Groundwater, *Contamination, *Aquifers, *Wastes, Oil fields, *Brines, *Electrical resistivity, Saline water, Salinity Oil wastes, *Ohio, Instrumentation, Oil wells.
Identifiers: *Ground-water pollution.

During a 5-yr period after an oil boom in Morrow County, Ohio, a serious contamination of groundwater aquifers occurred because of the lack of necessary conservation efforts. Millions of gallons of oilfield waters were disposed of through unlined bulldozed pits and truckloads of brine were dumped into Shaw and Whetstone Creeks, the 2 main effluent streams traversing the major production area. A study was initiated to determine the sources, severity, areal extent, and future movement of polluted ground water. This study established the importance of the ion-exchange phenomena, which may greatly extend the time period required for natural clearing of an enclave. Resistivity studies were very effective in detection of contaminated ground waters and reinforced the above contention. Practical application of resistivity shows it can be a valuable investigative and diagnostic tool in ground-water pollution and has a decided advantage over chloride and conductivity analysis in that fewer observation wells are required.

WATER QUALITY ALTERATION THROUGH ACID AND HEAT POLLUTION IN A 1500 ACRE RESERVOIR,
Missouri Univ., Columbia.
Robert S. Campbell, James R. Whitley, and Edward R. Brezina.
Water Resour Res Center Proj Rep 1, Mar 1966. 33 p, 8 fig, 9 tab, 1 ref. OWRR Project A-004-Mo.

Descriptors: Water quality, *Water pollution, Turbidity, Heated water, Mine acids, Fly ash, Plankton, Aquatic life, Alkalinity, pH, Animals, *Fishkill, Acidity, Hydrogen ion concentration, *Thermal pollution, Industrial wastes.

An investigation was made to evaluate the influence of several effluents on water quality, the biota, and the autotrophic aspects of community metabolism. Certain physical and chemical conditions vary throughout the reservoir in a pattern related to the site of hot water discharge. The most conspicuous environmental variant is water temperature, which ranges from 37 deg C at the steam plant discharge canal to 21 deg C at the western end of the lake. Dissolved oxygen range was 0.2 to 11.0 ppm, with the lower values from the deeper more stagnant water at the eastern and western ends of the lake. No evidence was found of alkaline drainage into the reservoir. At the time of reported fish kills, 1962-63, fly ash was piled adjacent to the reservoir. Fly ash is now stored in bins protected from the weather. Preliminary inspection of the plankton and bottom fauna suggests that the fauna is not rich.

JACKSON V ATLANTIC COAST LINE R R (RIPARIAN'S RECOVERY FOR POLLUTION).

317 F 2d 95 (4th Cir 1963).

Descriptors: Oil wastes, *Nuisance (Water law), Judicial decisions, *Remedies, Riparian land, Pollution (Stream), South Carolina, Railroads.
Identifiers: Damages (Exemplary), Negligence.

Oil spillage from a railroad yard was discharged into an adjacent ditch which in turn emptied into a stream. The waste was carried downstream and washed upon the land of a lower riparian owner resulting in appreciable damage. The owner sued the railroad on the theory of negligence and was awarded compensatory and punitive damages. The railroad appealed the award of punitive damages alleging plaintiff's failure to prove negligence. This court affirmed the decision of the trial court, holding that the precipitation of oil upon the riparian owner's land was a continuing nuisance entitling him to recover damages without proof of negligence. Moreover, the continuation of the deposits despite repeated complaints by the owner was ample support for the award of exemplary damages. (Geraghty-Fla)

FISH KILLS BY POLLUTION, 1966: SEVENTH ANNUAL REPORT.

Fed Water Pollut Contr Admin, Publ No CWA-7, 1967, 17 p, 11 tab, 4 rep.

Descriptors: *Fishkill, Water pollution effects, Fish conservation, Aquatic environment, Industrial wastes, Municipal wastes.

An estimated 9,115,000 fish were reported killed by identifiable pollution sources in 46 States during 1966. There were 95 other reports of fish kills in which pollution was suspected by the source could not be definitely determined. The total of reported kills is 2,500,000 less than in 1965 when 44 States reported kills of 11,784,000. The decline may have been actual or it may have been due to variations in reporting between the two years. The average number of kills was greater in 1966 than in 1965. The two worst cases of fish kills in 1966 - one million each - were caused by two of the most difficult problems facing pollution control experts - mine drainage and over-enrichment of water by municipal and other wastes. The annual fish kill census is gathered through the cooperation of individuals, State fish and game agencies, and water pollution groups.

MANIPULATION OF RESERVOIR WATER FOR IMPROVED QUALITY AND FISH POPULATION RESPONSE,
Wisconsin Conser Dep Water Resources Res Sect, Madison.
Russel C. Dunst.
Wis Conserv Dep Impoundment Stud Proj Annu Progr Rep 1966, 9 p, 1966. 88 tab. OWRR Project B-004-Wis.

Descriptors: *Data collections, *Impoundments, *Water quality, *Biological properties, *Stratification, Eutrophication, Temperature, Water circulation, Mixing, Fish, Wisconsin.

Water management techniques for impoundments are being studied to determine their effects on water quality and fish populations. The biological and environmental factors being studied include water temperature, dissolved oxygen concentration, nutrient content, water clarity, the composition and density of the bottom organism population, and several parameters of the fish population. The Cox Hollow Lake artificial circulation experiment was of primary interest during 1966. An Aero-Hydraulic System was installed on July 1, 1966; the impoundment, the inlet streams, and the discharge waters were studied before and after installation of the system. The severe stratification, present before circulation was operated, did not appear. Only a 6 deg difference between top and bottom water developed, and surface water temperature never exceeded 78 deg, which is estimated to be 7-8 deg below normal. Dissolved oxygen was present at the bottom for the first time. Algae blooms did not occur. Nutrient concentrations decreased. (Knapp-USGS)

Identifiers: Waste management.

In May 1965, a feasibility study concerning the recovery of wastes from the desizing of fabrics as an approach to the alleviation of stream pollution by textile processing operations was initiated. It was the objective initially to examine the possibilities of recovering existing sizes, and examine the possibilities of using materials of known ease of recovery from aqueous solution as possible sizes. A search of the chemical literature concerning warp-size wastes, as well as other sources of pollution from textile mills was made. This annotated bibliography has been key-word coded and indexed to aid in retrieval of this information. The coding, whenever possible, was done according to the Thesaurus of Engineering Terms published by the Engineering Terms published by the Engineers Joint Council.

INFILTRATION AND PERCOLATION OF SEWAGE THROUGH OAHU SOILS IN CESSPOOL LYSIMETERS,
Hawaii Univ., Honolulu.
Melvin K. Koizumi, Nathan C. Burbank, and L. Stephen Lau.
Tech Rep 2, Aug 1966. 49 p, 18 fig, 6 tab, 25 ref, 4 append. OWRR Project A-001-Hi.

Descriptors: *Infiltration, *Percolation, *Sewage, Sewage disposal, pH, Sewage treatment, Soils, Lysimeters, Oxidation, Flow nets, Laboratory tests, Soil physical properties, Permeability, *Cesspools.
Identifiers: Oahu, Hawaii.

This study investigated conditions contributing to cesspool failure and followed selected parameters to measure the degree of treatment afforded sewage in cesspool disposal. This laboratory study utilized bench scale soil lysimeters and 2 basic soil types: the Wahiawa Low Humic Latosol and the Lolekaa Humic Latosol. A 99% reduction of the infiltration rate was evidenced by the Wahiawa soil over the experiment-period of 30 to 40 days. Both sewage-fed lysimeters containing the Low Humic Latosol developed a panlike layer of soil fines approximately 3 cm below the bottom of the cesspools, preventing the penetration of suspended solids after 7 days. The Lolekaa soil did not show such changes. Flow nets plotted from pressure readings of the Wahiawa Low Humic Latosol showed that clogging occurred in the 8 to 10-cm zone of the side wall and the soil base of the lysimeters containing this soil. Flow through the lysimeter was governed by infiltration, rather than percolation. The results of this experiment indicate that unless further degradation of the effluent is effected by the soil mass, incomplete degradation of the sewage makes it a definite hazard to groundwater sources. This study presents soil-effluent interraction at a 1-ft depth.

ELECTRODIALYSIS IN ADVANCED WASTE TREATMENT.
Cincinnati Water Research Laboratory, Robert A Taft Sanitary Engineering Center), Ohio.
J. Douglas Smith, and John L. Eisenmann.
Fed Water Pollut Contr Admin, Publ WP-20-AWTR-18, Feb 1967. 219 p, 32 fig, 42 tab, 3 chart, 19 ref, 5 append.

Descriptors: *Tertiary treatment, *Electrodialysis, Demineralization, Economics, Membrane.
Identifiers: Wastewater renovation, Deionization.

A bench-scale experimental study was made to determine the practicality of partially demineralizing municipal waste water by electrodialysis. Using filtration alone and filtration followed by carbon adsorption as pretreatments, long term runs were made with a municipal secondary effluent to determine scaling and fouling effects of the water upon the electrodialysis membranes. During these runs a study was made to determine how high a ratio of product rate to concentrate rate could be obtained without forming scale on the membranes. Some fouling of anion membranes occurred with filtration and carbon adsorption pretreatment; without carbon adsorption, fouling was much worse. Scale formation was not a problem at product to concentrate ratios less than ten. At times much higher ratios were obtained without difficulty. The results of these runs indicated that the total operating cost for a 10-mgd electrodialysis treatment plant might be less than 10 cents per 1,000 gal. Information is presented on the relative selectivity of the membranes for the common ions in waste water. Included are data on the long term runs in which actual waste water was used, and some data on laboratory prepared solutions.

SUMMARY REPORT ADVANCED WASTE TREATMENT PROGRAM, JULY 1964-JULY 1967,
Fed Water Pollut Contr Admin, Cincinnati, Ohio.
Robert A. Taft.
Fed Water Pollut Contr, Res Ser Publication WP-20-AWTR-19, 96 p, 1968. 36 fig, 17 tab, 24 refs.

Descriptors: *Wastewater treatment, *Tertiary treatment, *Activated carbon, *Electrodialysis, *Ion exchange, *Reverse osmosis, Ultimate disposal, Cost analysis, Economic feasibility, Technical feasibility, Research and development.
Identifiers: Clarification, Advanced waste treatment, Nutrient removal.

Results of waste-treatment studies from 1964-67 are summarized. The treatment methods studied include solids removal, organic removal, inorganic removal nurtient removal, and ultimate disposal. Lime clarification, which removes suspended solids and dissolved phosphates, is also used in potable water supply systems and is economically favorable. Alum clarification should be successful at a cost of 8 cents per 1,000 gals. Activated, granular, and powdered carbon treatment should cost 8-12 cents per 1,000 gals if the carbon can be reactivated. Electrodialysis should cost 16 cents per 1,000 gal if fouling of membranes is eliminated by pretreatment of influent. Ion exchange and reverse osmosis should be competitive with electrodialysis. Nitrogen removal is a difficult problem, for which air-stripping of ammonia appears feasible and should not cost over 2 cents per 1,000 gals. Highly nitrified activated carbon or liquid effluent shows promise for ultimate nitrate removal. Knapp-USGS)

5E. Ultimate Disposal of Wastes

DISPOSITION AND CONTROL OF URANIUM MILL TAILINGS PILES IN THE COLORADO RIVER BASIN.
Federal Water Pollution Control Administration, Denver, Colo.

Fed Water Pollut Contr Admin Rep, Mar 1966. 36 p, 3 tab, 38 photo, 18 ref.

Descriptors: *Ultimate disposal, *Colorado River Basin, Waste dumps, Waste disposal, Mine wastes, Bibliographies, *Radioactive waste disposal, Water pollution.
Identifiers: *Uranium mill tailings.

This report on the disposal and control of uranium mill tailings piles in the Colorado River Basin reflects the concern of the Federal Water Pollution Control Administration with all aspects of the various radiochemical waste sources which have a potential for pollution of Colorado River Basin waters. The purpose of this report is to evaluate the radioactivity content of uranium mill tailings piles in the Colorado River Basin, to evaluate their radioactivity water pollution potential insofar as this is possible, and on a case by case basis, to indicate feasible and desirable remedial measures for controlling and limiting the spread of radioactivity from the piles.

5F. Water Treatment and Quality Alteration

INFLUENCE OF TURBULENCE ON SURFACE REAERATION,
Illinois Univ., Urbana.
E. R. Holley, and K. K. Klintworth.
Water Resour Center Rept, Sept 1966. 42 p, 9 fig, 1 tab, 11 ref. OWRR Project A-001-Ill.

Descriptors: *Turbulence, *Reaeration, Flow characteristics, Analysis, *Oxygenation, Temperature, Time, Diffusion, Anemometers, Calibrations, Instrumentation, Heat transfer, Experimental data, *Water purification, Water treatment, Water pollution control, Water quality control, Hot film anemometers.

Some numerical methods are described for determining vertical diffusion coefficients as a function of vertical coordinate in a turbulence vessel where there are no net velocities. It is planned to use this turbulence vessel and these numerical methods to study in detail the mechanics of diffusion of a substance (analogous to oxygen) which is absorbed at the free surface. A hot-film anemometer is to be used to make direct measurement of turbulence parameters affecting the diffusion process. The anemometer has been calibrated in water which was in solid body rotation. Some of the difficulties experienced with the hot-film sensor and corrective measures used are discussed. Preliminary diffusion tests have been made in the turbulence vessel where turbulence is generated by vertically oscillating screens made of expanded metal. Some values of the vertical diffusion coefficient have been calculated from the data for 2 of these preliminary runs. Plans call for more detailed diffusion studies and for making direct turbulence measurements in studying surface reaeration.

DRINKING WATER ANALYSIS PROGRAM, 1961-1966,
National Center for Urban and Industrial Health and National Center for Radiological Health, Washington, D. C.

Radiol Health Data and Rep, Vol 9, No 8, pp 442-448, Aug 1968. 2 tab, 6 ref.

Descriptors: *Data collections, *Radioactivity, *Potable water, *Water quality, Radiochemical analysis.
Identifiers: Drinking water standards.

Radioactivity concentrations of public drinking water supplies of about 800 communities in the U S are tabulated and standards are briefly outlined. The analyses were of samples collected between 1961 and 1966. They include Dr-90, dissolved alpha radioactivity, suspended alpha radioactivity, dissolved beta radioactivity, and suspended beta radioactivity. The drinking water standards for radionuclides are conservative in their requirements. The standards provide for the approval of water supplies, based on their radionuclide content, when the water does not contain more than 3 pCi/liter of radium-226 or 10 pCi/liter of strontium-90. In the absence of strontium-90 (much less than 10 pCi/liter), and in the absence of alpha emitters (much less than 3 pCi/liter), the water supply is acceptable when the gross beta concentration does not exceed 1,000 pCi/liter. However, a water supply may be approved when the limits prescribed above are exceeded if it can be demonstrated by surveillance that the total intake of radioactivity from all sources is within the guidance recommended by the Federal Radiation Council for control action. When mixtures of radionuclides are present, the relative contribution of each radionuclide to the total intake of the individual should be considered when evaluating the exposure. (Knapp-USGS)

REMOVAL OF COLOR FROM SOUTH KOHALA WATER: HAWAII,
Hawaii Univ., Manoa.
Nathan C. Burbank, Jr., Po Lau Chan, and Reginald H. F. Yound.
Tech Rep 14, Water Resour Res Center, Aug 1967. 22 p, 8 fig, 4 tab, 24 ref. OWRR Project A-013-Hi.

Descriptors: Water quality control, *Water purification, Coagulation, Zeta potential, Plant pigments, Water pollution effects, Chemical precipitation, Surface waters, Humic acids, Water treatment, Filtration, *Color, Physical properties, *Water quality, Colloids, Refractivity, Ion exchange.
Identifiers: Peptization.

The waters of the streams in the South Kohala district, on the island of Hawaii, have long been noted for extremely high color and a distinct peaty taste. Early attempts at treatment revealed that color bodies occurring in the water were refractive in nature and difficult to remove. At the end of 1 yr of research into the problem of removal of color from water, it has been found that color bodies are predominantly organic and characteristic of humic and tannic acids of vegetable origin. Color of the water has varied from a maximum value of 320 units to a minimum value of 22 units, the average is 80 units. Zeta potential of the color colloid complex has varied from 36 mv to 18.5 mv. Coagulation and removal of the color can be achieved using alum or ferric sulfate. Alum with an average dosage of 25 mg/1 can reduce color level from 140 to as low as 10 mg/1 while ferric sulfate at an average dosage of 20 mg/1 can reduce color level of water to as low as 5 color units over a wide range of pH values (6.0 to 8.5). Such color reduction permits water to meet the Public Health Service standards for interstate carriers. The use of coagulant aids holds great promise for successful color removals at lower coagulant dosage.
W69-00983

THE FORMALDOXIME DETERMINATION OF MANGANESE,
Mine E. Enginun, and Robert S. Ingols.
Pap, Ga Acad Sci Conf, Statesboro, Ga, Apr 1966. 5 p, 3 fig, 2 ref. OWRR Project A-0050Ga.

Descriptors: Potable water, *Colorimetry, Chemical analysis, *Water treatment, Bacteria, Bactericides, Biological propeties, *Manganese.
Identifiers: Reproducibility, Formaldoxime procedure.

This paper reports on studies with the formaldoxime procedure for determining manganese. For research only pure samples of manganic oxide have been in contact with the bacterial culture medium so that no interference from iron has been encountered but an evaluation has been made on effects of cyanide in manganese color density. For very small quantities of manganese the formaldoxime procedure of Siders may be modified to give good reproducability by eliminating cyanide (when there is no iron present in the samples tested) and gum Ghatti if the absorbance is measured with half an hour. One drop of 5% freshly prepared peptone solution is recommended when more time is needed before optical density readings are taken or when cyanide is used to reduce iron interference.

FLOOD HAZARD PERCEPTION IN THE PAULINS KILL VALLEY, WARREN COUNTY, NEW JERSEY,
Rutgers-The State Univ., Newark, N. J., Geography Dept.
Jacquelyn L. Beyer.
NJ Water Resour Res Inst, Res Proj Tech Completion Rep, Oct 1967. 30 p, 4 fig, 10 tab, 25 ref. OWRR Project B-007-NJ.

Descriptors: *Attitudes, *Behavior, *Channel improvement, Control, *Decision making, *Delaware River, Federal Government, Flood control, Flood damage, *Flood plain insurance, *Flood plains, Flood protection, *Flood plain zoning, *Floodproofing, *Floods, *Floodways, *New Jersey, Planning, Regulation, Social aspects, Urbanization, Local governments.

The purpose of the project was to examine assessment of flood hazard by occupiers of a flood plain in a small town on a tributary of the Delaware River. The basis for the study was the assumption that the technical assessment of the hazard would differ considerably from the users' perception and that the difference can be clarified by systematic investigation through interviews and questionnaires. In addition to questionnaires, field work for mapping and consultation with technical experts was carried out. Quality of the data obtained was satisfactory and meaningful conclusions with respect to general land-use planning problems offered. The article prepared for publication and based on this research should be helpful in providing some guidelines for individual and public decision making. This is especially so as the pace of urbanization increases in the region in which the study town is located.

5G. Water Quality Control

BEHAVIOR OF SELECTED PESTICIDES WITH PERCOLATING WATER IN OAHU SOILS,
Hawaii Univ., Honolulu.
Marshall A. Eto, Nathan C. Burbank, Jr., and Howard W. Klemmer.
Tech Rep No 9, Aug 1967. 35 p, 16 ref, 6 tab, 41 ref. OWRR Project A-001-Hi.

Descriptors: *Pesticides, *Percolation, Pesticide kinetics, *Pesticide removal, Adsorption, Waste assimilative capacity, Organic pesticide, Infiltration, Ion transport, Path of pollutants, Lysimeters, Soil contamination effects, Clay loam, *DDT, Absorption, Volatility, Leaching, Organic matter, Organic wastes.
Identifiers: *Lindane.

This study investigated the ability of 2 Oahu soils, Wahiawa and Lahaina, to prevent chlorinated hydrocarbon pesticides, DDT and Lindane, in acetone solutions from percolating through soils. Wahiawa and Lahaina soils were effective in withholding DDT under saturated and intermittent flow conditions. Breakthrough of Lindane was noted in Wahiawa and Lahaina soil under saturated flow and under intermittent flow conditions in Wahiawa soil only. Breakthrough concentrations were generally in the order of 0.3 ppm or lower. Breakthrough of Lindane and concentrations in the percolant were in direct proportion to soil volume. Column analysis showed that, in most cases, Lahaina soil held both pesticides in the upper 3 in. while Wahiawa soil held only DDT in the same region. Lindane was evenly distributed through the Wahiawa columns with a slightly greater amount held at the surface. Five Oahu soils tested to determine their ability to sorb pesticides from water-acetone solutions effectively removed pesticides in solute concentrations up to 100 ppm. DDT and Lindane were removed in the order of 90 to 100% by swirling the soils in the pesticide solutions. No desorption occurred with water, but both pesticides were desorbed with benzene.

DECONTAMINATION OF RADIOACTIVELY CONTAMINATED WATER BY SLURRYING WITH YZAOO AND ZILPHA CLAYS,
Mississippi State Univ., State College.
William A. Goldsmith.
Dep Civ Eng Pap, Jan 1966. 74 p, 16 fig, 13 tab, 51 ref. OWRR Project A-004-Miss.

Descriptors: *Radioactive waste disposal, Nuclear wastes, *Radioactive wastes, Radioactivity, Radioisotopes, *Adsorption, *Clays, Colloids, Cation exchange, Montmorillonite, Kaolinite.
Identifiers: Double layer.

The benefits derived from the advancing use of nuclear technology have been accompanied by problems which have never been encountered before. One main problem to nuclear industry is waste disposal. A review of the available literature reveals that some natural clays possess the ability to adsorb radioisotopes. Chemical and mineralogical properties of Yazoo and Zilpha clays suggest they might be useful as adsorbers of radioisotopes. This investigation was made to determine whether Yazoo and Zilpha clays are useful adsorbers of 3 radioisotopes: cobalt 60, stronium 90, and cessium 137. This was accomplished by slurrying a mixture of radioisotopes and tap water with varying dosages of Yazoo and Zilpha clays. Results obtained suggest that Yazoo clay is an effective adsorber of each radioisotope tested. No generalization can be drawn from results obtained concerning effectiveness of each clay for all radioisotopes, therefore, these results should be used as the basis for further investigation.

THE LAW OF WATER POLLUTION CONTROL,
Mississippi State Univ., State College.
P. H. Williams, L. L. McDougal, and William M. Champion.
Water Resour Res Inst Tech Rep, 1967. 18 p. OWRR Project A-014-Miss.

Descriptors: *Legal aspects, Federal government, Political aspects, State governments, State jurisdiction, Water quality control, Mississippi, Compatibility, Legislation, *Pollution abatement, *Water pollution control.
Identifiers: Water Quality Act, 1965.

The objectives of this study were to assess the present legal prescriptions relating to water pollution in Mississippi, compare these prescriptions with the Federal standards, and prepare legislation and regulations necessary to harmonize the law of this State with such Federal standards. The

LIBRARY U. OF I. URBANA - CHAMPAIGN

research under this project pursued a comprehensive examination of the problems relating to water pollution and governmental efforts to control such pollution. In analyzing the problems presented, the study first considered broad questions involving desirability of state versus Federal control of water quality. Study then was directed to requirements of Federal statute and guidelines, the Mississippi pollution control scheme prior to enactment of the Federal Act, and the new Mississippi water quality control law. The study then considered the Mississippi Air and Water Pollution Control Act to determine its compliance with Federal requirements, and concluded with desirable recommendations and alternatives.

POLLUTION OF WATERS.

Fla Stat 387 (1967).

Descriptors: Florida, *Legislation, *Underground streams, *Water pollution, Lakes, Rivers, Ditches, Streams, Cities, Septic tanks, Sewage disposal permits, *Surface-groundwater relationships, Surface waters, Drainage effects, Drainage water.

This chapter of the Florida Statutes is primarily concerned with the pollution by sewage of the underground waters of the state. It also covers pollution of lakes, rivers, streams, and ditches. It further requires that where septic tanks are used that they conform to FHA requirements. The statute provides that violations shall generally be punished as misdemeanors, although there are variations in fines according to the section violated. The State Board of Health is responsible for supervision of this act. In addition to fine and imprisonment, injunctions are available where appropriate. (Crabtree-Fla)

FEDERAL POLLUTION CONTROL,
H. W. Poston.
American Water Works Ass'n Jour, Vol 58, No 9, pp 1108-1112, Sept 1966. 5 p.

Descriptors: *Water pollution, Pollution abatement, *Federal project policy, Federal government, Sewage treatment, Water quality control, River basins, *River basin development, Research and development, Federal budgets.

The Federal Water Pollution Control Act as amended by the Water Quality Act of 1965 established a Federal Water Pollution Control Administration. This agency was transferred from the Dept of Health, Education and Welfare to the Dept of the Interior in 1966. The expanded Federal Water Pollution Control Program includes six main activities: (1) aid to communities for waste treatment -- the federal government can pay up to $1,200,000 for a single project and $4,800,000 for a multi-municipal project; (2) enforcement -- if pollution from one state endangers another, the Secretary of the Interior can take action to abate the pollution; (3) research -- the federal government is building twelve new laboratories for studies in renovating waste water; (4) river basin programs - there are projects in ten major basins at present with plans for programs in all this country's major basins. The government has set up water quality standards for water users. Standards are set by the federal government only after states have failed to established their own. Finally the federal government provides scientists and engineers to states and industries for technical assistance. New bills are being introduced, including a $6 billion program for sewer works construction and a pollution control bill under a river basin approach. (Kahle-Fla)

FEDERAL WATER POLLUTION CONTROL ADMINISTRATION, DEPARTMENT OF THE INTERIOR.
18 CFR Ch 5 Sec 601.0-601.25 (1968).

Descriptors: *United States, Legislation, *Grants, *Water pollution treatment, *Sewage treatment, Sewers, Public benefits, Navigable waters, Treaties, Public health, Wages, Projects, Water supply, Conservation, Regulation, Administration, Administrative agencies.
Identifiers: *Federal Water Pollution Control Act, FWPCA.

The Act establishes grants for states and interstate agencies for the prevention and control of water pollution. The requirements for and the methods of making the grants are provided. A plan must be submitted to the Commissioner in applying for a grant. The Act also provides: (1) the formula for determining payment amounts; (2) the factor's used by the Commissioner in determining the desirability of treatment works projects; and (3) the criteria for considering the propriety of federal aid. All applicants must insure certain described labor standards by providing for them in contracts for project work. Subpart C provides for grants to demonstration projects for the control of discharges from stormwater or combined sewer systems. The requirements and regulations for these grants are described. Subpart D provides for grants to qualifying research, training or demonstration projects. Grants for fellowships for research, of the causes, prevention and control of water pollution are established. The Secretary of the Interior may certify facilities under Section 48 (h) (12) of the Internal Revenue Code as being within the requirements for water pollution control under the listed standards. Public hearings are provided for. (Childs-Fla)

APPLICATION OF CITY OF JOHNSTOWN (SEWAGE DISPOSAL AND WATER POLLUTION).

12 App Div 2d 218, 209 NYS 2d 982-985 (1961).

Descriptors: Judicial decisions, *New York, *Water pollution, *Sewage disposal, Water pollution control, Streams, Sewage, Administrative agencies, Fresh water, Odor, Public health, Preferences (Water rights), Non-navigable waters, Cities, Municipal wastes, Administrative decisions.

The City of Johnstown sought review of an order of the Water Pollution Control Board requiring it to discontinue disposal of untreated sewage into a creek which had been classified to permit such use only if it did not cause a public nuisance. The court found that noxious odors emanating from the stream were caused by the city's sewage, and that this condition annoyed and endangered the comfort, repose, and health of a 'considerable number' of persons, thus constituting a public nuisance. The Board had power to classify the stream because 'waters of the state' included all fresh water in streams, public or private; thus the fact that the creek here was non-navigable and owned by private riparian owners had no effect on the Board's power to classify. The city's argument that the classification and order were an interference with a 'property right' was untenable, since such rights do not attach to the water itself, and are required to yield to public health and safety. The court confirmed the Board's order. (Smodish-Fla)
W69-00783

AN ACT RELATING TO PROTECTING SOURCE OF PUBLIC WATER SUPPLY.
Maine Public Law Ch 341 (1967).

Descriptors: *Maine, Water supply, *Cities, *Intakes, Legislation, Water quality, Regulation, Utilities, Water pollution sources, Water pollution control, Industrial wastes, Sewage, Pollution abatement.

Section 2436 of the Maine Revised Statutes is amended. Any water utility or municipality is authorized to take reasonable methods to protect its public water supply. It may enter land within 1000 feet of any lake, pond, well, spring, river or stream, from which it draws its water supply. Any health inspector or officer may order the owner of any building on such land, which has a system of drainage or sewage flowing or seeping into the source of the water supply, to remedy the situation. The order is to be written and set a time limit for compliance. This act is in no way to limit any private or special acts giving water utilities or municipalities greater powers to protect their sources of public water supply. (R. F. Williams-Fla)
W69-00792

AN ACT TO CREATE THE AIKEN COUNTY AIR AND WATER POLLUTION COMMISSION AND TO DEFINE ITS POWERS AND DUTIES.
South Carolina Laws 1967, No 221.

Descriptors: *South Carolina, Legislation, *Water quality, Water pollution control, Local governments, *Administrative agencies, Political aspects, Industrial wastes, Standards.

An eleven-member Aiken County Air and Water Pollution Commission is created. The commission is to maintain surveillance to insure a reasonable degree of purity of the county's water resources. It shall investigate the quality of water where necessary, keeping a particular watch for industrial pollution. The commission is to report and make recommendations to the county's legislative delegation. Cooperation among polluters to attempt to control pollution is encouraged. The commission is authorized to contract in connection with its duties, accept grants and gifts, and to investigate and hold hearings. This act is not to infringe on any duties of the Pollution Control Authority, and the commission's duties are intended to assist the county's legislative delegation in maintaining the health and welfare of the people of Aiken County. (R. F. Williams-Fla)

UNITED ELECTRIC COAL COMPANIES V BROWN (INSUFFICIENT EVIDENCE OF POLLUTION DAMAGE).

354 S W 2d 502-504 (Ky 1962).

Descriptors: *Judicial decisions, *Kentucky, Soil contamination, Water pollution, *Strip mine wastes, Coal mine wastes, Water pollution sources, *Damages, Streams.

The court of Appeals of Kentucky held that evidence was insufficient to establish that creek water, allegedly contaminated by defendant's strip mining operation, was injurious to plaintiff's farm land and whether such damage was permanent. Judgment for plaintiff was reversed with instructions to enter judgment for the defendant. Plaintiff offered no direct evidence that the water flowing in the stream contained chemical properties injurious to his land or crops or that injuries, if any, were of permanent nature. His case was built on circumstantial evidence which the court found insufficient. (MacMillan-Fla)
W69-00880

AUBELE V GALETOVICH (RIGHT OF RIPARIAN OWNER TO INCREASE FLOW AND POLLUTE WATER).
165 NE 2d 683-686 (Ct App Ohio 1960).

Descriptors: *Municipal wastes, Sewage effluents, Waste water, *Septic tanks, Reasonable use, Domestic wastes, Overflow, Water levels, Drainage, Surface drainage, Drainage water, Drainage effects, *Ohio, Judicial decisions.

Village residents through whose lands a natural watercourse ran, brought an action to enjoin developers and the village from casting surface waters and septic tank effluent into the watercourse above their land. The court, affirming a judgment for the defendants, held that lower riparian owners could not obtain an injunction against development of additional reparian lots merely because of the resulting increase in the flow of the watercourse. One may obtain the right to cast sewage upon the lands of another without his consent only by purchase. Plaintiffs in this case failed to establish their claims by that degree of proof necessary for an injunction. The testimony indicated that the water emitted no offensive odor and contained no foreign matter, bacteria or e-coli in greater amounts than many other such streams. (Headley-Fla)
W69-00885

CITY OF DERBY V WATER RESOURCES COMM'N (DISCHARGE OF UNTREATED SEWAGE PROHIBITED).
172 A 2d 907-911 (Conn Sup Ct Err 1961).

Descriptors: *Connecticut, Administrative decisions, Civil law, Community development, Judicial decisions, Local government, Social needs, Sanitary engineering, *Sewage treatment, Waste water treatment, Treatment facilities, Sewage, *Municipal wastes, Sewage disposal, *Water pollution.

Plaintiff, a municipal corporation, was discharging untreated sewage into two rivers in violation of state law. The State Water Commission ordered the plaintiff to submit to the commission and the state department of health detailed plans: (1) for a system to adequately treat and collect its sewage; (2) to put the project out for bids; and (3) to complete the construction of the system, all by certain dates. The plaintiff appealed from this order but it was affirmed, holding the plaintiff's claim that the order was unrealistic for financial reasons to be without merit. The court asserted that public health cannot be endangered because of a reluctance on the part of municipal authorities to face up to a city's problems and find available means for coping with them. (S. Scott-Fla)
W69-00893

VICKERS V CITY OF FITZGERALD (WATER POLLUTION).
117 S E 2d 316-320 (Ga 1960).

Descriptors: *Water pollution, *Sewage, Public rights, Damages, *Riparian rights, Riparian land, Water law, Legal aspects, Municipal wastes, *Georgia.
Identifiers: Public nuisance.

The plaintiff brought action for damages to his lakeside resort area caused by the city's dumping of sewerage into the lake. Plaintiff's petition was held to set forth a cause of action for the recovery of damages and for the granting of injunctive relief. A lower riparian owner is entitled to have water flow upon his land in its natural state free from adulteration. Since the nuisance complained of was a continuing one, and it continued to the date of the suit, the statute of limitations did not apply. (Horner-Fla)
W69-00894

AN ACT RELATING TO THE USE OF WATER FROM BIRCH LAKE AND THE SOUTH KAWISHIWI RIVER IN CONNECTION WITH MINING.

Minnesota Laws 1967, Ch 556. 2 p.

Descriptors: *Minnesota, Mining, *Mine drainage, Administrative agencies, Water quality control, Standards, *Water permits, Flooding, Non-consumptive use, State jurisdiction, Legislation, *Withdrawal.

Copper, copper-nickel mining companies are authorized to use water from Birch Lake and the South Kawishiwi River and to flood or affect state lands adjacent thereto. Permits from the commissioner of conservation are required for withdrawals. All waters withdrawn must be returned to the same drainage basin from which they were taken, in conformity with established water quality standards. Permits from the water pollution control commission are required for construction, operation and maintenance of disposal systems. Permits are also required for flooding of state lands. (R. F. Williams-Fla)
W69-00897

AN ACT RELATING TO WATER POLLUTION CONTROL: AMENDING MINNESOTA STATUTES 1965, SECTION 115.44, BY ADDING A SUBDIVISION.
Minnesota Acts Ch 203 (1967).

Descriptors: *Minnesota, *Legislation, Administrative agencies, Federal jurisdiction, Regulation, *Standards, Water quality, State jurisdiction, *Classification.

Minn Stat Sec 115.44 (1965) is amended to authorize the water pollution control commission to waive compliance with other requirements of this section with regard to classifying waters or adopting standards if it finds such to be necessary to comply with the Federal Water Pollution Control Act or any other federal law or regulation. It is also authorized to classify waters and to adopt criteria and standards to conform to federal law, notwithstanding other provisions of Minnesota law, compliance with other requirements of this section is directed where, and as soon as, possible. The commission is also authorized notwithstanding subdivision 4, to set effluent standards, regardless of whether the waters they enter are classified or unclassified. (R. F. Williams-Fla)
W69-00898

AN ACT TO AMEND 10 V S A SECS 902 AND 909 AND 24 V S A SEC 3611 AND TO REPEAL SEC 9 OF NO 139 OF THE ACTS OF 1965 RELATING TO POLLUTION CONTROL.
Laws of Vermont 1967, No 181. 2 p.

Descriptors: Financing, *Vermont, *Legislation, Administrative agencies, *Water pollution, *Sewage districts, Classification, Recreation, Water conservation, Water control, Water purification, Water quality, Water sports, Water treatment, Disinfection, Irrigation, Filtration.

Vermont classifies its water into four groups according to possible uses. Class A is suitable for public water supply with disinfection when necessary. Its character is uniformly excellent. Class B is suitable for bathing and recreation, irrigation, and agricultural uses. It is a good fish habitat with aesthetic value. It is acceptable for public water supply with filtration and disinfection. Class C is suitable for recreational boating, irrigation of crops not used for consumption without cooking, as a habitat for wildlife, and such industrial uses as are consistent with other Class C uses. Class D is suitable for supporting aerobic aquatic life, for power, navigation, and certain industrial process needs consistent with other Class D uses. Pollution of water is prohibited in Vermont except with written authorization. The board may take action against any person who reduces a body of water from one classification to another. The duties of the sewage disposal commissioners are listed. They include the power to require any person to connect to the municipal sewage system to abate the pollution of waters. (R. H. Watson-Fla)
W69-00901

AN ACT TO AMEND 10 VSA SEC 1153 RELATING TO REPORTS OF WELL DRILLERS.
Laws of Vermont 1967. No 168, 1 p.

Descriptors: *Vermont, *Legislation, Administrative agencies, Water resources, *Water analysis, Chemical analysis, Laboratory tests, Wells, *Well regulations, Drilling.

Vermont requires all well drillers to submit to the water resources board within six months after the drilling, a report of the physical and chemical analysis of a sample of water from each well drilled. The analysis may be obtained from the state health laboratory, from private facilities with the consent of the board, or from the board itself on payment of a fee of $5.00 for each analysis made. (R. H. Watson-Fla)
W69-00902

CH 254 - AN ACT RELATIVE TO THE PREVENTION OF POLLUTION FROM DREDGING, FILLING, MINING, OR OTHER CONSTRUCTION.
Laws of New Hampshire 1967, Ch 254, 1 p.

Descriptors: *Legislation, *New Hampshire, *Water pollution, Administrative agencies, Landfills, *Dredging, Excavation, Mining.

New Hampshire amended its statute on the prevention of pollution from dredging, filling, mining, or other construction. The amended statute makes any person proposing to dredge, escavate, place fill, mine or undertake construction in the surface waters of the state directly responsible for the submission of plans concerning such proposal to the commission at least 30 days prior to undertaking any such activity. The commission's written permission to conduct such operations is required. The commission has full authority to establish the terms and conditions under which the permit may be exercised. (R. H. Watson-Fla)
W69-00907

CH 145 - AN ACT PROVIDING FOR THE PROTECTION OF THE SURFACE WATERS OF THE STATE BY PREVENTING THE DEPOSIT THEREIN OF RUBBISH AND WASTES.
Laws of New Hampshire 1967, Ch 145, 1 p.

Descriptors: *Legislation, *New Hampshire, Water pollution, Administrative agencies, *Surface waters, *Wastes, Ice, Banks, Domestic wastes.
Identifiers: Rubbish, Litter.

New Hampshire amended its general water pollution statute. The statute now makes it unlawful for any person to place any bottles, glass, crockery, cans, scrap metal, junk, paper, garbage, tires, old automobiles or parts, trees or similar litter in a surface water of the state or on the ice covering the surface water or the banks. An agent of the commission shall order immediate removal of the

LIBRARY U. OF I. URBANA - CHAMPAIGN

material by the violator. If the violator refuses the agent may contract to have the litter removed and the violator will be liable for the cost of the removal in an action of debt. Also any violator will be subject to a fine of not less than $25 or more than $100. (R. H. Watson-Fla)

ALTERNATIVE ECONOMIC RESPONSES TO THE ACID MINE DRAINAGE PROBLEMS IN APPALACHIA,
Ohio State Univ., Columbus.
Richard A. Tybout.
Water Resources Center, Feb 1968. 42 p, 3 tab, 17 ref. OWRR Project A-005-Ohio.

Descriptors: *Mine drainage, *Acid mine water, Benefit-cost ratios, Mine acids, Benefits, Costs, Indirect benefits, Coal mines, Waste disposal, Strip mine wastes, Water pollution, Water pollution sources, *Pollution abatement, *Coal mine wastes, Mathematical models, Aesthetics.
Identifiers: Appalachia, Beautification.

The study consists of a cost-benefit analysis of the pollution abatement problem from acid mine drainage. Empirical information is based primarily on experiences in Pennsylvania, the only public program for abatement in effect at the present time. Costs are found in 3 parts: (1) costs of treatment; (2) costs of sealing; and (3) secondary costs. First, employment, wage, price, and production series were constructed county-by-county to isolate effects of treatment costs on employment. Second, for generalizing costs to the states, predicting mine drainage was analyzed on the basis of (1) volume of drainage per ton of coal mined, by county, with subcases for deep and strip mining with corrections for seam thickness and hydrologic conditions; (2) quality of drainage as affected by surrounding geological strata. Benefits are found for (1) municipal water treatment; (2) industrial water usage, and (3) recreation. Aesthetic improvements are also benefits, but a method of measuring is not currently available; therefore, the level of aesthetic benefits required to offset costs was determined by difference. Secondary benefits of community impact of tourist expenditures are included. Conceptual limitations to the use of secondary costs and benefits are noted.

TO INVESTIGATE THE DISPOSAL OF AGRICULTURAL PRODUCT WASTES THROUGH THE SOIL,
Maine Univ., Orono.
R. V. Rourke.
Water Resour Center Term Rep R1084-3, 1967. 8 p, 2 tab, 8 ref, append. OWRR Project A-002-Me.

Descriptors: *Particle size, *Filtration, *Biochemical, *Filters, Oxygen demand, Waste water treatment, *Pollution abatement, Topsoil, Organic waste, Porous media, *Soils.

A trial was initiated to determine the ability of various soil textures to filter the waste water effluent of a potato processing plant. The filtering efficiency was based upon the biochemical oxygen demand of the water before and after passing through a 6 inch soil layer. The trial period was for 7 weeks and consisted of a weekly irrigation of 4000 ml. of waste water to 4 square feet of soil surface. As judged by reduction of the biochemical oxygen demand the filtering efficiency of loamy fine sand was greater than that of sandy loam. Silt loam had the lowest filtering efficiency. (Author)

TERPENES FROM SULFATE PULP MILL WASTE LIQUOR: THE PRODUCTION OF CIS- AND TRANS-CARONIC ACIDS FROM DELTA-3-CARENE,
Montana State Univ., Bozeman, Chem Eng Dept.
James H. Jarrett.
Report of Accomplishment, Dec 1967. 85 p, 28 fig, 2 tab, 22 ref, append. HEW-PHS Grant No. WP-00510-05.

Descriptors: *Pulp wastes, *Pulp and paper industry, Byproducts, Industrial production, Oxidation, Oxidation-reduction potential, Sulfates.
Identifiers: Terpenes, Turpentine, Dibasic acid.

The sole known source of delta-3-carene, a bicyclic terpene, in the United States and Canada is in the by-product turpentine produced by 5 western Kraft pulp mills. The present potential supply of delta-3-carene is 1000 gallons per day. Two cyclopropane ring-containing dibasic acids (cis- and trans-caronic acids) were recovered in 99 percent purity from the mixture of oxidation products obtained by the potassium permanganate oxidation of delta-3-carene in acetone. The yield of cis-caronic acid was 6.5 percent and the yield of trans-caronic acid was 0.5 percent. The identification of cis- and trans-caronic acid was based on commercial analysis for carbon, hydrogen and oxygen, and on infrared and nuclear magnetic resonance spectroscopy. The spectra are included in this thesis.

THE EFFECT OF SELECTED HERBICIDES UPON THE GROWTH OF PLANKTONIC FRESH WATER ALGAE AND THEIR PERSISTENCE IN SURFACE WATERS,
Louisiana Polytechnic Institute, Ruston, Botany and Bacteriology Dept.
Otto Wasmer, Jr.
Louisiana Water Resour Res Inst, Louisiana State Univ, Baton Rouge, May 1967. 19 p, 11 fig, 5 ref. OWRR Project A-003-La.

Descriptors: *2-4 D, *Herbicides, *Phytoplankton, *Phytotoxicity, Algal poisoning, Scenedesmus, Chlorella, *Euglena, Algal control, Bactericides, Growth rates.

The purposes of the investigation were to determine effect of selected herbicides upon the rate of growth of certain fresh water planktonic algae; to determine effect of selected herbicides upon the physiology of these algae; and to determine morphological changes in algae exposed to herbicide presence. Due to limitations imposed by time, certain restrictions in the investigational procedures were necessary. A signal species of fresh water algae was utilized in the complete investigation, although 2 other species were examined in the morphological studies. A single herbicide was used in all phases of the study. Finally, the physiological study was confined to the effect of herbicide presence on rate of respiration in algal cells.

SUB-SURFACE IRRIGATION OF TURF AREAS, NOZZLE DESIGN AND SPACING,
Massachusetts Univ., Amherst.
Lester F. Whitney.
Project Completion Report, Jan 1968. 11 p, 5 ref. OWRR Project A-015-Mass.

Descriptors: *Subsurface irrigation, *Distribution systems, Water pipes, Irrigation, *Nozzles, Orifices, Soil moisture, Moisture content, Orifice flow, Plastic pipes, Turf, Spatial distribution, Profiles, Water utilization.

Subsurface irrigation of crops and turf areas can permit up to a 40% reduction in water usage, provide automatic irrigation, and permit introduction of liquid chemicals into the root zone. The main deterrent to widespread adoption of this method has been the absence of an orifice which resists internal and external clogging; one which approaches the longvity of the polyethethylene plastic pipe lateral system. Results from this work have culminated with an injection-molded plastic insert nozzle which pierces the plastic pipe wall such that the inlet to a sized orifice is at the point of maximum velocity within the pipe. A labyrinthian protection for the orifice prevents external clogging. All in-wall orifices have been found to be unequivocally nonuniform and short lived. Spacing of orifices have been related to soil profiles and soil types for which flow parameters have been established. The findings are significant in providing a designed orifice for subsurface irrigation with maximum protection against internal and external clogging leading to a longevity approaching that of the base pipe material.

WATER POLLUTION CONTROL IN SEMI-ARID AND ARID ZONES,
Hebrew Univ., Jerusalem, Israel.
Hillel I. Shuval.
In affiliation with World Health Organization, Geneva. Water Research, Vol 1, No 4, pp 297-308, April 1967. 12 p.

Descriptors: *Water pollution control, *Arid lands, *Semiarid climates, Water conservation, *Water utilization, *Waste water disposal, Water quality, Water reuse, Domestic wastes, Groundwater recharge, Irrigation practices, Dry seasons, Public health, Sewage treatment, Sanitary engineering, Industrial wastes.

Limited water resources in semi-arid and arid zones caused special water pollution problems. Aspects of water utilization were discussed. It was suggested urban and industrial waste waters be utilized for direct irrigation, industrial purposes and recharging and replenishing the aquifer under arid zone conditions. Israel was presented as a case study in waste water utilization. Agricultural irrigation, both restricted and unlimited, were discussed as was water recharge. (Affleck-Ariz)

ALTERNATIVE METHODS OF IMPROVING STREAM QUALITY: AN ECONOMIC AND POLICY ANALYSIS,
Johns Hopkins Univ., Baltimore, Maryland
David F. Bramhall, and Edwin S. Mills.
Water Resources Research, Vol 2, No 3, pp 355-363, Third Quarter 1966. 4 fig, 2 tab, 9 ref.

Descriptors: *Water quality control, Economics, Waste disposal, Economic efficiency, Control, Low flow augmentation, Waste treatment, Costs, Governments, Water pollution, Taxes, Streamflow, Industries, Regulation.
Identifiers: *Public policy, Effluent fees.

Neither markets nor other institutional mechanisms exist which register the benefits and costs of alternative stream qualities or of alternative methods of achieving a given stream quality. It is therefore necessary to study such benefits and costs and to design special public policies to achieve desirable stream qualities in an economical way. The two most prominent methods of improving stream quality are waste treatment and low flow augmentation. Estimates are presented of the cost of achieving given stream qualities by various combinations of waste treatment and low flow augmentation. Data is taken from the author's study of future water supply and demand in Maryland, but the conclusions are thought to be applicable through the humid eastern part of the United States. The main conclusion is that low flow augmentation is a less economical method of improving stream quality than about 90% waste removal by secondary treatment, or its equivalent in industrial process changes at the point of waste generation. Alternative public policies for achieving improved stream qualities by economic methods are evaluated. A combination of effluent fees and enforcement is judged desirable. (Seneca-Rutgers)

OPTIMAL TAXING OF WATER POLLUTION,
Chicago Univ., Illinois.
Charles Upton.
Water Resources Research, Vol 4, No 5, pp 865-875, October 1968. 11 p, 3 fig, 11 ref.

Descriptors: Marginal costs, *Water pollution, *Water management, Water quality, Efficiencies, Biochemical oxygen demand, Dissolved oxygen.
Identifiers: *Optimal taxes, *Second order conditions, Subsidy, *Low flow augmentation, Nonpecuniary externality.

This paper attempts to show that within the context of the model presented, optimal taxes on water pollution do exist. The condition for these taxes is to raise revenue sufficient to pay for the cost of low flow augmentation. The social cost of cleaner water is also calculated. The 'waste' load discharge method of taxation is then shown to be preferable to the 'increased permissible waste load method' when taxes do not cover augmentation costs. The difference between augmentation costs and taxes, the subsidy, is defined as a function of marginal and average costs of streamflow. If there are economies of scale (MC<AC), then the subsidy is negative; if there are diseconomies of scale, it is positive. Taxes will cover treatment costs if and only if the subsidy is greater than or equal to zero. The rest of the paper is a study of the effects of three schemes that were proposed in a study undertaken for the Ohio Department of Health. The three questions asked about each scheme were: is it equivalent to the optimal tax; under what special conditions is it equivalent to the optimal tax; under what conditions is it the best nonoptimal tax. (Seneca-Rutgers)

RECOVERABLE WARP SIZES - A FEASIBILITY STUDY,
North Carolina Univ., Raleigh.
Harley Y. Jennings, and Richard N. Berrier.
Water Resour Res Inst Proj Completion Rep, Oct 1965. 5 p. OWRR Project A-006-NC.

Descriptors: *Textiles, *Water pollution control, *Industrial wastes, Liquid wastes, Water pollution sources.

The objective of this study was to examine in a very limited degree the possibility of recovering and reusing textile sizes. It was concluded that textile sizes constitute a pollution problem. There is little indication that the industry will attack the problem until required to do so, and the School of Textiles at N. C. State University should develop a program aimed at reducing stream pollution by textile sizes through substitution, recovery, and reuse of size materials. (Howells-NoCarolina)

PERSISTENCY OF 2,4-DICHLOROPHENOXYACETIC ACID AND ITS DERIVATIVES IN SURFACE WATERS WHEN USED TO CONTROL AQUATIC VEGETATION.
Southwestern Louisiana Univ, Lafayette.
William K. Averitt.
Louisiana Water Resour Res Inst, Sept 1967. 67 p, 33 fig, 7 ref, append. OWRR Project A-003-La.

Descriptors: *Herbicides, *2-4 D, Persistence, Aquatic plants, *Weed control, Alligatorweed, *Aquatic weeds, 2-4-5 T, *Hyacinth (Water), Pesticide residues.

The question of persistency and residues of various herbicides in surface waters, after being treated to control aquatic vegetation, is of prime importance in the maintenance of clean water. Laboratory and field test plots were sprayed with 2,4-D to control water hyacinth and alligatorweed. In some instances the PGBEE of 2,4-D or PGBEE of 2,4-5-Trichlorophenoxypropionic acid was also used. Residue determinations of the herbicides were about 800 ppb at 1 day after spraying and diminished to almost zero in 4 months time. In another series of tests, various organic acids were used in conjunction with the herbicides mentioned. Residue levels were similar to those in the tests when the herbicide alone was employed. However, it was noticed that the use of the organic acid increased the chemical activity, and the herbicide was found to have a somewhat delayed residue appearance in the water.

ACTIVITY OF MICROORGANISMS IN ACID MINE WATER.
Ohio State Univ, Columbus.
Jon H. Tuttle, C. I. Randles, and P. R. Dugan.
Jour of Bacteriology, pp 1495-1503, May 1968. 9 p, 6 fig, 1 tab, 12 ref. OWRR Project A-002-Ohio.

Descriptors: Acidic water, Water quality, Acidity, pH, Mine wastes, Aerobic bacteria, Ecology, Chemical analysis, Iron bacteria, Bacteria, Anaerobic bacteria, Water pollution, *Microorganisms, *Acid mine water, Water sampling, Streams.

Comparison of microbial content of acid-contaminated and nonacid-contaminated streams from the same geographical area indicated that nonacid streams contained relatively low numbers of acid-tolerant heterotrophic microorganisms. The acid-tolerant aerobes survived when acid entered the stream and actually increased in number to about 2000/ml until the pH approached 3.0. The organisms then represented the heterotrophic aerobic microflora of the streams comprised of a mixture of mine drainage and nonacid water. A stream which was entirely acid drainage did not have a similar microflora. Most gram-positive aerobic and anaerobic bacteria died out very rapidly in acidic water, and they comprised a very small percentage of the microbial population of the streams examined. Iron- and sulfur-oxidizing autotrophic bacteria were present wherever mine water entered a stream system. The sulfur-oxidizing bacteria predominated over iron oxidizers. Ecological data from the field were verified by laboratory experiments designed to simulate stream conditions.

U-TUBE AERATION.
New Mexico State Univ, Las Cruces.
Richard E. Speece, and Jack L. Adams.
Tech Rep 38, Water Resour Res Inst, June 1967. 77 p, 26 fig, 3 tab, 8 ref, 2 append. OWRR Project A-011-NMex.

Descriptors: Water pollution, *Oxygen sag, Free surfaces, Diffusion, Air-water interfaces, *Dissolved oxygen, *Aeration, Dissolved solids, Solubility, Saturation, Oxygen, Low flow, Bubbles.

The diffused air U-tube aerator is especially adapted to capitalize on factors which increase oxygen transfer from air to water. It allows the contact time between the air bubble and water to be increased. The air-water interfacial area can be easily controlled. It allows the DO deficit to be increased. Finally, the diffused air U-tube aerator allows operation under a positive, zero, or negative head. Results of experimentation show that oxygen transfer in the U-tube is a function of air-water ratio, depth of U-tube, nominal water velocity, and air diffuser submergence. Results with pure oxygen injection showed about 5-fold increase in DO over air injection. A U-tube 40-ft deep, with a nominal water velocity of 8.4 ft/sec, and air injected at 1-ft submergence raised the DO from 0.2 to 4.0 mg/l. Difference in free water surface across the system was 5 in. Under the above conditions 13.8 lb of oxygen was transferred per hp-hr. Under conditions where 5 in. of head efficiency would be 85.4 lb of oxygen per hp-hr. Under standardized conditions, oxygen transfer rates in excess of 20 lb of oxygen per hp-hr were achieved.

TIME-INTEGRATED THERMAL EFFECTS OF FOREST IRRIGATION.
Pennsylvania State Univ, University Park.
Richard Lee, and William E. Sharpe.
Pap, 8th Nat Conf Gr Meterol, Ottawa, Canada, May 1968. 16 p, 5 fig, 5 tab, 24 ref. OWRR Project A-012-Pa.

Descriptors: *Forestry, Irrigation, *Temperature, Energy balance, Trees, Ecology, Sewage effluents, *Sewage treatment, Sensors, *Forests, Instrumentation, *Sprinkler irrigation, *Heat, Heat budget, *Waste treatment.

Changes of forest microclimates are reported as reflected in mean temperatures at various levels in treated stands. Irrigation treatments of 1 or 2 in. of treated municipal effluent were applied weekly, April through October 1967. The effluent was disinfected, clear, and odorless but not potable. Sprinklers were located 3 ft above ground level or above the canopies. Temperature sensors were placed in the upper 6 in. of mineral soil, 4-1/2 ft, and at 3 levels in the canopy, 28-, 33-, and 38-ft heights in Red Pine and 33-, 43-, and 53-ft heights in the hardwoods. A special temperature-sensing technique integration was used. Results of the investigation, with interpretation and significance are given.

INSECTICIDE ADSORPTION BY LAKE SEDIMENTS AS A FACTOR CONTROLLING INSECTICIDE ACCUMULATION IN LAKES,
Wisconsin Univ, Madison, Wisconsin.
Erik G. Lotse, Gordon Chesters Graetz, and Gerhard B. Lee.
Rep, July 25, 1967. 42 p, 10 fig, 10 tab, 5 ref. OWRR Project B-008-WIS.

Descriptors: Adsorption, Pesticide kinetics, *Insecticides, Bottom sediments, Lake soils, Radiochemical analysis, Organic matter, Bonding, Clay minerals, Particle size.
Identifiers: Chlorinated hydrocarbons, Multiple regression, Lindane.

Lindane (gamma isomer of benzene hexochloride) adsorption was determined on eight intact lake sediments using a radiochemical technique. Lindane adsorption was shown to be affected by sediment suspension concentration, organic matter content, lindane concentration, clay content and lindane-sediment ratio and to obey Freundlich's equation. As the lindane molecule is neutral and not subject to ionization, van der Waals forces and hydrogen bonding were considered the most feasible adsorption mechanisms. The chlorine atoms of lindane are the most likely bonding sites to hydroxyl groups residing on the surfaces of the organic and mineral components of the sediments.

TRICKLING FILTERS AS A DAIRY-MANURE STABILIZATION COMPONENT,
Massachusetts Univ, Amherst.
D. O. Bridgham, and J. T. Clayton.
Manage Farm Animal Wastes, Amer Soc Agr Eng, St. Joseph, Mich, pp 66-68, 1966. 3 p, 6 fig, 3 tab, 9 ref. OWRR Project A-009-MASS.

Descriptors: *Trickling filters, Filters, *Waste treatment, Sewage effluents, *Farm wastes, Effluents, Settling Basins, *Cattle, *Dairy industry, Wastes, Biochemical oxygen demand, Pollution abatement.

Trickling filters are an effective means of reducing the polluting qualities of dairy manure and a possible means of treating effluent for discharge or recirculation. Loading rate and waste temperature have a great effect on the quality of the effluent. Nine points were plotted for this experiment and labeled according to average BOD of the effluent under respective conditions. Assuming a linear relationship between points, a topograph was drawn for various qualities of effluent. With bubbling aeration, a 1000-lb cow would require 334 cu ft of storage and treatment volume for 6 months of operation between sludge removals. An aeration tank, 134 cu ft in volume, was operated at 95 deg F. The estimated size for 70 deg F operation was 200 cu ft. Experiments support Webster's value for sizing primary sedimentation tanks of 200 cu ft per cow for biannual sludge removal. Test results show the volume of trickling filter required per cow to meet specific temperatures and effluent qualities. Experiments suggest a sedimentation tank volume of about 114 cu ft per cow instead of the 248 cu ft actually used. Therefore, a trickling filter system would require from 346 to 391 cu ft of tanks per cow to produce an effluent BOD of 200 ppm.

POLLUTION OF WATERWAYS IN THE ELLIOT LAKE AREA, ONTARIO,
Western Ontario Univ. London, Ontario, Canada.
Richard P. W. McCutcheon.
Ontario Geogr, No 2, pp 25-33, 1968. 9 p, 1 fig, 5 ref.

Descriptors: *Water pollution, *Mine wastes, *Radioactive wastes, *Municipal wastes, Aquatic algae, Uranium radioisotopes, Radium radioisotopes.
Identifiers: Elliot Lake, Ontario.

Rapid development of uranium mining in the Elliot Lake area, Ontario, caused widespread radiological and sewage pollution of the Serpent River system. The widely used acid leaching process of uranium ore treatment produces large amounts of waste, both solid and liquid. For each ton of ore, nearly 1 ton of tailings and at least 2 tons and as much as 5 tons of water, acids, and neutralizers are produced. Not all the uranium, and none of the Radium-226, is extracted from the ore, so the tailings piles contribute some radioactivity to water passing through them. Some lakes and streams contain more than the safe amount of radium. Leaks in the refining systems also contribute pollution. All sewage is treated, but lake and stream pollution by increased oxygen demand and increase of nutrients is common and has made one former swimming area obnoxious. No fish can live in Angel and Horne Lakes, and algae are present in excessive amounts. (Knapp-USGS)

A TEST OF FLUSHING PROCEDURES TO CONTROL SALT-WATER INTRUSION AT THE W P FRANKLIN DAM, NEAR FT MYERS, FLORIDA,
U S Geological Survey.
Durward H. Boggess
U S Geol Surv open-file rep, 20 p, 1968. 8 fig, 3 tab, 1 ref.

Descriptors: *Encroachment, *Saline water, *Gate control, *Locks, *Flow control, Navigation, Florida, Boating, Recreation.
Identifiers: Fort Myers (Florida), Lockage, Flushing.

A test was made of procedures to control salt water intrusion during lockage of boats at W P Franklin Dam near Ft Myers, Fla. Near the end of the dry season, in May 1967, the chloride content of river water about 3/4 mile upstream from the lock was about 500 mg/1. In early Mar 1968, the chloride content was about 250 mg/1. Proposed tests included flushing the lock chamber by partial opening of the downstream gate and full opening of the upstream gates prior to lockages, scheduling lockages instead of performing them on demand, and flushing during lockages. A test of flushing before lockages was performed. Salt water was flushed from the lock chamber with gate openings of 4,6, and 8 ft. An opening of 8 ft or more appears preferable because of the smaller volume of water required and less discharge time involved. It is questionable whether sufficient quantities of water will be available for flushing. For example, assuming that the volume of water needed is about 340 acre ft per day (170 cfs), then more than 10,000 acre ft would be required for a 30 day period. For 68 consecutive days between Mar and June 1967, no water other than lockage and leakage was discharged, and for 77 consecutive days discharge was less than 170 cfs. This long period of low flow may represent near extreme conditions, but the availability of water required for flushing should be assured if these procedures are to be adopted. (Knapp-USGS)
W69-01168

CHEMICAL QUALITY OF WATERS OF BROWARD COUNTY, FLORIDA,
U S Geol Surv.
Rodney G. Grantham, and C. B. Sherwood.
Florida Div of Geol Rep of Invest No 51, 52 p, 1968. 16 fig, 3 tab, 18 ref.

Descriptors: *Chemical properties, *Florida, *Aquifer characteristics, Surface-groundwater relationships, Water pollution, Water quality.
Identifiers: *Broward County, Herbicide pollution, Canal water.

Results of a water resources study which emphasizes the chemical quality of waters in Broward County, Florida, are presented. The water is calcium bicarbonate and ranges from hard to very hard, and from neutral to slightly alkaline. Most of the water used in the County is obtained from the Biscayne aquifer, recharged by local rainfall and by water that infiltrates from the canals. The chemical quality in the interrelated surface and groundwater system is generally good. The Floridan aquifer yields brackish water by artesian flow; sewage is disposed in the aquifer at one location. Chemical weed killers applied on the land, as well as detergents, have been detected in the groundwater, indicating movement of waste through the ground. The chemical quality of surface water varies seasonally. The mineral content of canal water does not exceed 550 ppm. Continued monitoring of saltwater intrusion and waste disposal effects is necessary to help prevent future contamination. (Llaverias-USGS)

06. WATER RESOURCES PLANNING

6A. Techniques OF Planning

MANAGEMENT OF HYDROLOGIC SYSTEMS FOR WATER QUALITY CONTROL,
California Univ., Berkeley.
Philip C. Woods.
Water Resource Center, San Eng Res Lab, Contrib 121, June 1967. 121 p, 39 fig, 4 tab, 56 ref, append. OWRR Project A-004-Cal.

Descriptors: *Water quality, *Water management, Hydrology, Irrigation, *Irrigation practices, Simulation, Irrigation O and M, Groundwater flow, Computer programming, Ground water, Salinity, Salts, Mathematical analysis, Control, Water pollution, Bibliographies, California, *Water quality control, Mathematical models.
Identifiers: *Hydrologic models, Sacramento River, Calif.

By a series of mathematical models and digital computer techniques an approach was made to predicting the water quality response of hydrologic systems to changes in irrigation practice. The results obtained by simulating the Sacramento River System were compared to the quality response of the prototype. The potentialities of simulation in systems management were illustrated using the 'X' Hydrologic System. Its sensitivity to incorrect selection of parameter values was examined, as were the system changes that could be induced by altering parameters which are subject to management decisions. From the results it can be expected that a simulation approach will lead to the development of dependable optimizing techniques, the ultimate goal of water quality management. (McGauhey-Calif)

MANAGEMENT MODELS FOR WATER RESOURCE SYSTEMS,
Cornell Univ., Ithaca, N. Y.
Daniel P. Loucks.
Water Resour Center, Tech Rep 1, June 1967. 130 p, 12 fig, 8 tab, 246 ref, 7 append. OWRR Project A-002-NY.

Descriptors: *Systems analysis, *Water management (Applied), Reservoir operation, Water quality, Flow control, Linear programming, Decision making, *Water resources, Policy matters, Mathematical models.

Analytical methods are presented to assist in the establishment of policies for managing developed river systems. Both deterministic and stochastic linear programming models are structured for determining reservoir releases and allocations of water to each flow and stock use that meet some management objective. Three possible objectives are discussed and incorporated into the models, namely maximization of total expected net losses, and minimization of total expected deviation from

each use or expected allocation. This latter is suggested if no economic benefit-loss data are available. Two deterministic linear programming models for water quality management are discussed. These models indicate the minimum cost required to maintain particular dissolved oxygen standards within the system and increase in costs resulting from any social, legal or administrative constraints. Extensions of these models and some economic implications are presented in the appendix.

PROBLEM OF ALTERNATIVES IN WATER RESOURCE MANAGEMENT,
Resources for the Future, Washington, D. C.
Robert K. Davis.
The Range of Choice in Water Management, 1968, Chap 1, p 3-10, 2 ref.

Descriptors: Water resource management, Federal project planning, Evaluation, Project planning, Institutional constraints, *Political aspects, Administrative decisions, Assessments, Intangible benefits, Social values, *Optimum development plans, Jurisdiction.
Identifiers: Operating responsibility, *Assessment of alternatives, Technology.

Several important questions should be asked in considering the probable implementation of alternatives: (1) How broad an array of alternatives are technologically possible; (2) What analytic problems do they present; (3) What institutional or procedural forms might be obstacles to certain alternatives; (4) How can planners be encouraged to explore the range of choice. The comparison of alternatives, including their measurable costs and returns, as well as their difficult-to-measure consequences, provides the best basis we have for intelligent consideration of important intangible values. However, this practice of comparison has not been put into effect. One reason is the technical difficulty of presenting all the alternatives. Five factors contribute to this problem: (1) various combinations of variables make the number of alternatives to be considered enormous, (2) deficient physical and biological knowledge, (3) inability to competently assess economic and social factors, (4) changing technology, (5) difficulty of assessing intangible benefits and costs. These factors make it difficult to define an optimum solution in an objective manner. Several features of the institutional environment also inhibit and complicate the task of exploring and evaluating alternatives. These are (1) limited jurisdiction of water agencies, (2) political bias in favor of certain alternatives, and (3) an agency's adaptability is limited by past perceptions and solution of problems. (Gargola-Chicago)

THE OPTIMIZATION OF LARGE SCALE WATER RESOURCE SYSTEMS: OPERATIONAL ASPECTS, PART 1: CONCEPTUAL FRAMEWORK,
California Univ., Los Angeles.
Nathan Buras.
University of California, Sept 1965, 34 p, 8 fig, 8 ref.

Descriptors: Computer programs, Reservoirs, Data processing, *Dynamic programming, Linear programming, Water utilization, Optimum development plans, Hydrological data, *Mathematical models, Hydroelectric power, Water supply, Dimensional analysis.
Identifiers: Trinity Reservoir, Folsom Reservoir, Oroville Reservoir, Shasta Reservoir, Optimal operating procedure, California.

A water resource system consisting of four reservoirs was analyzed with respect to its operation in an integrated manner. The reservoirs release water for irrigation and municipal and industrial use, and for the generation of hydro-electric power. It is required to (1) determine the maximum amount of firm water and firm power which may be produced by the system, and (2) determine an optimal operating procedure for the satisfaction of the target outputs determined by (1) above. Only part (1) was discussed. The optimization of the entire system using dynamic programming was found to be unfeasible due to the large dimensionality of the problem: at least one dimension for each reservoir of subsystem. Consequently, the decomposition principle was applied using a combination of dynamic programming (for the optimization of each subsystem) and linear programming (for the optimization of the master program). Hydrological data covering ten consecutive years and including lowest inflows on record were supplied so that ten different values of firm water and firm power may be calculated. On the basis of these results, the target outputs for the system as a whole, in terms of firm water and firm power, may be determined. (Gargola-Chicago)

MATHEMATICAL ASSESSMENT OF SYNTHETIC HYDROLOGY,
U. S. Geological Survey, Washington, D. C.
N. C. Matalas.
Water Resources Res, Vol 3, No 4, pp 937-945, 1967. 9 p, 12 ref.

Descriptors: *Synthetic hydrology, Markov processes, Mathematical models, Stochastic processes, Statistical methods.

To generate multivariate synthetic sequences that will resemble multivariate historic sequences in terms of means, standard deviations, skewnesses, lag-one serial correlation, and lag-zero cross-correlations, a multivariate, weakly stationary process is used. Techniques of regionalization and maximum likelihood estimates may be used to minimize the biases associated with the estimates of the parameters that characterize the historic sequences. (Author)

SYNTHETIC HYDROLOGY BASED ON REGIONAL STATISTICAL PARAMETERS,
U. S. Geological Survey, Washington, D. C.
M. A. Benson, and N. C. Matalas.
Water Resources Res, Vol 3, No 4, pp 931-935, 1967. 5 p, 3 tab, 8 ref.

Descriptors: *Synthetic hydrology, *Regression analysis, Stochastic processes, Mathematical models, Sampling, Statistical methods.

The subject of synthetic hydrology, the generation of a long series of hydrologic events by use of the statistical parameters based on a short sample, is reviewed. A method is proposed to correct deficiences caused by large original sampling errors and the lack of a way to generate series for ungaged locations. All the longer streamflow records in a region are used and the relations between the variables are determined by standard multiple regression methods. The relations are based essentially on a random sampling of the variables, so they are applicable to all basins, gaged or ungaged, in a studied region' their use reduces short-sample error. Relations defining statistical parameters for the Potomac basin are presented as an example of the method. (Knapp-USGS)

BROAD HORIZONS IN WATER RESOURCE PLANNING AND INVESTMENT,
Resources for the Future, Washington, D. C.
Charles W. Howe.
Water Resources Research, Vol 2, No 4, pp 843-847, Fourth Quarter 1966. 1 tab, 7 ref.

Descriptors: *Planning, Water resources, Investment, Governments, Benefit-cost ratio, Costs, Harbors.
Identifiers: Public policy, Private enterprise.

In spite of the vastly expanded knowledge and computational abilities available in the planning of water resource systems, the scope of most planning efforts remains too narrow. It is argued that planning efforts must be broadened in three ways: (1) geographically, to take into account not only hydrological interdependencies but the wider range of market and financial relationships; (2) between public and private sectors to assure that public investments yield sufficiently high returns; (3) to encompass all relevant alternatives, both technological and institutional, for attaining the objectives of development. Examples of the costs resulting from the failure to use sufficiently broad horizons in planning are provided for several water resource problems. (Seneca-Rutgers)

CAN WE SOLVE OUR WATER PROBLEMS,
Resources for the Future, Washington, D. C.
Irving K. Fox.
Water Resources Research, Vol 2, No 4, pp 617-623, Fourth Quarter 1966. 7 ref.

Descriptors: Costs, Return, *Administration, Irrigation, *Water resources, *Legislation, *Water supply, Water quality, Water Resources Planning Act, Governments.
Identifiers: Public policy, Private enterprise.

Water problems may be thought of as occurring in three major areas. One problem area is the urgent need of maintaining a continuously advancing science and technology, especially in water quality management. Another problem area is that of balancing costs and returns from water development and use. It has proven to be uncommonly difficult to achieve a consensus on costs and returns, which, in turn, has often made it difficult to proceed with water programs. A third problem area stems from the inadequacy of water management institutions. Laws, policies, and organizational arrangements have not kept abreast of the requirements of a rising demand and an advanced technology. In recent years we have greatly improved our ability to deal with these problems. Recent action by both government and private organizations reflect a determination to solve the problems which remain. Three key issues now merit priority attention: (1) finding better ways of providing officials and the public with authoritative information; (2) establishing institutions capable of operating complex water management programs; (3) modifying public policy to improve the performance of private enterprise. ON RESERVOIR SITE PRESERVATION POLICY,
Resources for the Future, Washington, D C.
Allen V. Kneese.
Water Resources Research, Vol 2, No 3, pp 607-614, Third Quarter 1966 3 ref.

Descriptors: *Reservoir sites, *Pre-impoundment, Costs, *Value, Market value, Property values, Economic efficiency, Legislation, Governments, *Regulation, Taxes, *Zoning, Planning.
Identifiers: *Reservoir site preservation policy, Opportunity costs, Equity, Government acquisition, Development rights.

LIBRARY U. OF I. URBANA - CHAMPAIGN

It is not obvious that reservoir site preservation policies should be adopted. Before such a policy is implemented, consideration should be given to the value of the sites for alternative uses. In some cases the free market registers these opportunity costs accurately. However, under certain circumstances the free market prices do not reflect these costs. For example, the market price of land may be bid up in anticipation of its purchase as a reservoir site. Public action to preserve reservoir sites could depend upon one of three governmental powers: the power to regulate the use of property, the power to acquire property and the power to tax. There are many methods of site preservation. These methods can be evaluated in terms of the following criteria: (1) economic efficiency, (2) equity, (3) public outlay required, (4) changes in the law required. Various methods such as zoning, acquisition and compensable regulations are analyzed on the basis of these criteria. The analysis suggests the compensable regulations may be the most basic device for the preservation of reservoir sites, although other devices might be more effective in particular situations. AN OPTIMIZATION METHOD FOR BRANCHING MULTISTAGE WATER RESOURCE SYSTEMS,
Texas A and M Univ., College Station and Texas Univ., Austin.
W. L. Meier, Jr., and C. S. Beightler.
Water Resources Research, Vol 3, No 3, pp 645-652, Third Quarter 1967. 6 fig, 11 ref.

Descriptors: *Optimization, *Dynamic programming, Planning, River systems, River basins, Reservoir, Water resources development.
Identifiers: *Nonserial systems, *Serial systems, *Multi-stage process, State, Decision, Stage, Return, Transition, Cut state.

Several optimization procedures have been proposed for the analysis of complex water resource planning problems. One of these techniques, dynamic programming, has been limited in its applicability to river basin systems because these systems are nonserial and dynamic programming is by nature a serial procedure. Recently developed methods are discussed and illustrated with example problems for decomposing the nonserial river basin system into equivalent serial systems amenable to analysis by the dynamic programming method. TOWARD COMPREHENSIVE WATER RESOURCES MANAGEMENT IN THE CALUMET UNION DRAINAGE SYSTEM.
Northeastern Illinois Planning Commission, Chicago, Ill.

Report Northeastern Illinois Planning Commission, Chicago, Ill, 1966, 16 p, 3 fig, 1 tab, 6 ref.

Descriptors: Local governments, Water resources management, *Interagency cooperation, *Project planning, Project purposes, Formulation, Urbanization, Social needs, State governments, *Flood control, Multipurpose projects, Community development, Low flow augmentation.
Identifiers: Calumet Union Drainage System.

In the Calumet Union Drainage System, flooding is a significant problem. It is of short duration and occurs at infrequent intervals. This general situation is reviewed in terms of the blight it has created. This area cannot afford the luxury of a single-purpose flood control project where inadequate flow, urban ugliness, and slum housing exist and are associated with the flood problem. Suggested improvements by the Army Corps of Engineers, U. S. Geological Survey, various State agencies, the Metropolitan Sanitary District of Greater Chicago, and the Illinois Division of Waterways are given. The Northeastern Illinois Planning Commission outlines its own plan. Easy accessibility to surrounding municipalities demand that the potential recreational value of the site be utilized. A recreational lake with adjacent field for storage of flood waters is proposed. Housing or a community college could be built by the lake. Organization for this plan could be handled through the Urban Renewal Board. Steps following that are defined and agencies that would be involved in any development of the area are outlined. (Gargola-Chicago)

NORTHEASTERN ILLINOIS WATER RESOURCE ORGANIZATION INQUIRY.
Illinois Department of Business and Economic Development, Springfield, Illinois.

Report, Northeastern Illinois Planning Commission, Chicago, Feb 1968. 11 pp.

Descriptors: Decision making, Adoption of practices, Water resource development, Administrative procedure, Community development, State governments, Administrative agencies, Project planning, *Interagency cooperation, *Regional planning, *Future planning, Short term planning, Long term planning, Management, Institutional constraints.
Identifiers: Northeastern Illinois.

To consider possible methods of organizing for coordinated water resources planning and development in Northeastern Illinois four groups were called together. Consultants, suburban managers, technical advisors, and a planning commission subcommittee, reviewed (1) organizational needs, functions and programs, (2) structural form, and (3) enforcement factors. There was general agreement on the need to begin with coordination and mutual adjustment of existing programs. Short and long range planning must be provided in order to meet immediate critical requirements and prepare for future development. A form of regional management was generally approved to be the best system for water resource management planning as well as operational coordination. The Planning Commission should continue to play a major role in water resource planning and the coordination of this with other aspects of comprehensive planning for the region. Subcommittee findings and recommendations are summarized with suggestions for meeting critical immediate requirements. (Gargola-Chicago)

PRODUCTION TECHNOLOGY IMPERFECT COMPETITION, AND THE THEORY OF LOCATION: A THEORETICAL APPROACH,
Wisconsin Univ., Madison.
Gilbert A. Churchill, Jr.
Southern Economic Journal, Vol 34, No 1, pp 86-100, July 1967. 2 fig.

Descriptors: *Industrial plants, *Sites, Costs, Initial costs, Competition, Demand.
Identifiers: *Facility location analysis, *Location theory, *Production technology, *Imperfect competition, Plant size.

Facility location analysis is used to determine the best location for a single firm. The author attempts to extend the theory of facility location in several ways: (1) by introducing more realistic transport costs; (2) by including imperfectly competitive factor markets within a location model; (3) by explicitly incorporating plant size within a spatial model; (4) by treating production technology directly, thereby allowing factor substitutions with output changes at each site; and (5) by introducing monopolistic competition in the product market which is attributable to product differences rather than to competitor locations. The extensions are demonstrated with a theoretical 'point' location model. The model is developed from the vantage point of a single firm faced with the location decision. Hypothetical functions are used to develop the model. It is assumed that the firm attempt to maximize profits and this single consideration guides the determination of the level at which output should be planned as well as where the product should be produced. Within his spatial model, the author attempts to integrate stock-flow production theory, transportation economics and existing location theory. (Seneca-Rutgers)

INDIVIDUAL PREFERENCE INTRANSITIVITY,
Southampton Coll., Long Island, N. Y.
Arnold A. Weinstein.
The Southern Economic Journal, Vol 34, No 3, pp 335-343, January 1968. 2 fig.

Descriptors: Psychological aspects, Decision making.
Identifiers: Choice, *Preference patterns, *Intransitivity, Indifference curve analysis, Bands of indecision, Rationality.

The causes of observed individual intransitivity are divided into five categories: (1) true irrationality of a clinical nature as; (a) the situation where the thought of one alternative affects the desirability of another alternative; (b) conflict between the superego and the id or ego; (c) the desocialized or unsocialized individual; and (d) role conflict; (2) observed intransitivity caused by; (a) the lack of communications between the experimenter and subject; (b) the subject's changing tastes; (c) boredom with the experiment; (d) playing a game with the experiment; or (e) the experimenter asking the wrong question; (3) observed intransitivity caused by non-allowance for indifference; (4) true intransitivity caused by man's imperfect sensitivity to his environment or himself and (5) rational intransitivity due to the high cost of holding a preference ordering. If verified, the last cause leads to a modification of indifference curve analysis which would significantly affect the derivation of Pareto optimality by market conditions. A conceptual tool entitled 'Bands of Indecision' is developed to demonstrate this condition. (Seneca-Rutgers)

SOME BOUNDS UPON THE PARETO OPTIMALITY OF GROUP BEHAVIOR,
Australian National Univ., and Princeton Univ., New Jersey.
Clem Tisdell.
Kyklos, Vol XIX, No 1, pp 81-104, First Quarter 1966.

Descriptors: *Welfare, *Model studies.
Identifiers: Conflict of interest, *Pareto optimality, *Group behavior, Maximization, *Interdependence, *Game theory, Uncertainty.

This article puts special emphasis upon those obstacles to the Pareto optimality of group behavior which arise from the imperfection of man's knowledge. Bounds upon Pareto optimal behavior are discussed for three limiting societies: (1) a society in which all members are independent, (2) one in which only one-way dependencies can arise, and (3) one in which all members are completely interdependent. Insights drawn from these cases can be used in discussing non-limiting ones. Account is then taken of the fact that few groups exist in isolation and some formal conditions, which may often make it impossible for a group to achieve a Pareto optimality, are stated. It is shown that Pareto optimality of group behavior is limited by factors such as individual's imperfect knowledge of their own preferences, barriers to discovering the preferences of others, limitations imposed by the good faith of parties to agreement, the intrusion of emotional factors, e.g., in bargaining false notions

by individuals of their own predictive powers, and by other uncertainties about possible acts and the relationship between acts and outcomes. (Seneca-Rutgers)

A NOTE ON CONSUMER BEHAVIOR IN AN URBAN HIERARCHY,
Canterbury Univ, New Zealand and National Univ, Australia.
R. J. Johnston, and Peter J. Rimmer.
Journ of Regional Science, Vol 7, No 2, pp 161-166, Winter 1967. 2 fig, 2 tab, 3 ref.

Descriptors: *Demand, *Behavior, *Cities.
Identifiers: *Consumer behavior, Central place theory, Rationality, Australia.

The structural concepts of central place theory, including the idea of hierarchy, are based on a number of assumptions concerning consumer behavior. All of the assumptions imply rational human actions and complete knowledge. This article makes an investigation into the validity of these assumptions, using a series of small towns in Victoria, Australia as its study area. A sample of residents were questioned on their normal shopping habits. The tabulated results indicate that this behavior does not generally accord with the assumptions of central place theory. Part of the explanation of this lies in the extreme primacy of Melbourne within Victoria so further research is necessary within other urban systems. (Seneca-Rutgers)

THE VALUE OF A TROUT STREAM FISHERY,
Utah State Univ, Logan.
Archie A. Dyer.
Final Rep Utah Water Resour Res, Dec 1967. 49 p, 5 fig, 12 tab, 18 ref, append. OWRR Project B-008-UTAH.

Descriptors: *Recreation, Competing uses, Value, Cost benefit analysis, Social values, Economic prediction, Regression analysis, Utah, Income, Age, *Trout, Sport fish, *Fisheries, Fishing.

The data analysis indicated that travel distance, user age, and user income level are important determinants of use of trout streams. These variables were incorporated into regression analysis to develop a use-prediction model. This model was used to determine predicted use levels of sample streams. The predicted use levels combined with travel costs and expenditures on new fishing equipment were used to derive a statistical estimate of the demand schedules for the sample streams. These statistical demand curves were subjected to consumer surplus procedures to determine the values of the sample streams.

NEW HORIZONS IN WATER RESOURCES ADMINISTRATION,
Resources for the Future.
Irving K. Fox.
Public Administration Review, Vol. 25, No. 1, 1965, p 61-69, 29 ref.

Descriptors: Resource development, Interest rate, Indirect benefits, Intangible benefits, Systems analysis, *Interagency cooperation, *Decision-making, Water resource development, Project planning, Political aspects, Administrative decisions, Administrative agencies, *Economic evaluation, Optimum development plans, Regional analysis, *Welfare economics.
Identifiers: Projection of demand, Market process.

The significant developments in water resource activities are reviewed for the past fifteen years. The search for efficiency is explored, with emphasis on the applicability of welfare economic theory. The major problems in evaluating water resource investments--secondary benefits, range of alternatives, projections of demand, and consideration of variables--are discussed. Three measures: (1) adoption of policies which rely on market-like processes; (2) restructuring policy patterns, agency authority and responsibility; and, (3) making greater use of countervailing influences are suggested for achieving greater efficiency in development. It is concluded that research in policy-institutional structure is far behind technical aspects of water resource development, and must be improved to better implement future planning. WATER FOR TEXAS.
Texas A and M Univ., College Station.

Proc 11th Annu Conf, Water for Texas, Nov 21-22, 1966. 66 p, 10 fig, 3 tab, 57 ref.

Descriptors: *Water resources, *Water resources development, Weather modification, Planning, Evaporation control, Estuaries, Recreation, Water management (Applied), Fish establishment, Water quality, Water reuse, *Water utilization, Water development, Water law, Pollution abatement, Texas, Bibliographies.
Identifiers: *Water use, Water plans.

The Proceedings of the 11th Annual Water for Texas Conference held at Texas A and M University, College Station, Tex, Nov 21-22, 1966, include 13 papers developing the theme Challenges of the Present. Developing Total Resource, Estuarine Problems, and Recreational Impact are subthemes representing water resource problem areas which need immediate attention if Texas is to meet the challenge of effective utilization of water resources. Concepts set forth by recognized authorities on water resource planning will be of value to water planners and researchers as Texas water problems are considered in the immediate future.

SOCIOLOGICAL FACTORS IN WATERSHED DEVELOPMENT,
Mississippi State Univ., State College.
Kenneth P. Wilkinson, and Lucy W. Cole.
Water Resources Res Inst Rep, Jul 1967. 48 p, 127 ref. OWRR Project A015-Miss.

Descriptors: *Project planning, Water resources development, *Community development, Economics, *Social aspects, Social impact, Watersheds, Social participation, Sociology, Social sciences, Small watersheds, Watershed management.
Identifiers: Water resources management, Social acceptance.

The technical process of watershed project action is often hindered by social problems. Increasing awareness by program administrators has resulted in a search for scientific approaches to citizen involvement in watershed planning. Sociological resources relevant to water-related problems have rarely been applied in other than superficial ways. A strategy is proposed by which sociological research can be more effectively oriented to problems experienced by water management professionals. A sociological field theory is outlined as foundation for the needed program of research. A review of social science literature concerning watershed action reveals a variety of findings and hypotheses for research, but little sustained integration of theory with findings. Analysis of data on watershed needs and projects in Mississippi as related to demographic and social-organizational characteristics of communities yields findings which are suggestive of a relationship. The general conclusion reached is that rigorous efforts in theoretical and operational development will be necessary to assess the influence of community forces in watershed development.

AN ACT CREATING THE WATER RESOURCES BOARD, DEFINING ITS POWERS AND DUTIES.

Illinois Laws 1967, Act 1191.

Descriptors: *Illinois, United States, Legislation, *Water Resources Development, Universities, Financing, Water utilization, Land resources, Projects, Navigation, Flood control, Rivers, Bodies of water, Watersheds (Basins), Local government.
Identifiers: Water Resources Board, Resources Development Act.

The composition and financing for the Water Resources Board is described. The Board's functions are: to inform citizens of the condition of water and related land resources; to advise the Governor on legislation; to coordinate activities of state agencies; to examine the effects of state programs; to review proposed projects to determine priorities; to act for the state on projects for the improvement of navigation, flood control or for purposes of the United States involving rivers, waters or watersheds; to administer financial assistance to local governments for water resources planning; to establish and supervise regional water resources management commissions; to receive funds; and to administer the Resources Development Act. DESIRABLE FEATURES OF WATER RIGHTS LAWS,
Nebraska Dept of Water Resources, Lincoln, Nebr.
Dan S. Jones.
J of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 89, No IR4, part 1, pp 1-6, Dec 1963.

Descriptors: Irrigation, *Water rights, Water distribution (Applied), Water law, Preferences (Water rights), Appropriation, Prior appropriation, Surface waters, Stream gages, Groundwater, *Nebraska, Riparian rights, Competing uses, *Legal aspects, Federal-state water rights conflicts, Water allocation (Policy).

The coexistence of the riparian and appropriation doctrines creates uncertainty and makes orderly administration of the law difficult. The law should declare that all waters of the state are public and are subject to appropriation and use as provided by law. All uses of water, except for ordinary household purposes, should be subject to control by one central state administrative agency having authority to police the streams, to grant water rights, and to cancel such rights when the appropriator ceases to use the water for the purpose for which the appropriation was granted. The decisions of the administrative agency should be appealable directly to the Supreme Court. The law

LIBRARY U. OF I. URBANA - ILLINOIS

should indicate certain preferential uses of water and the use of water for such a purpose should be permitted provided that a prior appropriator for an inferior purpose is adequately compensated for any interference resulting therefrom. The water rights law should apply equally to all who desire to use the public waters, including agencies of the United States. (R. Smith-Fla)
W69-00760

AN ACT CONCERNING LONG RANGE WATER RESOURCES PLANNING.
Connecticut Public Act No 477 (1967).

Descriptors: *Planning, *Connecticut, Long-term planning, Project planning, Administrative agencies, Budgeting, Coordination, Legislation, Water resources development, Water allocation (Policy), Water utilizations, State governments, Local governments, Water policy, Administration, Water supply, Water resources.

The act provides for the formulation of a long-range statewide plan for the management of the water resources of the state. The Water Resources Commission, the State Department of Health, the State Board of Fisheries and Game, and the Connecticut Development Commission are responsible for preparing the plan. They are to design a unified planning program, coordinate regional water and sewer plans and assist local planning. The act sets up objectives and guidelines for the plan and provides for its submission to the general assembly. (Horner-Fla)
W69-00767

DELAWARE RIVER BASIN COMMISSION.
18 CFR Ch 3, Sec 401.0-401.52 (1968).

Descriptors: *Delaware, *Delaware River Basin Commission, Conservation, Legislation, *Water resources, River basin development, Impoundments, Ground water, Sewage treatment, Surface water, Dredging, Bridges, Projects, Administrative agencies.
Identifiers: *Comprehensive Plan, *Water Resources Program, Delaware River Basin Compact.

The basic purposes and general methods of operation of the Delaware River Basin Commission are described. Subpart A governs the submission, consideration, and inclusion of all projects, public and private, into the Comprehensive Plan. This Plan includes all projects which the Commission decides are required for the development, planning, conservation, use, management and control of the water resources of the Delaware Basin. Subpart B governs the submission, consideration, and inclusion of these projects into the Water Resources Program which is the annual presentation of the quantity and quality of water resource needs of the area to be served during the next six years or shorter period balanced by existing and proposed projects required to satisfy such needs and a statement of the projects to be undertaken during this period. Subpart C governs the submission and review of projects under Section 3.8 of the Delaware River Basin Compact. Certain projects are designated as having no substantial effect on the water resources of the Basin and are thus not required to be submitted for review. Subpart D defines terms used in this act. (Childs-Fla)
W69-00774

WATER RESOURCES COUNCIL.

18 CFR Ch 6, part 701 and 703 (1968).

Descriptors: *United States, Legislation, *Water Resources Planning Act, *Conservation, Water resources, *River basins, Projects, Navigation, Federal Power Act, Land resources, Grants, States, Irrigation, River Basin Commission.
Identifiers: *Water Resources Council, Secretary of Agriculture.

The Water Resources Council is to carry out the purposes in the Water Resources Planning Act. These purposes are conservation, development, and utilization of water and related land resources. The Council's functions are: (1) to assess the adequacy of water supplies; (2) to study the relation of regional and river basin plans to the requirements of larger regions; (3) to appraise the adequacy of present means of implementing water and related land resources policies; (4) to establish standards for regional or river basin plans; and, (5) to coordinate federal agencies in river basin planning. The Act describes the composition and operating procedures of the Council and provides the methods of administration of grants to states to encourage: (1) state participation in federal-state comprehensive water and related land resources planning; (2) state preparation of plans for use of these resources; (3) state training of personnel to develop planning capability. The Act also provides for compliance with the Civil Rights Act. (Childs-Fla)
W69-00777

AN ACT REORGANIZING AND RENAMING THE RHODE ISLAND WATER RESOURCES COORDINATING BOARD, AND EXTENDING ITS POWERS AND DUTIES.

Rhode Island Laws 1967, Ch 156. 18 p.

Descriptors: *Rhode Island, Legislation, *Administrative agencies, Administration, *Water resources development, Water supply, Regulation, Projects, Reservoirs, Water sources, Cities, *Water permits.

Chapter 46-15 of the general laws is amended in its entirety. A nine-member water resources board is created. The board is empowered to: (1) acquire property and interests therein for reservoirs and facilities to treat and distribute waters contained in such reservoirs; (2) construct reservoirs and facilities; (3) formulate and maintain a long-range guide plan for development of water sources; (4) to provide for cooperation in such development; and (5) to make loans to publicly owned water supply agencies. Board approval is required for any additon to or extension of the facilities of municipal water agencies, or diversion of water to another state. Upon an application to the board for a new or additional water supply or source thereof, the board may require of authorize the applicant to make provision for the supply of, and to supply water to, any other area of the state. Board personnel is provided for an authorized to enter any lands to make surveys, and examine books and records. The board is to take the place of the old water resources coordinating board. Board-owned and authorized property is exempted from taxation. The board is authorized to make general rules and regulations. (R. F. Williams-Fla)
W69-00780

ESTUARIES - INVENTORY - STUDY, SENATE REPORT NO 1419.
U S Code Cong and Admin News, Vol 1968, No 10, pp 3658-3679, Sept 20, 1968. 22 p.

Descriptors: *Legislation, *Federal government, Bays, Administrative agencies, *Estuaries, Rivers, Aquatic habitats, Currents (Water), Grants, *Estuarine environment, Gulfs, Inlets (Waterways), Intertidal areas, Saline water fish, Sea water, Wildlife conservation.

The Senate Committee on Commerce reported favorably on a proposed bill to authorize the Secretary of Interior, in cooperation with the states, to conduct an inventory and study of the Nation's estuaries and their natural resources. An estuary is a semienclosed coastal body of water having a free connection with the open sea and within which the sea water is measurably diluted with fresh water derived from land drainage. The purpose of this bill is to provide a means for considering the need to protect, conserve, and restore these estuaries in a manner that adequately and reasonably maintains a balance between the national need for such protection in the interest of conserving the natural resources and natural beauty and the need to develop these estuaries to further the growth and development of the Nation. The result of this study would be due Jan 30, 1970, at a cost of $500,000. (R. H. Watson-Fla)

THE ECONOMIC DYNAMICS OF RIVER BASIN DEVELOPMENT,
Idaho Univ., Moscow, Agr Econ Dept.
William E. Folz.
Law and Contemporary Problems, Vol 22, No 2, pp 205-220, Spring 1957. 34 ref.

Descriptors: *River basin development, Economic impact, Water resources development, Columbia river basin, Interstate rivers, *Economic efficiency, Irrigation programs, Water demand, Hydroelectric power, Legislation, Leontief models, Input-output analysis.

An inquiry into the influence of river basin development on economic expansion can, perhaps, best be initiated by a determination of the types of resources that are likely to be created or enhanced by such development and then an evaluation of these resources as dynamic economic prime movers. This article suggests that irrigated agriculture is probably the most certain of the products of river basin development to induce economic expansion, electric power rates very high as a prime mover to economic expansion, and other by-products of river basin devepment, such as navigation, flood control, and recreation, have only negligible potential for inducing economic expansion. (R. Smith-Fla)

GEOLOGIC FACTORS IN COMMUNITY DEVELOPMENT AT NAPERVILLE, ILLINOIS,
Illinois State Geological Survey.
James E. Hackett.
Environmental Geology Notes, Number 22, June 1968, 16 pp, 4 fig, 11 ref.

Descriptors: Bed rock, Dolmite, Non structural alternatives, Flooding, *Impaired water quality, *Geologic investigations, *Water supply, Ground water, Low flow, Stream flow, Drainage basin.
Identifiers: Naperville (Ill), West Branch Dupage River, Spring brook.

Expansion of the city by incorporation of tracts of land for subdivision and for industrial and commercial use has resulted in expansion of community service facilities for water, sewerage disposal, and storm water drainage control. Because Naperville is surrounded by unurbanized land it will continue to grow, necessitating comprehensive plans to meet future development needs. Information on geology, ground water resources, stream flow, and extent of flooding was gathered and related to various aspects of community development. Certain significant problems become evident: construction in areas subject to flooding and areas of poor drainage; impaired water quality due to the fact that Naperville is at the downstream end of the drainage basin in the county; legal and physical hindrances prevent other sources from being used, water supply must be had from underground sources. Considering these factors recommendations for future planning policies are outlined. (Gargola-Chicago)

INTERGOVERNMENTAL RESPONSIBILITIES FOR WATER SUPPLY AND SEWAGE DISPOSAL IN METROPOLITAN AREAS.

Advisory Comm. on Int. Relations. Report No. A-13, Oct. 1962, 135 p, 5 tab, 72 ref, 2 append.

Descriptors: Economies of scale, Water rates, Political aspects, Water quality control, State jurisdiction, Water allocation, Legislation, *In-

teragency cooperation, Water resources management, Municipal water supply, Investment, State governments, Federal project policy, Institutional constraints.
Identifiers: Multipurpose vs. single purpose.

Discusses the problems of urban water quality and quantity, regional variations, and the difficulties of balancing and adjusting varying governmental interests. Local water problems of inadequate investment failure of individual systems, and the fragmentation of this public function are examined in detail. Various metropolitan approaches are given; arguments for a comprehensive plan include the economics of scale, equalization of water and sewer rates, and fewer unwise investments. Considered then are the political realities in relation to these approaches; the difficulties of the multi-purpose approach are discussed in comparison with the easily implemented single-purpose plans. The state's role in urban water planning is reviewed in the areas of allocation, regulation, facilitation and development. Continuing on governmental involvement suggestions for the role of the federal government in quality and quantity control are given. It is decided that the problems of water resource management are more governmental than technical; ten suggestions for future developments, with plans to implement them are then given. In conclusion, models for acts - State Water Resources Planning and Coordination Act, and Control of Urban Water Supply and Sewerage Systems are suggested. (Gargola-Chicago)
W69-00944

WATER MANAGEMENT AND URBAN PLANNING,
Lyle E. Craine.
American Journal of Public Health, Vol 51, No 3, March 1961, p 427-33.

Descriptors: Water resource management, Water supply, Project planning, Coordination, Project policy, Urbanization, Water means, Flood damage control, Water use, *Inter-agency coordination, Local governments, Public health.
Identifiers: Resources for the Future Inc., Water supply-demand, Population growth.

Solution to water problems of the future will demand a closer coordination of urban planning and water development. New requirements for planning coordination will develop: (1) increased emphasis upon intensive water management in certain urbanized areas; (2) changes in water-use patterns demanding multipurpose planning approaches; (3) demand for greater local participation in federal water management; and (4) comprehensive approach to flood problems. These are largely the product of the interaction of two factors: (1) the concentration of demand upon local water resources, and (2) the increasing value which the urbanized public attaches to water amenities. Greater involvement of local government in water management and a greater integration of water development and urban planning will be required. (Gargola-Chicago)

CONTROL OF LAND CONTIGUOUS TO FEDERAL RESERVOIRS,
Kansas State Univ., Manhattan, College of Architecture and Design.
Maurice Lee Miller.
Kansas Engineering Experiment Station, Special Report 51, 1964, 9 p, 1 tab.

Descriptors: *Land development, Reservoirs, Recreation, Public benefits, State governments, Project planning, *Inter-agency cooperation, Acquisition, Financing, Coordination, Legal aspects, Local governments.
Identifiers: Kansas.

Demands are increasing for recreational, residential, commercial, and industrial land uses adjacent to reservoirs. The greatest need to promote good development is adequate land use planning and subdivision control. Although each reservoir situation is different, a generalization can be made that a substantial portion of the waterfront should not be subdivided for residential purposes. Increasing public demand for recreation indicates that a portion of the waterfront and the lake itself should be reserved for these purposes. A summary of reservoir planning activities in sixteen states is given. There is a current trend for state agencies to cooperate more with federal agencies in reservoir pre-construction planning. This tends to promote coordination in providing for adequate land for public access and recreation. Specific agencies in Kansas involved in planning are listed. In summary, twelve major findings are reviewed. (Gargola-Chicago)
W69-00962

WATER SUPPLY AND POLLUTION CONTROL ASPECTS OF URBANIZATION,
Duke University, Department of Civil Engineering.
Edward H. Bryan.
Law and Contemporary Problems, Vol. 11, Oct. 1959, p 176-192, 2 tab, 18 ref.

Descriptors: Water value, Urbanization, Desalinization plants, Water desalting, Oxygen requirements, *Pollution abatement, *Water quality control, Waste water treatment, Water reuse, Industrial use, Water consumption, Recirculated water, Water reuse, *Water resource development, Water demand, Water supply, Waste dilution.
Identifiers: Florida, California.

Civil engineers have not been fulfilling their proper role in areas of urban planning and building technology. The very need to consider both water supply and pollution control as a single subject is illustrative of the new fields in which the civil engineer must work. As a background to discussion of this, the hydrologic cycle, industrial water use, and impairment of water quality is discussed. Our needs for water have sharply increased in the past years and promises to continue to increase in the future. There would be no problem in connection with water resources if wastewater could be economically treated to remove all pollutional characteristics. Discussion of pollutants, distillation, recirculation, desalinization, air pollution, and oxygen demand of water, and their possible significance in management of water quality is given. The problems of urbanization has created many of the water supply problems we now face. There is a great urgency for development of legal tools with good technical consultation in their conception and enforcement. Reorganization of our political boundaries to permit more effective utilization of regional water resources is imperative if we are to have sufficient water resources to meet the increased urbanization of the future. (Gargola-Chicago)

COMPREHENSIVE RIVER BASIN PLANNING: THE ARKANSAS-WHITE-RED BASINS INTER-AGENCY COMMITTEE EXPERIENCE,
Michigan Univ., Institute of Public Administration.
Robert H. Pealy.
University of Michigan, Ann Arbor, 1959, 71 p, 37 ref.

Descriptors: *River basin planning, *Decision making, Project planning, Project purposes, *Institutional constraints, Administration decisions, Legal aspects, Financing, Secondary benefits, Political aspects, State governments, Interagency coordination, Jurisdiction, Inter-agency commission on water resources, Interstate, *River basin commissions.
Identifiers: Arkansas-White-Red River Basin Inter-Agency Committee, Arkansas River, White River, Red River.

The AWRBIAC was formed to prepare a comprehensive plan which was to be fully coordinated among the relevant federal agencies and state governments. The major effort was directed toward getting member agencies to define comprehensive river basin planning, rather than actually preparing a plan. The Legislative history of the AWRBIAC is reviewed and basic organizational and procedural forms defined. State representatives and members from designated federal agencies formed the control group, each member having veto power. This unanimity rule was the source of much difficulty in forming any definite plan. A proviso clause whereby existing structures, projects under construction, projects contemplated for future authorization or construction could not be hindered or delayed as a result of the AWR study was a constraint on the development of an independent program. These obstacles, with difficulties in financing, measurement of secondary benefits determined to a great extent the scope and character of the plan. Although the AWRBIAC agreed that a comprehensive plan is one which is fully coordinated with respect to economics and engineering, they did not succeed in making a plan which satisfied these criteria. An analysis of this failure is the main purpose of the report. (Gargola-Chicago)
W69-00964

DETERMINANTS OF PROPERTY VALUE ON ARTIFICIAL LAKES,
Wisconsin Univ., Department of Agricultural Economics.
Elizabeth L. David, and William B. Lord.
Unpublished report, Department of Agricultural Economics, University of Wisconsin, Madison, 1968. 69 p, 22 tab, 12 ref.

Descriptors: *Recreation, *Sampling, Demand, Mathematical model, Regression analysis, *Automatic Interaction Detection, Analysis, Investment.
Identifiers: Economics, *Value, *Artificial lakes.

One method of determining the benefits and costs of recreational uses of water resources is to get some measure of the market evaluation of private access to a water front. This report studied the market value of water front plots on man-made lakes (i.e., artificial lakes). The report found that recreational land is much in demand. Increases in property values means an increasing tax base. Also, increases in amounts of waterfront development means more business for the building trades, suppliers, and local businesses. Significant positive relationships were found between the amount of private shoreline property, good water quality, and higher property values. Other variables were also studied. In choosing among the alternative public investments, the higher property values resulting from variants of the characteristics of the site and the lake should be taken into account. (Grossman-Rutgers)

PRELIMINARY ETHNOGRAPHIC STATEMENT OF THE CALAPOOIA RIVER BASIN,
Oregon State Univ., Corvallis.
T. C. Hogg, and R. W. Beard.
Misc Pap, 1968. 34 p, 1 map, 64 ref. OWRR Project A-002-Ore.

Descriptors: *Social aspects, *Rural sociology, *Community development, *Social values, Ecology, Social adjustments, Social change, Social impact, Social needs, Social participation, Bibliographies.
Identifiers: Ethnography.

Interviews were conducted using questionnaires and the 'openended' ethnographic technique. It was concluded that the social organization of the Calapooia both retards and is a prelude to any subsequent resource development. Regions now articulated will have the most difficult adjustment to such growth. Those adhering to a hill tradition will more rapidly acculturate than will those retaining the valley tradition. The basin's ecology is not uniform, and it is economically decentralized and disintegrating. The same factors which operate in the Calapooia plague the underdeveloped regions and countries of the world.

THE ECONOMIC IMPACT ON SOUTHWESTERN WYOMING OF RECREATIONISTS VISITING FLAMING GORGE RESERVOIR.
Wyoming Univ, Laramie, Wyoming, Agricultural Experiment Station.
Rodney C. Kite, and Willard D. Schutz.
Research Journal 11, Agr. Exp. Stat., University of Wyoming, Aug 1967. 24 p, 12 tab, 5 ref, 2 append.

Descriptors: *Leontief models, *Expenditures, Multiplier effects, *Economic impact.
Identifiers: Economics, *Recreation, *Wyoming.

The economic impact and the multiplier effect of expenditures on the following sectors is analyzed: gasoline service stations, food and beverage, and other retail. A detailed statistical breakdown is given of the origin of the recreationists, if their primary purpose was to visit the reservoir, the primary activity they engaged in while at the reservoir, the number and composition of their party, the length of stay, and the distance travelled. The information was obtained through interviews during June, July, and August of 1965. The impact, both direct and indirect, of expenditures on the economic system in the area was derived by use of the multiplier matrix. The multipliers indicate how much economic activity will be generated in a particular sector of the economy by one dollar of new income. The input-output model, which includes the multiplier matrix, is explained in the appendix. (Grossman-Rutgers)

ON THE SOCIAL RATE OF DISCOUNT.
Princeton Univ, Princeton, N.J.
William J. Baumol.
Am Econ Rev, Vol 58, No 4, pp 788-802, Sept 1968. 16 ref.

Descriptors: *Resource allocation, *Discount rate, Planning, Return, Investment, Taxes, Risk.
Identifiers: *Social rate of discount, *Opportunity cost, Public investments, Time preference, Externalities.

The opportunity cost criterion for the appropriate rate of discount on government investments is utilized to examine the implications of factors such as risk and taxes for the discount rate. While the opportunity cost of resources drawn from consumers may approximately be the corresponding rate on government bonds, the opportunity cost of resources drawn from the corporate sector is generally considerably higher. Thus a higher discount rate should apply to all resources withdrawn from the corporate sector whether they would have been used by the firms to produce consumers' goods or producers' goods. It is also shown that the law of large numbers approach to risk also makes for a relatively high social discount rate. Finally, it is pointed out that those who advocate low discount rates on grounds of social responsibility overlook present social needs and pay attention to those of the future. They must assume, perhaps implicitly, that the present investments required for purposes such as slum clearance and education have a relatively low priority in comparison with the needs of our descendants (who will almost certainly be substantially wealthier than we are). (Seneca-Rutgers)

THE INTERINDUSTRY WATER CONTENT MATRIX: APPLICATIONS ON A MULTIREGIONAL BASIS.
California Univ, Berkeley.
Everard M. Lofting, and H. Craig Davis.
Water Resources Research, Vol 4, No 4, pp 689-695, August 1968. 25 ref.

Descriptors: Input-output analysis, Regional analysis, Planning.
Identifiers: *Interindustry, *Water content matrix, *Multiregional, Leontief inverse, Technical coefficients, Water use multiplier.

An interindustry or input-output model represents the structural interdependence of a national or regional economy. The inverse matrix of such a model reveals in each cell the amount of a given commodity necessary for the delivery of a unit of output of product to final demand. Usually, such entries are in dollar terms; however, these values can be converted to factor requirements such as man-years of labor or acre-feet of water. Such matrices are then termed 'factor content' matrices. Some of the specific uses of a 'water content' matrix constructed from a multiregional input-output model of western states and a vector of water use coefficients are discussed. Suggestions are made concerning improvement of the present water use data and the applicability of these data to regional water planning. (Seneca-Rutgers)

WATER QUALITY MANAGEMENT AND THE TIME PROFILE OF BENEFITS AND COSTS,
Water Resources Engineers, Walnut Creek, California.
Denny S. Parker, and James A. Crutchfield.
Water Resources Research, Vol 4, No 2, pp 233-246, April 1968. 9 fig, 2 tab, 6 ref.

Descriptors: *Water quality, *Benefits, *Costs, *Water pollution, Management, Planning, Time, Discount rate, Growth rates.
Identifiers: Long-term benefits, Social cost, Benefit function, Present worth, Present worth of the benefit.

Economists, in evaluating the long-term benefits in public works projects, have traditionally held that long-term benefits will contribute little to the total present worth of the benefits accrued over the life of the project. It is shown, however, that the long-term social cost resulting from projects that cause water pollution cannot be neglected or assumed away in the many practical cases where 'amenity' demands of good water quality in a project's area of influence are significant. REGIONAL ECONOMIC INTERDEPENDENCIES AND WATER USE.
Resources for the Future, Inc., Washington, D C.
L. M. Hartman, D. A. Seastone, Allen V. Kneese, and Stephen C. Smith.
Water Research, pp 215-231, Johns Hopkins Press, Baltimore, 1966. 17 p, 4 fig, 2 tab, 10 ref, 1 append.

Descriptors: *Water utilization, *National income, *Water transfer, Welfare, Efficiencies, Unemployment, Timing, Colorado, Region, Input-output analysis, Resources, Homogeneity, Diseconomies of scale, Capital mobility, Labor mobility.
Identifiers: *Interdependencies, Free-market, *Externalities, *Income effects, Immobilities, Sunk-capital, Agricultural multiplier.

This paper analyzes the economic aspects of the physical and economic interdependencies associated with water use and identifies those effects which have welfare implications. The analysis suggests procedures which would allow the 'water market' to operate in a more efficient manner. The study indicates that certain income externalities exist in water transfer situations and examines the implications of immobilities and unemployment of water transfers that can change national income. Thus, a basis for policy considerations is provided in the planning context and, also, for judging the efficiency of free-market institutions. Unemployment in a water buying area appears to have potentially greater significance on regional income than immobilities in the water losing sector. The timing of water transfers is an important consideration related to the magnitude of sunk-capital facility immobilities and their effect on efficient transfers. The loss of income and adjustments in the public sector are neglected aspects of this problem. Northern Colorado regional input-output model measures of some of the interdependency income effects are presented. (Seneca-Rutgers)

RECREATION BENEFITS FROM WATER POLLUTION CONTROL,
California Univ., Berkeley, California.
Joe B. Stevens.
Water Resources Research, Vol 2, No 2, pp 167-182, Second Quarter 1966. 3 fig, 2 tab, 25 ref.

Descriptors: Demand, *Recreation, Demand schedule, Sports fishing, *Water quality, *Water pollution control, Water pollution effects, Water

pollution, Social value, Oregon, Methodology, Benefits.
Identifiers: Yaquina Bay, Human behavioral relationships, Consumers, *Recreational benefits.

A methodology for estimating direct recreational benefits from water pollution control was developed through a model of biological and behavioral relationships involved in sports angling. A biological production function was envisaged between inputs of angling effort and the output, or yield, of fish taken. The marginal product, angling success per unit of effort, was taken to represent the 'quality' of the recreational experience. Water pollution would cause deterioration in dissolved oxygen temperature or toxicity characteristics of water, thus shifting the production function downward and causing reductions in angling success, angling effort, and the recreational value of the fishery. Demand equations and 'success-effort' elasticities were estimated for three estuarial sports fisheries, and the methodology was illustrated by means of an assumed reduction in angling success. The direct recreational benefits were identified as the consumer surplus that would result from the prevention of water pollution. (Seneca-Rutgers)

RECREATIONAL BENEFITS OF WATER RESOURCE DEVELOPMENT,
California Univ., Berkeley, California.
Leonard, Merewitz.
Water Resources Research, Vol 2, No 4, pp 625-640, Fourth Quarter 1966. 7 fig, 1 tab, 20 ref.

Descriptors: *Demand schedule, Demand recreation, Regression analysis, Benefits, Statistical methods, Water resource development, Model studies, Missouri, Methodology.
Identifiers: *Recreational benefits, *Consumers' surplus, Attendance prediction model, Lake of the Ozarks, Niangua Arm.

Recreation is a purpose of water resource development that should be considered in project evaluation. A demand curve was simulated for recreation at the Lake of the Ozarks in Niangua Arm County, Missouri. Using distance as a proxy for price, the consumers' surplus implied by the demand curve was measured. Cross-sectional variations in associated costs simulated price variations for recreation, a non-market commodity. The basic data necessary for predicting recreation demand are the county's population, population density, distance from the site, and mean income. Variables such as mobility and the availability of alternative recreational opportunity did not appear to be useful in the forms in which they were available. Some relevant considerations in the design of the sample survey are indicated. (Seneca-Rutgers)

RESOURCE ALLOCATION AND THE PUBLIC SECTOR,
Yale Univ., New Haven, Connecticut.
Duncan K. Foley.
Yale Econ Essays, Vol 7, No 1, pp 45-98, Spring 1967. 7 fig, 13 ref.

Descriptors: *Resource allocation, Benefits, *Taxation, Progressive taxes, Tax rate, *Welfare, Political aspects, Social aspects, Government.
Identifiers: *Public goods, Private goods, Preferences, *Equilibrium theory, *Pareto optimality, Utility functions, Proportional taxes.

This essay develops a theory of resource allocation and competitive equilibrium for economies with public goods. Public goods are defined as commodities and services of which every person in a society consumes the total produced. Examples are police protection and defense. Competitive equilibrium is generalized to include a government which is at least minimally responsive to the preferences of citizens. The efficiency prices associated with a Pareto optimum are interpreted to demonstrate the nonexistence of any Pareto optimum, and of an unanimously favored alternative tax and expenditure proposal. The existence of an equilibrium with a proportional income or wealth tax is proved. A brief discussion of the problem of interpersonal utility comparisons is presented and an operational definition of equitable allocation is proposed. The political stability of certain common tax structures, including progressive income taxes in a society with majority rule is investigated and an extension of the theory to the existence of local public goods and the problems of regional government is presented. BOND EVALUATION AS A DECISION UNDER CERTAINTY, RISK OR UNCERTAINTY,
Norweigan School of Economics and Business Administration, Norway.
C. M. Schilbred.
The Swedish Jour Econ, Vol 70, No 1, pp 43-56, March 1968. 2 fig.

Descriptors: *Value, Decision making, *Risk, Probability.
Identifiers: *Bonds, *Redemption date, Lottery bond, Series bond, Annuity bond, Option bond.

According to whether a bearer's bond has been issued under the provision that its future redemption is to take place at a fixed date, in one of a series of lotteries, or at the option of the debtor, the investor's valuation of the bond may be described as a decision under certainty. As investors in bonds are internationally and commonly confronted with such decision problems and are aware of the relevant properties, this is a field where empirical studies of the investor's treatment of risk and uncertainty can be undertaken. Some cursory observations of the applied decision rules are analyzed. (Seneca-Rutgers)

PRIVATE CAPITAL INVESTMENT: A CASE-STUDY APPROACH TOWARDS TESTING ALTERNATIVE THEORIES,
Leeds Univ., Great Britain.
C. M. Cannon.
Jour Indus Econ, Vol XVI, No 3, pp 186-195, July 1968.

Descriptors: Diversification, *Investment, Profit, *Capital, Expenditures, *Risks forecasting, Demand.
Identifiers: Liquidity, Expand production, Production process, Factory capacity, *Accelerator theories.

This paper considers information collected and used by four businesses, and then formation of expectations during their appraisal of proposals for four factory investments. The businesses were very large, each with an international reputation. Four large capacity expansion investments were selected for further study out of 14 investments selected by these firms for investigation by the Manchester University Center for Business Research. The case-study evidence was consistent with an absolute sales-capital stock form of accelerator relation, if the subjective character of expectations of market size is admitted. On the other hand, if a marginalist approach admits rigidities in expectations and imperfections in planning and financial control, it will provide a similar prediction to that of an accelerator relation: changes in the ration of expected absolute sales to capital stock will determine changes in the level of private capital investment. The evidence also suggests that this accelerator relation was abruptly recognized as inadequate by businessmen who were experiencing a downturn in the business cycle; only then was attention turned to a financial summary of the worth of expenditure proposals. OPTIMUM INVESTMENT IN STRUCTURAL FLOOD CONTROL,
Rutgers, The State Univ., New Brunswick, New Jersey, Water Resources Research Institute.
William Whipple, Jr.
Journal of the Hydraulics Division, ASCE, Vol 94, No HY6, Proc Paper 6238, pp 1507-1515, November 1968. 9 p, 2 fig, 2 tab, 9 ref.

Descriptors: *Cost-benefit analysis, *Flood control, Flood plain zoning, Flood plains, Flood plain insurance, *Flood damage, Investment.
Identifiers: Structural improvements, Intangible damages, Municipal area, Corps of Engineers, *Project-induced growth, Partial control.

National flood damages have been increasing, despite extensive construction programs, due largely to economic encroachments on the flood plain. This situation calls for a reconsideration of flood control economics. Much of this encroachment occurs as a result of the areas being protected by flood control projects and may be described as project induced. Analysis of project-induced damages indicates that, contrary to certain critics, only quite high degrees of flood protection can be justified economically. As a result of this approach, benefit-cost ratios as usually computed should be reduced. Basin-wide reservoir systems inherently involve extensive partial flood protection, due partly to the extension of effects downstream and partly to the continual economic development in flood plain areas lower than those to which adequate protection is afforded. Therefore, some way must be found to control project-induced growth downstream, as an adjunct of reservoir systems. This could be done by general reservation of floodways downstream of flood control reservoirs. (Seneca-Rutgers)

AN ASPECT OF PROJECT-SELECTION DURABILITY VS. CONSTRUCTION PERIOD,
Peterhouse College, Cambridge Univ, Great Britain.
Amit Bhaduri.
Econ Jour, Vol LXXVIII, No 310, pp 344-348, June 1968. 1 fig.

Descriptors: *Durability, Capital, Investment.
Identifiers: *Construction period, *Gestation lags, Time rate of discount, Fixed assets, Capital-output ratios.

The question is examined of balancing the economic 'advantage' of longer durability against the 'disadvantage' of longer construction-period in selecting among alternative projects producing a given commodity. Assuming that the time-path of the investment-fund to be alloted for installing projects is known and also, that time-path of investment is rising at a steady percentage rate over time, the paper establishes the following result: a faster-growing economy may find it more advantageous (other things being equal) to install projects of shorter durability and shorter construction-period. The main point of the paper is to indicate how choices involving time in project evaluation can be settled through the assumed rate of growth of investment, rather than the hazy and less operational notion of a 'social rate of time-discount.' TAX AND INCOME STABILIZATION,
Trinity College and Institute of Public Administration, Dublin, Ireland.
J. A. Bristow.
Econ Jour, Vol LXXVIII, No 310, pp 299-311, June 1968. 1 fig.

Descriptors: *Stabilization, Investment, Consumptive use, *Tax rate.
Identifiers: *Cyclical fluctuations, *Policy lag, Revenue, Dividends, Income tax, Indirect taxes, Marginal propensity to consume.

An attempt was made to assess the effects on cyclical variations in the rate of income growth in the United Kingdom (1955-1964) of one component of stabilization policy-tax changes. First a quantitative model was constructed. This model was to show the effects of various types of tax change, on a quarterly basis. The effects of all tax changes 1955-64 were estimated, and these effects were deducted from the actual quarterly outcome of four variables--Gross Domestic Product, total expenditure, consumption, and gross investment. This gave an estimate of what would have occurred if there had been no tax changes. The result was increased stability, providing some support for the view that tax changes are usually made too late to be ideal anticyclical measures. (Seneca-Rutgers)

EXTERNAL ECONOMIES AND SECOND-ORDER OPTIMALITY CONDITIONS,
Princeton Univ., Princeton, New Jersey.
William J. Baumol.
American Econ Rev, Vol LIV, No 4, part 1, pp 358-372, June 1964. 2 fig, 7 ref, 3 append.

Descriptors: *Optimization, Return to scale.
Identifiers: Social welfare function, Corner points, *External economies, Social cost, *Second order conditions, *Public policy.

The following propositions are demonstrated and explained: (1) an industry characterized by external diseconomies may produce an output less than the social optimum even if the economy is in competitive equilibrium and all other industries yield external economies. (2) There is no general validity to the neoclassical proposition which alleges that external benefit yielding activities will be below the optimal level. (3) The presence of externalities is likely to lead to multiple maxima in the social welfare function and to violation of the second order maximum conditions. (4) The neoclassical position referred to in (1) and (2) above is likely to fail because we may move toward a local optimum by increasing output when marginal social benefit exceeds marginal social cost. (5) Even if the second order conditions hold, the neoclassical proposition is still invalid except where marginal social costs and benefits are exactly equal for all activities but one. (6) Policy prescription is more complicated and its conclusions more ambiguous than previously thought. It is only known that some activity yields external benefits (or diseconomies) of unspecified magnitude, from this alone it is impossible to determine whether the activity should be expanded or contracted. IS PUBLIC INTERVENTION IN WATER RESOURCES DEVELOPMENT CONDUCIVE TO ECONOMIC EFFICIENCY,
Resources for the Future, Inc., Washington, D. C.
John V. Krutilla.
Natural Resources Jour, Vol 6, No 1, pp 60-75, January 1966. 1 tab.

Descriptors: *Efficiencies, *Welfare, *Water resources development, Institutions, Prices, Marginal costs, *Cost-benefit analysis, *Water management.
Identifiers: *Public intervention, Indivisibilities, Marginal social product, Marginal social cost, Coupon rates, *Reimbursement policy.

Observations on the institutional machinery of public intervention at the present time merit serious consideration when the question is posed with respect to the sufficiency of public intervention for the improvement of efficiency in the water resource development field. A concerted effort should now be made to review the character and capabilities of existing agencies, to identify barriers to improved performance, and to address the problem of organizing a capability consonant with present and future requirements. Not a little could be learned from the pioneering work in water quality management by the cooperative water quality management associations in the Ruhr, or the integration of investment planning, design criteria and pricing policy of Electricite de France. Doubtless a similar spirit of innovation in the water resources field in the United States would add a considerable measure of assurance that public intervention would be sufficient as well as necessary to improvement of efficiency in water resources development programs. ISOLATION, ASSURANCE AND THE SOCIAL RATE OF DISCOUNT,
Delhi Univ., India, Delhi School of Economics.
Amartya K. Sen.
Quart Jour Econ, Vol LXXXI, No 1, pp 112-124, February 1967.

Descriptors: Consumptive use, Time, Return.
Identifiers: Zero-sum game, *Social rate of discount, Optimum savings, Social contract, *Isolation paradox, *Assurance problem.

Recent discussions on the relationship between private and social rates of discount have been concerned with a special application of a very general problem, this being a N-person extension of the 2 person non-zero sum game of the 'Prisoners' Dilemma.' In the first section the nature of this general problem (the isolation paradox) is studied. In the remaining three sections the application of this general framework to the question of optimum savings and the social rate of discount is examined. In particular, Lind's criticism of Marglin's analysis of the divergence between the social and private rates of discount is examined. Finally, the question of the future generation being much richer (on the average) than the present generation is studied as a ground for an objection that has been raised in the literature against chances of the occurrence of the 'isolation paradox.' It is shown that a change in the average wealth of the future generation vis-a-vis that of the present generation leaves the possibility of the 'isolation paradox' completely unchanged. (Seneca-Rutgers)

CONVENTION AND LIMITATION IN BENEFIT-COST ANALYSIS,
Stanford Univ., Stanford, California. Food Research Institute.
Richard J. Hammond.
Natural Resources Jour, Vol 6, No 2, pp 195-222, April, 1966.

Descriptors: Prices, *Cost-benefit ratio, *Cost repayment.
Identifiers: Bureau of Reclamation, Infallibility, Secondary benefits, Market, Maximization.

Official doctrine on benefit-cost analysis presents contradictions of principle and mistakenly neglects administrative considerations. The contradictions appear to be due to misunderstanding of the role of theory in economic questions, whereby statements of principle having no relation to empirical fact are treated as maxims of conduct, and theorems based on the assumption of perfect foresight are applied in a world where the future is inherently uncertain. Critics of present governmental practice habitually argue for a greater recourse to benefit-cost analysis in the name of efficiency. They forget that economics cannot go beyond defining efficiency to ensuring it. On the contrary: the question is rather whether the analysis is not being overdone, in the belief that it can somehow dispense with the need for political and administrative decisions. What is needed is a candid recognition of its inherent limitations: that it cannot forecast the future and is incapable, by reason of its dependence on policy assumptions, of becoming the basis of policy decisions. It is a useful administrative tool in limited applications, not a solvent for major economic problems in the field of resource use. (Seneca-Rutgers)

CONCLUSIONS ABOUT WATER SUPPLY,
Rand Corporation, Santa Monica, California.
Jack Hirshleifer, James C. DeHaven, and Jerome W. Milliman.
Water Supply Economics, Technology and Policy, Univ. of Chicago Press, 1963, pp 357-367.

Descriptors: Water supply, Technology, *Administrative decisions, Investment, Pricing, Welfare, Attitudes, Social values, Market, Adoption of practices, Water law, Economic evaluation, Institutional constraints, Political aspects, Attitudes, Federal governments, State governments, Local governments.
Identifiers: Decentralized decision making, Alternatives.

The economics, technology and policy of water supply are examined. The major purpose was to show by argument and example that the correct application of economic principles will produce the greatest efficiency in water supply procurement and utilization in relation to and in competition with all other desires of the community. In this country major water investments are typically prematurely undertaken, resulting in overinvestment in water supply. Reasons for this are discussed. Decentralized decision making is the preferred manner, with private, local, state and federal decision making ranked in that order. Much of the present misuse of water within the sphere governed by the market can be traced to imperfections in water law and its administration. Suggestions for improvement are given. The importance is stressed of considering a wide range of planning alternatives. Significant new developments in technology are also reviewed. In conclusion the 'water is different' philosophy is criticized and water resources are shown to be an economic resource similar to land and should be treated economically, and politically in the same manner. WATERSHED DEVELOPMENT IN THE COMMUNITY FIELD,
Mississippi State Univ, Water Research Institute; Social Science Research Center, State College, Mississippi.
Kenneth P. Wilkinson.
Rep, Mississippi State Univ, 1968, 11 p, 14 ref.

Descriptors: *Watershed development, Community development, Social aspects, Sociology, Social impact, Social change, *Social participation, Water resources development, Social needs, Social values, Social behavior, Local governments, *Planning, Social function.
Identifiers: Dynamic field, Field theory.

The paper is concerned with the interaction between local and extralocal social structures and processes using watershed development as an area of investigation. The stated objective of the paper is to provide both a logical and empirical basis for the development of hypotheses action. The framework developed would be applicable to urban and other local contexts, including metropolitan areas. Community is viewed in terms of social field theory. The community field is characterized by actors, associations and activities, and has a distinct direction or focus. Distinction is made between societies according to the degree of coordination or integration among interest field and among the interest fields within a given local society. Hypotheses are

advanced relating levels of task accomplishment and four types of community-agency fields: internally consistent fields; coordination action style; internally inconsistent fields; and autonomous action style. Two empirical community studies are reviewed and interpreted in light of the hypotheses. (Abodeely-Chicago)

MUNICIPAL WATER SUPPLY,
Rand Corporation, Santa Monica, California.
Jack Hirshleifer, James C. DeHaven, and Jerome W. Milliman.
Water Supply, Economics, Technology and Policy, Univ. of Chicago Press, 1963, pp 175-181, 2 tab, 7 ref.

Descriptors: *Municipal water supply, Costs, Evaluation, Wastewater treatment, *Water distribution, Water consumption, Project planning, Optimum development plans, Interest rates, Sewerage systems, Water transfer, Unit costs.
Identifiers: Economic constraints.

General characteristics of municipal water supply systems are: (1) sources of raw water, (2) transmission system, (3) treatment facilities, (4) distribution network, (5) pumps and storage capacity, (6) valves, hydrants, and meters to control and measure flow. The total cost of the municipal water system lies in three major areas: (1) production, transmission, and treatment costs; (2) distribution costs; and (3) fire protection. Investment and operating costs differ from city to city. Water treatment costs are discussed in relation to capacity and interest rates. The choice of a transport system is influenced by terrain features, total capacity, length of the system, and the relative costs of the alternative types of elements and of pumping. No generalized cost information has been developed relating to large water transmission systems but a discussion of specific cost factors is given. The economic considerations of consumptive losses in public systems are reviewed and alternatives for improvement suggested. (Gargola-Chicago)

HUMAN RESOURCES AND REGIONAL DEVELOPMENT: SOME LESSONS FROM FRENCH EXPERIENCE,
Kentucky Univ., Lexington.
Niles M. Hansen.
Southern Economic Journal, Vol 34, No 1, pp 123-132, July 1967. 1 tab.

Descriptors: *Human resources, Migration, Education, Training, Land development, Economics.
Identifiers: France, *Regional development.

The underdevelopment of France's agricultural regions of the West has been attributed to the attractiveness of the Paris region and to the need for land reform and larger farms in the West. Although these factors are important, a more fundamental problem is the lack of investment in the quality of human effort. While trying to maintain a large population in the lagging agricultural regions, French policy in past years has neglected human resource investment. In recent years more emphasis has been placed upon human resource investment, but this emphasis has not been strong enough. Both theoretical propositions developed previously by the author and the data considered in the article support, by opportunity cost criteria, the case for emphasizing human resource development. (Seneca-Rutgers)

WEALTH AND INCOME DISTRIBUTION, INVESTMENT, AND ECONOMIC DEVELOPMENT,
Wayne State Univ., Detroit.
Hector Correa.
Southern Econ Jour, Vol XXXIV, No 2, pp 283-285, October 1967.

Descriptors: Capital, Credit, *Investment, Profit, *Financing.
Identifiers: Leisure, Capital intensive, *Income distribution, *Concentration of wealth, Management, *Economic development.

This paper attempts to show how a high concentration of wealth and income influences the behavior of savers and investors and, therefore, economic growth. The relationships presented are to be considered as a hypothesis, which could be validated by empirical research. However, there is at present a lack of available data. As a substitute it is shown that several characteristics of the developing countries in which conditions of high concentration of income are assumed to exist can be considered logical consequences of the hypotheses presented. (Seneca-Rutgers)
W69-01103

CRITERIA FOR PUBLIC INVESTMENT: SOME SIMPLIFYING SUGGESTIONS,
London School of Economics, Great Britain.
E. J. Mishan.
Jour Pol Econ, Vol 75, No 2, pp 139-146, April 1967. 1 fig, 8 ref.

Descriptors: *Interest rate, *Discount rate, *Investment, Financing, *Benefits, Constraints.
Identifiers: Social opportunity cost, Opportunity yield, Social rate of time preference, Present value, Perpetuity, Market yield.

An appropriate public investment criterion, under conditions of certainty, requires that the present value of an investment project exceed its social opportunity cost. Recently three features have been built into such models, each of which, within a full employment framework in which the social rate of time preference exceeds the market yield, can be shown to be invalid: (1) a distinction between debt finance and tax finance, (2) discounting future returns at the social rate of time preference as a necessary requirement, and (3) reinvestment of some fixed proportion of the primary, secondary, and subsequent stream of returns at the market opportunity yield. The criterion is simplified by a correct allocative approach. In the particular case where all benefits are revenues the public investment criterion is met if the present value of the stream of benefits and outlays is positive--when discounted at the existing market opportunity yield and not the social rate of time preference. (Seneca-Rutgers)
W69-01104

RESTRAINTS AND THE ALLOCATION OF RESOURCES,
Kent Univ., Canterbury, Great Britain.
Charles Kennedy.
Oxford Econ Papers, Vol 20, No 2, pp 195-207, July 1968. 2 fig, 16 ref.

Descriptors: Investment, Expenditures, Financing, *Resource allocation, Constraint, Growth rates, *Import.
Identifiers: *Saving, Scarcity, *Underdeveloped countries, *Foreign exchange, Numeraire, Production function, *Substitution.

The Keynesian proposition that saving is not a resource is valid not merely for the case of underutilized resources. Its general application arises from the negative character of saving. A simple version of the theory of dominant restraint holds that there may be two possible restraints on the growth of output but that only one will be operative at any one time. The objection to this theory is that it unrealistically presupposes a complete lack of substitutability between imports and capital. The possibility of substitution between imports and capital enhances the importance of foreign borrowing in facilitating economic growth, and makes any treatment of saving as a quasi-resource illegitimate. The treatment of saving as a numeraire for valuing other resources is also criticized, for most countries foreign exchange would be more appropriate. While the necessity to consider more than one scarce resource has already been proved, it is suggested that a developing country would do better by using a crude 'foreign exchange' criterion than by using a more sophisticated approach that included saving (capital) as one of the resources. (Seneca-Rutgers)
W69-01106

WELFARE MAXIMIZATION: THE SIMPLE ANALYTICS WITH PUBLIC GOODS,
Rice Univ., Houston, Texas.
Charles E. McLure, Jr.
Canadian Jour Econ, Vol 1, No 3, pp 633-639, August 1968. 2 fig.

Descriptors: *Resource allocation, Alternative costs, *Optimization.
Identifiers: *Pareto optimality, Jointness in supply, Conflict curve, *Public good, Income redistribution, *Social welfare function.

This note attempts to demonstrate how public goods can be incorporated in the analysis of welfare maximization. One major change is made in the marginal conditions for Pareto optimality when a public good is introduced. The box diagram and conflict curve are considerably altered, the marginal conditions for over-all efficiency become equality of the marginal rate of transformation and the sum of the marginal rates of substitution for the two individuals, and there are no marginal conditions for efficiency in exchange. This is a crucial difference. Voluntary exchange does not occur since each person realizes that his consumption of the public good is largely independent of his contribution to its provision. Because of the impossibility of trade in the public good, the market does not assure that the optimal amount of the public good is produced and the 'invisible hand' fails to achieve even the marginal conditions necessary to maximize social welfare. (Seneca-Rutgers)
W69-01107

OPTIMAL ECONOMIC GROWTH AND DISTRIBUTION AND THE SOCIAL UTILITY FUNCTION,
McGill Univ., Montreal, Canada.
A. Asimakopulos.
Canadian Jour Econ, Vol 1, No 3, pp 540-550, August 1968.

Descriptors: *Optimization, Population, Marginal productivity.
Identifiers: Biological interest rate, *Intertemporal allocation, Social welfare function, *Growth path, *Intergeneration distribution.

The choice of social utility functions for intergeneration distribution and intertemporal allocation should be made after examination of the results of their application. The Lerner-type function which takes into account group size was preferred for the first purpose, but a function which makes no allowance for population size should be used for the second purpose if fairness to all is a criterion of policy. This function can, however, display positive time preference. These two social utility functions are not inconsistent; they are constructed to deal with different tasks and can both be used by the same planning board. The justification for using a Lerner-type social utility function for intergeneration distribution is not that it gives the same results as the hedonistic function described in the article, but that it prevents discrimination between individuals in different generations which is inconsistent with individual preferences and production conditions. Lerner judges this result to be fair to all individuals in the circumstances of the particular problem. Samuelson's optimum overcompensates for the discrimination over time, that it is purportedly trying to avoid, by giving a consumption bonus to the individuals living close to the terminal period of the plan. WATER RESOURCES PLANNING STUDIES OKLAHOMA AND ARKANSAS.
Oklahoma State Univ, Stillwater.
A. F. Gaudy, Jr.
Water Resour Planning Studies, Prog Rep, Oklahoma State Univ, Feb 1968. 20 p, 5 fig, 5 tab. OWRR Project B-006-Okla.

Descriptors: *Water resources, Planning, Water allocation (Policy), Long-term planning, Coordination, Water rights, Water utilization, *Water supply, *Equitable apportionment, *Interstate compacts, Oklahoma, Arkansas.
Identifiers: *Arkansas River.

A study is in progress to assess the water resource available in that portion of the Arkansas Basin in northeastern Oklahoma. The study involves evaluation of five sub-basins (Spavinaw Creek, Illinois River, Lee Creek, Poteau River, and the Arkansas River) with respect to flood and drought flows. One of the aims of the work is to provide accurate estimates of the quantity of water available in these sub-basins for use by agencies of the states of Oklahoma and Arkansas in apportioning the joint water resources in accordance with available conservation storage. In the present report, the Poteau River Basin and the main stream of the Arkansas River are considered. Floods occurring in the entire study area were studied for magnitude and frequency with special emphasis on the problems created due to the short period of available record. For low flow analysis, a Markov Chain Model was applied to render the area hydrologically stable, preserving the essential statistical characteristics of the record, and the results obtained using this model are advocated as the basis for conservation storage. Available information pertaining to water quality, coupled with the water quantity analysis, will provide useful knowledge for further development and regional planning with respect to the water resource.

THE HUMAN FACTOR AND CHANGES IN WATER USAGE PATTERNS,
Utah State Univ, Logan.
H. Bruce Byland.
Water Resour Res, Vol 2, No 3, pp 365-369, Third Quart, 1966. 5 p, 8 ref. OWRR Project A-001-UTAH.

Descriptors: *Water utilization, Economics, *Social change, Social needs, *Phychological aspects, Social aspects, *Attitudes, Decision making, Laws, Civil engineering, Economic impact, Utah, Water resources development, Economic justification, Project planning.
Identifiers: Human relations, Bear River Project.

This paper reports on preliminary work of a study dealing with cultural, social organizational, and social-psychological factors associated with a proposed change in water usage patterns. Moves and counter moves related to opposition to a proposed Bureau of Reclamation development on the Bear River in Utah, are used as a focal point. Results manifest the expected opposition: general opposition to change at a covert emotional level, more reasoned opposition by individuals and groups with a vested interest (economic, political, and social) and apparent tactics of vested interest groups to sway public opinion. Opposition to the project developed, was organized and operating 19 months before a committee was organized to promote the project. There were over 1-1/2 times as many articles in newspapers against the project as there were articles on factual information and those that were for the project. Conclusions were that more research in the human aspects of water use and organization for social engineering to augment civil engineers are imperative if our water resources are to be adequately developed.

Jabbar K. Sherwani, Emil J. Gumbel, and Robert V. Thomann.
Water Resour Res Center, Blacksburg, Dec 1965. 68 p, 7 fig, 2 tab, 18 ref. OWRR Project A-999-VA.

Descriptors: Optimum development plans, Decision making, Economic efficiency, Social impact, Systems analysis, Hydrology, Estuarine environment, *Water resources, *Water pollution, *Water policy.

Purpose of the seminar was to stimulate interest in multidisciplinary research in water resources, especially among disciplines traditionally inactive in the field, by showing the increasing number of research opportunities and needs in water resources. Four papers were presented during the seminar: 'Optimal Water Use - A Multidisciplinary Approach,' by Jabbar K. Sherwani; 'Survey of the Theory of Extremes as Applied to Hydrology,' by Emil J. Gumbel; 'Estuarine Water Pollution Control Via Systems Analysis,' by Robert V. Thomann; and 'Multidisciplinary Research on an Estuarine Engineering Project,' by William J. Hargis, Jr.

WATER RESOURCES PROGRAMS IN VIRGINIA,
Virginia Polytechnic Institute, Blacksburg.
William R. Walker.
Water Resour Res Center, Bull 4, Oct 1966. 235 p, 8 fig. OWRR Project A-999-VA.

Descriptors: Water pollution, Water quality control, Recreation, Drainage engineering, Erosion control, Decision making, Runoff, *Water resources, *Virginia, Forecasting, Industrial wastes, Industrial water, Streamflow forecasting.

A symposium on Water Resources Programs in Virginia brought together representatives of various agencies, commissions, and citizens groups who were involved in the planning and executing of water-related activities in the Commonwealth. Purpose of the seminar was to investigate past and present programs of these agencies and groups in order that future planning might be better coordinated, duplication of effort minimized, and freer exchange of ideas fostered. Reports were presented by federal and state agencies and local groups including the U. S. Army Corps of Engineers, Virginia State Water Control Board, Virginia Department of Health, Cooperative Extension Service, Virginia Soil and Water Conservation Commission, Commission on Outdoor Recreation, Roanoke River Basin Association, James River Basin Association, Interstate Commission on the Potomac River Basin, Tennessee Valley Authority, Department of Health, Education, and Welfare, U. S. Geological Survey, and Virginia Institute of Marine Science. (W. R. Walker-Va Tech)

COMPREHENSIVE RIVER BASIN PLANNING: THE LOWER MEKONG EXPERIENCE,
Wisconsin Univ, Madison.
W. R. Derrick Sewell.
Rep, Water Resour Center, June 1966. 26 p, 4 fig, 4 tab, 26 ref. OWRR Project A-999-WIS.

Descriptors: *River basins, *River basin development, *Water resources development, Project planning, United nations, Foreign countries, Water utilization, Foreign projects, Irrigation, Planning.
Identifiers: Mekong Delta, Mekong River Project.

Despite political chaos, the Lower Mekong is the first successful application of a comprehensive approach to development of an international river. It is the first instance of direct UN sponsorship of planning and development of an international river on a continuous basis, and is an outstanding example of international cooperation in scientific investigations, planning and development. The most important lesson of the Mekong experience, is that water resources planning can be an effective device for overcoming political tensions. The Mekong Committee has survived despite the political turmoil of the region. The signing of an agreement for international exchange of electric power emphasizes the sense of common purpose which water resources planning can engender.

POPULATION TRENDS FOR THE PLATTE AND GREEN RIVER BASINS IN WYOMING: 1890-2010,
Wyoming Univ, Laramie.
Raymond K. Kenney, and John W. Birch.
Wyo Water Resour Res Inst, Water Resour Ser 4, July 1967. 41 p, 4 fig, 7 tab, 22 ref. OWRR Project A-001-WYO.

Descriptors: *Water requirements, Forecasting, Statistical methods, Water utilization, Municipal water, *Population, *Population growth, Bibliographies, Census, Future planning, Statistics, Domestic water, *Human population, Community development, Wyoming.
Identifiers: Platte River Basin (Wyo), Green River Basin (Wyo).

Long-term population growth forecasts are made for the Green and Platte River Basins, Wyoming. Projections are made for 5-yr intervals, by counties, for 1970 to 2010. Time series census data, adjusted for county boundary changes, provided the empirical base for the projections. Projections for the entire basins were derived by summation of separate counties and from summation of population data for the entire basin. These projections will serve as a basis for estimating future residential water requirements.

THE 1960 CALIFORNIA WATER BOND ISSUE AND THE LOS ANGELES COUNTY ELECTRORATE: A STATISTICAL AND HISTORICAL ANALYSIS,
California Univ, Los Angeles.
Dwaine Marvick.
Water Resour Center, Tech Completion Rep, Nov 1967. 117 p, 14 tab, 172 ref. OWRR Project B-013-CAL.

Descriptors: *Water resources development, *California, Planning, *Analysis, Coordination, Legislation, Feasibility, *Financing, Government financing.
Identifiers: Los Angeles County (Calif.).

In 1960 a water bond referendum on the Nov ballot in Calif was approved by a slim majority. This confirmed the vast construction program authorized by the 1959 state legislature; the voters had approved the issuance of 1-3/4 billion dollars in general obligation bonds of the State of Calif. This amount was enough to complete at least one major project and enough to commit Calif to a coordinated and systematic plan for developing statewide water resources. Los Angeles county carried the day; its voters approved Proposition 1 by 56% of the votes cast. Without this margin of support from the State's largest metropolis, the water bond referendum would not have passed. Viewed from the perspective of 1967, it is desirable to clarify the sociological and political correlates of public awareness of, interest in, and willingness to support the large outlays of public funds needed for the maintenance of an adequate water supply for Los Angeles county. Such clarification is possible by appropriate statistical analysis of the electoral and demographic data for 1960 available for each of the 1297 census tracts of Los Angeles county.

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

AN ACT TO REGULATE WATER COMPANIES AND THE SALE AND DISTRIBUTION OF WATER WITHIN THE STATE.

Michigan Acts 1967. Act No 19, 4 p.

Descriptors: *Michigan, Legislation, Water distribution, Water conveyance, Water costs, *Administrative agencies, Water users, Water demand, Waterworks, *Water rates, *Utilities.

Michigan places the regulation of all private water companies in the control of the public service commission. All extensions or discontinuances of service must be authorized by the commission. The commission must approve all present rates and any future changes in rates. The burden of proof is on the water companies to show that their rates or proposed rates are reasonable. The commission polices the water companies to insure that their service is good and no favoratism is shown to any customers. The commission is authorized to investigate and hold hearings on any complaints received or on its own motion. Any water company dissatisfied with the judgment of the commission may appeal to the circuit court. Upon trial of the action, no new evidence may be introduced until first submitted to the commission for reconsideration of the finding. The burden of proof is on the complainant to show by clear and satisfactory evidence that the order of the commission is unlawful or unreasonable. (R. H. Watson-Fla)

SCOZZAFAVA V US (GOVERNMENT USE OF STREAM BEDS).
199 F Supp 43-46 (D C N Y 1961).

Descriptors: *Ownership of beds, Navigable waters, *River beds, Eminent domain, Water law, Legal aspects, Federal government, Navigation.
Identifiers: Dominant servitude.

The question is whether the owner of the river bed of a navigable stream may demand rent from the United States for the storage of the latter's deactivated vessels in the stream. The court noted that the title of the owner of fast land on the shore of a navigable waterway is subordinate to the public right of navigation and the power of Congress over the improvement of navigable rivers. Lands below the high water mark are subject to a dominant servitude in the interest of navigation. The deciding issue is whether the government's acts are in aid of navigation thereby freeing the government from a duty of compensation. The court held the question to be one of fact and not to be decided on a motion to dismiss. (Horner-Fla)

PRELIMINARY DESIGN AND SIMULATION OF CONVENTIONAL WASTEWATER RENOVATION SYSTEMS USING THE DIGITAL COMPUTER,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
Robert Smith.
Water Pollut Contr Res Ser Publication No WP-20-9, 64 p, March 1968. 34 fig, 2 tab, 71 ref, 1 append.

Descriptors: *Waste water treatment, *Cost analysis, *Digital computers, *Computer programs, *Computer models, Research and development, Design, Sanitary engineering.
Identifiers: *FORTRAN program, Renovation systems.

A digital computer method and a FORTRAN IV Program listing, used to bring together previously separate calculations for cost and performance of the individual processes waste water treatment systems into one computation for an entire system, are presented with a thorough review and discussion of the subject. This program makes it possible with a fair degree of reliability to compute the capital cost, amorization or debt service cost, and operating and maintenance cost of the entire plant or of individual processes or groups of processes, as a function of independent design parameters. The parameters are plant design capacity, influent stream, fraction of suspended solids removed in the primary settler, mixed liquor suspended solids held in the aerater, demand BOD of plant effluent, and detention time for the digester. Results of computations are shown in tables and graphs. The program was slanted toward preliminary design rather than operation simulation, but the difference is not fundamental because only steady state performance is considered. (Knapp-USGS)
W69-00926

THE LEVEL OF DEVELOPMENT OF WATER RESOURCES,
Joe S. Bain, Richard E. Caves, and Julius Margolis.

In Northern California's Water Industry, Resources for the Future, Wash., D. C., 1966, Chap 15, pp 529-554, 8 ref, 3 tab.

Descriptors: Annual rates, Water resource development, *Methodology, *Water use, Marginal costs, Rate of return, Benefit-cost ratio, Pricing, Marginal benefits, Average costs, Water values, Market value, Administrative decisions, Electric power costs, Marginal productivity.
Identifiers: Sacramento Valley, Northern California, Central Valley, *Water usage development, Water facilities development.

An analysis of the performance of the water industry in Northern California is discussed under the three broad headings of (1) level of development, (2) sequence of development, and (3) rationality of development. Two definitions of the level of development include, (1) level of water facilities development, ie., the quantity of non-water resources going to make water available for use, and (2) 'water usage development,' which is defined at length. The rationality of development is appraised through evaluation of present water allocation among users, uses, sites, and time. Measurement of the above factors is considered in situations of water scarcity and plenty. As standards of measurement, marginal values, rates of return, and benefit-cost ratios are considered. Evaluation of local public water agencies is done through deductive inferences and inductive measures of performance. Statistical evidence on the level of development of these local agencies is through analysis of rates of return, and relation of long-run marginal costs to marginal values. In a similar, but brief, manner, the level of development and behavior of large wholesale agencies is also considered. (Gargola-Chicago)

THE INVESTMENT DECISION,
Resources for the Future, Washington, D. C.
Joe S. Bain, Richard E. Caves, and Julius Margolis.

In Northern California's Water Industry, Chap 11, 1966, p 363-79, 1 tab, 19 ref.

Descriptors: *Water supply, Water demand, Discount rate, Decision making, Intangible benefits, *Evaluation, Water rates, Discriminatory pricing, Municipal water supply, Evaluation, Water resource planning, Water users, Water values, Financial feasibility, Financing, Capital investiment, *Investment, Water law, *Institutional constraints.
Identifiers: San Francisco Bay Area, Uncertainity, East Bay Municipal Utility District.

Important environmental forces affecting investment decisions in the San Francisco Bay area are (1) rivalry of agricultural uses, and (2) multiplicity of governments. In light of these factors the internal decision making and investment criteria of urban agencies is considered. Some of the requirements for agency investment are: (1) prompt arrival of supply, (2) capital outlays financed by revenues, (3) adequate supply to meet long-term needs, (4) high quality water, (5) minimization of cost. Evaluation of benefits is rarely considered, due to difficulties in their assessment, so minimization of cost is the only real economic consideration. The discount rate, treatment of uncertainty, and adjustment for future price changes is discussed, and possible sources of error in the use of the factors are considered. Performance uncertainties created by external forces bearing on water investments are demonstrated by examples of urban water agency experiences in the bay area. (Gargola-Chicago)

MUNICIPAL WATER RATES,
Rand Corporation, Santa Monica, California.
Jack Hirshleifer, James C. DeHaven, and Jerome W. Milliman.
Water Supply, Economics, Technology, and Policy, 1960, p 87-112, 4 fig, 2 tab.

Descriptors: Discriminatory pricing, Water allocation, *Municipal water supply, Average costs, Marginal costs, Average prices, *Economic evaluation, Optimum development plans, Economic efficiency, Market value, *Water rates, Water values, Peak load, Joint costs, Economies of scale.
Identifiers: Optimum output, Two-part tariff.

Discussed is the applicability of theoretical principles of pricing to municipal water rates. Explored in relation to this are the alternatives of average cost vs. marginal cost pricing. In either case, whether or not a profit is possible, a loss is incurred at the optimal output if a single price is charged. Several possible ways to overcome the difficulty are given: (1) government subsidy, (2) receiving as revenue voluntary contributions for continuation of service, (3) setting up descending scale of prices, (4) a two-part tariff system, and (5) price discriminations. The problem of adjusting rates to different classes of consumers is considered in discussing joint costs. A detailed discussion of costs as functions of scale of output, and classification of costs is given. The merits of either capacity charge or peak load pricing are reviewed and considerations of the water demand in fire protection is discussed. Under-pricing and over-building in water supply are also considered. In conclusion, the results of previous discussions are drawn together and suggestions made for development of future municipal water rates. (Gargola-Chicago)

INSTITUTIONAL SUGGESTIONS FOR WATER QUALITY MANAGEMENT,
Resources for the Future.
Allen V. Kneese, and Blair T. Bower.
Managing Water Quality: Economic, Technology and Institutions, Baltimore: Johns Hopkins Press, 1968, Chap 14, pp 301-318, 1 tab, 11 ref.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Water quality control, Non-structural alternatives, Water resource management, Institutional constraints, Adoption of practices, Regional analysis, State governments, Local governments, *Administrative decisions, Decision making, Federal government, Industrial wastes, Effluents, *Control systems, Optimum development plans.
Identifiers: Effluent charges, External costs.

To provide a firm foundation for efficient progress in water quality management an economic optimization approach is suggested. Agencies should be established with powers to plan and implement management programs for entire regions. Granted these powers agencies should be able to, (1) progress toward systematic methods for reflecting external costs associated with water discharges, (2) define, evaluate, and implement measures to reduce adverse effects of waste discharge, (3) produce more efficient operation of water quality management system, (4) adapt new knowledge and technology, (5) give consideration to impacts of spatial patterns of economic activities on water quality management. With the above factors as stated goals of regional water quality management, there are certain criteria which should be met if agencies are to be effective; i.e. the ability to internalize major externalities, implement relevant measures, take account of significant interrelationships, and provide opportunities for affected parties to have a voice in decisions. The role of the federal, state and local governments in the formulation of this regional is defined, with suggestions for the financing. Systems of direct regulation, charges for waste discharge, and payments to dischargers are discussed as possible means of revenue. The advantages and disadvantages are reviewed, and the system of effluent charges is recommended. (Gargola-Chicago)

A CURIOUS SOLUTION TO THE PROBLEM OF OPTIMAL PRICE REGULATION.
Stanford Univ, California.
James N. Rosse.
Am Econ Rev, Vol 58, No 4, pp 863-870, Sept 1968, 2 ref.

Descriptors: *Pricing, *Public utilities, Demand, Welfare (Economics), Elasticity of demand.
Identifiers: *Decreasing cost industry, Informative advertising, Paretian efficiency.

A special solution to the problem of setting an optimal price for a regulated declining cost utility is developed in this article. It is shown that intermittent average cost price regulation makes it profitable for such a utility to transmit price behavior information to consumers. Looking at the steady state analogue of an equilibrium generated by the introduction of such information, it is shown that average cost price regulation and consumer information are consistent with necessary conditions of Paretian efficiency if and only if all consumers have the same elasticity of demand for the product. Thus, the situation avoids the efficiency-redistribution dilemma of standard optimal price regulation theory. Idealized rate cards are suggested as a means of transmitting necessary information to consumers. (Seneca-Rutgers)

THE ECONOMIST'S ROLE IN WATER PRICING POLICY,
California Univ., Davis.
W. E. Johnston.
Proceedings Water Pricing Policy Conference, Report No 13, University of California Water Resources Center, pp 28-40, March 1968. 5 fig.

Descriptors: *Water requirements, Water resources development, Water demand, Water policy, *Pricing, *Elasticity of demand, Profit, Conservation.
Identifiers: Kern County Water Agency, Rationing.

In reality, use of the optimum economic criterion that marginal cost equal marginal value in use, is not appropriate for a water-supplying agency. To the firm, water is but one of several inputs. However, a public water agency's objective is commonly regarded as that of securing reliable water supplies for its members; profit maximization is not its goal. With investments of such magnitudes, as necessary for water resource development, the average cost curve usually declines throughout the range of system capacities. The appropriateness of using marginal-cost pricing when faced with a declining average cost curve is debatable. Water can be differentiated according to differences in time, place, and quality. This differentiability also makes the pricing problem more difficult. If distribution systems have a limited capacity, users must wait on a rotational system of water delivery, and this may increase the efficiency of their use of water. Variations in tax-toll mixes may provide incentives for allocation of water use to conform to district objectives. (Seneca-Rutgers)
W69-01077

WATER PRICING: A SOCIAL DECISION-MAKING PROCESS,
California Univ., Los Angeles.
Ernest A. Engelbert.
Proceedings Water Pricing Policy Conference, Report No 13, University of California Water Resources Center, pp 59-69, March 1968. 13 ref.

Descriptors: *Pricing, Water rates, Social change, *Social aspects, Water policy, *Decision making, Ethics, Aesthetics, Institutions, Water resources development.
Identifiers: Public objectives, *Behavioral sciences, Due process, *Multiple water pricing systems.

Social non-economic considerations have always permeated water policy decision-making processes. These may be categorized under four broad headings, namely (1) ethical considerations, (2) social policy considerations, (3) considerations involving due process, and finally, (4) aesthetic considerations. In actual practice, these are not so neatly categorized by our various water pricing systems, and indeed, are not easily separated. Under ethical deterents, high priority is placed upon the use and development of water for the sustenance and protection of human life; it is also considered ethically desirable to conserve resources for future generations. Among the more important social policy objectives have been the use of water to facilitate regional and national growth; to influence the spatial distribution of population, and to promote the public's general welfare. Standards of due process are the procedures whereby individual rights are secured and maintained, they consciously establish water institutions and procedures that will minimize social conflict. Aesthetic factors are involved with society's interest in using and conserving water resources to protect the beauty, quality and liability of the natural environment. (Seneca-Rutgers)
W69-01082

INPUT-OUTPUT PROJECTIONS: CONSISTENT PRICES AND QUANTITY STRUCTURES,
Cambridge Univ., Cambridge, England. Dept. of Applied Economics.
Richard Stone.
L'Industria, Vol 102, No 2, pp 212-224, April-June 1968. 6 ref.

Descriptors: *Input-output analysis, *Least squares method, Forecasting, Constraints.
Identifiers: Variance matrix, *Best linear unbiased estimator, *Price vector, *Coefficient matrix, Factors of production.

In order to construct a coherent system for the projection year, it is necessary to introduce the prices of that year as well as the quantities. If we form initial estimates of factor and product prices the resulting system is not likely to be coherent because the initial estimates of prices are not consistent with the initial estimates of the quantity structure. This paper shows how the well known method of adjusting conditioned observations in the method of least squares can be applied to the problem of making consistent input-output projections. There are three possible means of adjustment: (a) accept initial estimates of intermediate and primary coefficient matrices and adjust only product and factor prices; (b) accept initial estimates of these prices and allow the adjustment to fall on the intermediate and primary coefficients (c) adopt some compromise between these extremes. A numerical example is provided for all three cases. This method is simple and the difficulties associated with it are mainly practical. It can only be tested through applications. (Seneca-Rutgers)

6D. Water Demand

ARKANSAS WATER RESOURCES: SUPPLY, USE, AND RESEARCH NEEDS,
Arkansas Univ., Fayetteville.
Jared Sparks.
Water Resour Res Center Publ 2, 1967. 100 p, 15 fig, 10 tab, 25 ref. OWRR Project A-006-Ark.

Descriptors: *Research and development, Multiple purpose reservoirs, *Water supplies, Chemicals, Sediments, *Water pollution, Floods, *Water management (Applied), *Surface waters, *Groundwater, *Hydrologic data, *Water utilization, Water balance, *Economics, Groundwater recharge, Limnology.

The purpose of this study is to identify Arkansas water resources research needs based on economic backdrop of water supply and use conditions. Arkansas has an abundance of high quality water for present use. There are local conditions causing water problems, but, critical water problems in Arkansas are emergent and potential rather than actual. Causes of these problems are to be found mainly in the economic, legal, and social institutions surrounding water use--and particularly in the economic institutions. Research designed to improve economic efficiency criteria and to develop methods of applying such criteria to water resources planning, to water resources allocation and to quality of water control would do much to mitigate water management problems in the future. Research of this nature requires more water data concerning supply, use, and costs associated with water use than are now available. Other promising areas of research include research on the nature of water and water cycle, applied research in areas of flood control, artificial recharge, measurement of pollution damage and costs, identification and treatment of pollution, limnology of artificial lakes and the role of water resources in industry location.

LISTS OF REFERENCES AND SELECTED BOOKS BEARING ON WATER RESOURCES IN MINNESOTA,
Minnesota Univ., Minneapolis.
William C. Walton.
Water Resour Res Center Bull 4, Dec 1966. 36 p, 711 ref. OWRR Project A-999-Minn.

Descriptors: *Water resources, *Reviews, *Bibliographies, Biology, Climatology, Forestry, Geology, Groundwater, *Lakes, Streams, Water pollution, Hydrology, Water supplies, Streamflow, Sociology, *Minnesota.

This bulletin lists 711 references on water resources in Minnesota including: Biological Aspects, Climatic, Forests and Water, General Geology and Groundwater, Lakes, Land and Water, Legal Aspects, Streamflow and Floods, Water-based Recreation, Water Pollution, Water Resources, and Wetlands. Selected books bearing on the physical, biological and social aspects of water resources in Minnesota on the following subjects are also listed: Climate, Conservation,

Recreation and Wildlife, Fluid Mechanics, Groundwater, Hydrology, Lakes and Biological Aspects, Mathematical and Computer Aspects, Social-Economic Aspects, Soils-Plants-Water, Streamflow, and Water Supply and Waste Disposal.
W69-00731

EVALUATION OF WATER RESEARCH NEEDS IN ALASKA,
Alaska Univ., College.
Charles E. Behlke.
Inst Water Resour Rept, 1968. 9 p. OWRR Project A-006-Alas.

Descriptors: Water resources, *Water resources development, Climatic zones, Population, Cold regions, Permafrost, Water management, *Alaska, Evaluation, Planning, Arctic, Oil fields.

The water resource research requirements for Alaska reflect the needs of a rapidly expanding population and industrial growth in an unpopulated country. It appears that many problems which have been researched elsewhere must be restudied in Alaska because of climatic extremes. Most of the southern coastal areas of the State exhibit from 70 to 350 in. of runoff/yr and in much of the northern part of the State permafrost to great depths and seasonal frost lock virtually all water in a solid state for a major part of the year. Alaska is proving to be an area with vast petroleum reserves. These reserves are being brought into production and are resulting in development of previously unpopulated areas. The proper management of previously untouched waters requires knowledge of the nature of the existing resources and then an evaluation of the probable effects of alternative water uses in order to optimize the desirable use of Alaskan water resources. This evaluation of present conditions and analysis of future possible uses require vast amounts of research.
W69-00743

AN ACT CONCERNING USE OF WATER FROM RIVERS FOR PUBLIC CONSUMPTION.
Connecticut Public Act No 792 (1967).

Descriptors: *Water utilization, *Water permits, Administrative agencies, *Connecticut, Legislation, Water allocation (Policy), Water users, Public utilities, Public rights, Water distribution (Applied), Utilities, Water law, Legal aspects, Municipal water, Navigation, Reasonable use.

Any public water supplier is given permission to take water from any river if it applies to and receives a permit from the Water Resources Commission. The application must be consented to by a public service company if the company's rights are affected, or the Public Utilities Commission must approve the diversion. The Water Resources Commission makes an investigation, holds a public hearing, cooperates with other state agencies, and makes a determination with respect to the application. The permit may be revoked or modified by the commission if it is in the public interest to do so. Any person aggrieved by the commission's determination may appeal to the superior court. (Horner-Fla)

LITTLE WABASH RIVER BASIN STUDY, A COMPREHENSIVE PLAN FOR WATER RESOURCE DEVELOPMENT,
Illinois Department of Public Works and Buildings, Springfield Division of Waterways.
Bruce Barker, John B. Carlisle, and Raymond Nyberg.
Rep, State of Illinois, Springfield, Ill., 1967, 76 p, 29 fig, 21 tab, 36 ref.

Descriptors: Hydrology, Drainage, Irrigation, Research and development, Project planning, Financing, Administrative decisions, Soil classifications, Streamflow forecasting, Water sources, Control river basin planning, Water quality, Pollution abatement, Waste water discharge, Biological oxygen demand, Flood damage control, Federal reservoirs, Irrigation, Drainage program.
Identifiers: Well yield, Little Wabash River Basin, Louisville reservoir, Helm Reservoir, Illinois.

To provide a background for development, significant aspects of physical geography, basin economy, hydrology, and water supply are evaluated. Utilizing this information, research and recommendations are made in problem areas of water quality control, flood damage control, agricultural drainage and irrigation. Pollution problems in the basin are the result of inferior waste water treatment, high BOD loading of streams, and oil field pollution. The control of these will be mainly achieved through improved municipal waste water treatment facilities. It is recommended that flood damage control be implemented to the maximum extent consistent with economic efficiency. Measures given which satisfy these criteria are: (1) the control of urban encroachment; (2) reclamation of bottomlands; and (3) flood control reservoirs. Three proposed levee districts are recommended as the best means of achieving reclamation in the bottomlands for agricultural purposes. Since basin agriculture is becoming more important relative to total state agriculture, if it can be shown that irrigation is a good investment, these proposals should be implemented. The continued validity of the above recommendations is dependent on whether the basic data and derived relationships put forth truly represent present and anticipated future needs. If the above recommendations are implemented, the projected economic growth of the Little Wabash River Basin will not be limited. (Gargola-Chicago)

STATUS OF WATER RESOURCES USE, CONTROL, AND PLANNING IN THE UNITED STATES,
National Academy of Sciences-National Research Council, Washington, D. C.
Abel Wolman.
Journal of the American Water Works, Vol. 55, No. 1, 1963, p 1253-1272, 1 fig, 2 tab.

Descriptors: Water resources development, *Evaluation, Optimum development plans, Water supply, Water demand, Social aspects, Water allocation, *Decision making, *Project planning, Education, *Research and development, Water pollution, Hydrologic cycle, Scientific personnel.
Identifiers: International implications.

Identified are the more significant problems in the water resource field, and in areas of physical science research that will contribute to more effective use of water resources. First, the general aspects of the behavior of water in the hydrosphere are reviewed and some general problems that arise from the physical characteristics of water supply and the nature of man's demand for it. The availability of water resources in the United States today is discussed and evaluated with respect to the demands for their use. Some general problems of water resources development and allocation in arid, semi-arid, and humid areas, are discussed as to both their physical and social aspects. Unique considerations that govern the administration and use of water, such as economics and the laws related to water use are reviewed, and suggestions for their improvement made. In regard to the physical science aspects of water research specific problems are discussed and research proposals made in order of priority. Forecasting and control of channel modifications, approximation of optimum water resources systems, streamflow forecasting, weather forecasting, and study of physiologic aspects of water quality, are the research needs which have the greatest benefit for all areas. (Gargola-Chicago)

NEW LOOK AT RESOURCES POLICY,
Cornell Univ., Ithica, New York, Eng Dept.
Gordon P. Fisher.
Journal of American Water Works, Vol. 57, No. 3, March 1965, p 255-61, 2 ref.

Descriptors: Water supply, Water demand, *Water resources management, *Project planning, *Investment, Water reuse, Pollution abatement, Market value, Water laws, Riparian rights.
Identifiers: Public policy.

The water problem in the United States is not that of a widespread water shortage, but rather a water management problem. Five major factors contribute to this: (1) increasing demand for water, (2) conflicting demands for water resources, (3) concentration of demand in certain areas, (4) lack of regional management and coordination, and (5) lack of efficient organization for planning. Possible solutions to these problems are considered in areas of water costs, pollution, water laws, and reuse. In conclusion, suggestions for formulation of public policies which call for vast cooperative effort between engineers, economists, and lawyers are put forth. (Gargola-Chicago)
W69-00953

ECONOMIC CONSIDERATIONS FOR THE DESIGN OF WATER INSTITUTIONS,
Indiana Univ., Bloomington.
Jerome W. Milliman.
Public Administration Review, March, 1965, pp 284-289, 6 ref.

Descriptors: *Water resource management, Water law, *Water allocation, Marketing, Marginal product, Marginal costs, Pricing, *Economic evaluation, *Decision making, Regional analysis, Institutional constraints, Water transfer, Rates of return, Water supply, Marginal costs.
Identifiers: Marginal value, Modification of laws.

The problem of water resources appears to be not one of inadequate supply, but rather of rational allocation among competing uses. The solution lies in sensible management of resources, and in the application of economic principles in allocating existing supplies and in development of new supplies. A system of regional water management could deal more effectively with water problems than existing management methods. The fact that there are no uniform water laws results in a failure to deal with obvious externalities, and prevents development of an efficient market system. Suggestions for modifying present laws and defining the function of public agencies in the law are given. Two major economic principles: (1) equalizing marginal values in uses, and (2) marginal cost pricing are significant in water resource allocation. Ignoring the effects of these principles in water resource investments can lead to inefficient allocation of existing water supplies. Increased efficiency of water resource development lies in a merger of unapproved institutional and economic decision making frameworks. (Gargola-Chicago)

TRENDS IN WATER USE,
Partner, Pate, Hirn, and Bogue, Detroit, Michigan.
Stuart H. Bogue.
Journal of American Water Works, Vol. 55, No. 5, May 1963. p 548-54, 5 fig, 2 tab.

Descriptors: *Water use, Water rates, *Industrial use, Municipal water supply, Peak load, Water supply, *Water consumption, *Water requirements, Water distribution.
Identifiers: New York (New York), St. Louis, Pittsburgh, Washington, D. C.

Enumerated are ten factors which affect water use. Large increase in per capita consumption of water is a result of new fixtures and appliances which use greater quantities of water. Variations in demand of industrial and residential rates are discussed; from data gathered it is shown that industrial use of water tends to minimize large fluctuations in demand, while residential use does not. Relations are drawn between such factors as home value, income

LIBRARY U. OF I. URBANA - CHAMPAIGN

and water use. In conclusion, it emerges that there has been no appreciable depletion of water supplies. In fact there is no need to worry about the availability of water supplies if the citizens are willing to pay for them. (Gargola-Chicago)

RESEARCH IN GROUND WATER ECONOMICS IN THE HIGH PLAINS AREA OF COLORADO,
Colorado State Univ., Fort Collins, Econ Dept.
Paul W. Barkley.
Pap, 18th Annu Expo Natl Water Well Assoc, Columbus, Ohio, Oct 5, 1966. 10 p. OWRR Project B-007-Colo.

Descriptors: *Ground water, *Colorado, Aquifers, Economics, Water users, Irrigation, Water Development, Wells, Irrigation wells, Water wells, Groundwater mining, Pumping, *Groundwater recharge.
Identifiers: *High Plains, USA, Eastern Colorado.

This report covers ground-water resources in a crescent shaped area along the eastern border of Colorado. In 1960 this area contained an estimated 80 million acre-ft in ground-water storage with 30 million acre-ft economically recoverable. The area includes 9000 sq mi that for decades had been a dry farming area. In 1960 fewer than 400 wells yielded 60,000 acre-ft for irrigation and an additional 10,000 acre-ft was supplied by wells for other purposes. From 1961 to 1964 an average of 200 wells per year were brought into production for irrigation. In 1965, annual yields from the aquifer were slightly in excess of the estimated natural recharge of 430,000 acre-ft. This area now is confronted with the problem of declining water tables. As farm operators switch to irrigate agriculture, nonfarm economy expands. These expansions must lead to some type of control. Insufficient information exists on dollar volume of on-farm and off-farm effects to be of service to legislatures. Ground-water development must proceed through combined efforts of irrigators, business groups serving irrigators and researchers.

AN ECONOMIC ANALYSIS OF WISCONSIN'S DIVERSION PERMIT SYSTEM FOR AGRICULTURAL IRRIGATION,
Wisconsin Univ., Madison, Agri Econ Dept.
Frank H. Osterhoudt.
Water Resour Res, Final Rep, 1967. 427 p, 17 fig, 75 tab, 33 ref, 3 append. OWRR Project A-008-Wis.

Descriptors: Water laws, *Water rights, Adoption of practices, Riparian land, *Riparian rights, Irrigation, Irrigation practices, *Permits, Irrigation wells, *Irrigation permits, Wisconsin, Bibliographies.

This study was conducted to learn the parts of the diversion permit system that would affect the economic decisions of current irrigators. This was done through the study of files of the Land and Water Use Section, Dept of Natural Resources, an area study of all irrigation of E Barron County and mapping of riparian status of about 50 mi of lakes and streams. In Wisconsin, riparian land is considered to include all government lots, quarter-quarter sections, and tracts of land actually owned when less than these legal subdivisions which are actually in contact with water. In addition, such other tracts adjacent to such above-named tracts also are riparian if owned by the same person and if they have come to present ownership in an uninterrupted chain of title from the original government patent. This is known as source of title test. Among the specifications of individual permits, it was found that allocation of water for irrigation by the source of title test was the major element to affect irrigators and appeared to be particularly unsatisfactory. Perhaps this study will provide a basis of data and ideas to develop an understanding and eventually an equitable allocation of Wisconsin's water supply.

WATER USES IN THE NORTH PLATTE RIVER BASIN OF WYOMING.
Wyoming Univ, Laramie, Wyoming, Agricultural Experiment Station.
Richard T. Clark.
Research Journal 21, Agr. Exp. Stat., Univ. of Wyoming, Jan. 1967. 62 p, 1 map, 37 tab, 62 ref, 1 append.

Descriptors: *North Platte River Basin (Wyoming), *Irrigation, *Recreation, *Municipal water, *Industrial water, *Waste disposal, Demand.
Identifiers: Economics, *Water utilization.

The present uses and needs of water are described so that future uses, needs, and demand for water may be estimated. Also, the information provided in the report may be used as a basis for future projects. The paper provides a physical and economic description of the area. The uses of water for irrigation purposes, recreation, municipal, industrial, agricultural, and waste disposal are described. This discussion also describes legislation, projects, inventories, and developmental projects that pertain to the various uses of water. The potential demands for water in the areas of irrigation, recreation, residential, and industrial are estimated. After studying use of water in the North Platte River Basin, some conclusions can be reached: (1) Most tributary streams from Casper to the state line including the Laramie River are generally short of irrigation water. Some are even short in above average years. (2) Lands on North Platte tributaries in the upper reaches such as in and around Laramie lack late season water. (3) Lands along the Platte itself, especially below Casper, are not short of water in most years. (4) Most municipalities have adequate supplies for current demands but some have definite problems even in average water years. (5) There exists a demand for more water for recreational purposes. (6) Industries generally have been able to obtain enough water for their purposes. (7) More lands could be irrigated if the water were available. Under present water conditions, however, there is no extra water for irrigation in the North Platte drainage. (8) Pollution does not present a health hazard in the North Platte Basin, but in some areas it is detrimental to fishing. (Grossman-Rutgers)

STORAGE REQUIREMENTS FOR WATER IN THE UNITED STATES,
Resources for the Future, Washington, D. C. and U. S. Geological Survey, Washington, D. C.
George O. G. Lof, and Clayton H. Hardison.
Water Resources Research, Vol 2, No 3, pp 323-354, Third Quarter 1966. 6 fig, 11 tab, 9 ref, 1 disc.

Descriptors: *Water storage, *Costs, Evaporation, United States, Estimated costs, *Storage capacity, Discharge, Probability, Average costs, Marginal costs, Flows.
Identifiers: *Storage requirements, Carry-over storage, Seasonal storage, Water resource regions, Senate Committee Print 32, Net flow.

Storage requirements for various levels of streamflow regulation in the 22 major regions of the contiguous United States are presented and supersede those given in Committee Print 32 of the Select Committee on National Water Resources, U S Senate. At high levels of development, the storage required to provide the desired flow in 95 and 98 percent of the years is substantially larger than that previously given. Carry-over storage requirements based on probability routing of annual discharge are combined with seasonal storage requirements to give the revised storage requirements, which are then used to compute revised evaporation losses and revised cost estimates. The maximum net flow that could be made available for the 22 regions for 98 percent of the years is shown to be 965 billion gallons per day (bgd) for which a storage capacity of 3.6 billion acre-feet would be required. A net flow of 922 bgd could be made available with 2 billion acre-feet of storage. An increment of flow above the 922 bgd could be made available with 2 billion acre-feet of storage. An increment of flow above the 922 bgd figure would have storage costs exceeding ten cents per thousand gallons delivered. (Seneca-Rutgers)

THE EFFECTS OF VARYING LAND AND WATER USE ON STREAMFLOW REGIMEN.
Wyoming Univ, Laramie.
Paul A. Rechard, and Frederick R. Potter.
Prog Rep, Water Resour Res Inst, June 1966. 41 p, 10 fig, 5 tab, 25 ref. OWRR Project A-999-WYO.

Descriptors: Irrigation, Municipal water, *Return flow, *Streamflow, *Water rights, Water utilization, Water measurement, Consumptive use, Hydrologic budget, Hydrologic equation, *Land use, Municipal wastes, Water consumption, Water resources development, *Prior appropriation, Treatment facilities, Wyoming.
Identifiers: Laramie (Wyo.).

Urban growth in the West results in changing the patterns of streamflow in 1 or a combination of 3 ways, these are: (1) variation in consumptive use as particular areas change from irrigated agricultural land to municipalities; (2) peculiar hydrologic characteristics of urban areas that result from 'roofing over' the natural drainage basin; and (3) the effects on streamflow regimen of converting an irrigated area to dry land with concurrent transportation of the water to a municipality located many miles from the original point of use. The study of this latter effect is reported in this paper. Consumption of water by the City of Laramie and by an area north of the city irrigated from the Oasis Ditch was determined on a daily basis from May 1 until September 30, 1965. The regimen of the Laramie River was evaluated by measuring daily flows at 4 different locations during the same period. Tabular results are presented and discussed. Recommendations for further study are included.

LAKE-ORIENTED SUBDIVISIONS IN NORTH CAROLINA: DECISION FACTORS AND POLICY IMPLICATIONS FOR URBAN GROWTH PATTERNS. PART I - DEVELOPER DECISIONS,
North Carolina Univ, Chapel Hill.
Raymond J. Burby, III.
Water Resour Res Inst Rep 9, Nov 1967. 177 p, 6 fig, 18 tab, 53 ref, 4 appen. OWRR Project A-023-NC.

Descriptors: *Land development, *Community development, *Land use, Water quality control, *Environmental engineering, *Lake shores, Water zoning, Decision making, Aesthetics, Developed waters, Public health, Recreation facilities, Safety, *Lakes, Urbanization, Water policy, Watershed management, *Water properties, Water resources development.

This study examines the decisional variables which are important to developer-builders in selecting tracts of land for lake-oriented subdivisions. Public policies affecting development of these subdivisions are examined, and problems following development are considered in terms of the public interest with respect to watershed use, public safety, water quality, ownership and liability, and

ocal-state-federal regulations. The report is based on structured interviews with developers and public officials carried out during the summer of 1967. Included in the survey were 41 lake-oriented subdivisions paired with 41 nonlake-oriented subdivisions in 22 urban areas of North Carolina. An extensive series of hypotheses were tested and are reported in detail. One important finding is that the ability of developers to trade off positive values of site characteristics for environmental innovations, in order to achieve an optimum profit position, provides them with considerably more flexibility in their location decisions than has been previously thought to be the case. As the first step toward adequate control of lake-oriented subdivisions, recommendation is made that subdivision ordinances include provisions governing the use of lakes and other bodies of water in residential subdivisions.

MUNICIPAL WATER RIGHTS,
Edward F. Taylor.
AWWA J, Vol 58, No 7, pp 856-866, Jul 1966. 11 p, 49 ref.

Descriptors: Legislation, *Municipal water, Cities, Federal-State water rights conflicts, *Local governments, Judicial decisions, Water rates, Public utilities districts, Water works, Water contracts.
Identifiers: *Municipal water rights.

The lack of a clear definition of federal and local rights in water has been of deep concern to the National Institute of Municipal Law Officers. The author recommends Congressional Bill S 1275, 88th Congress, 1st Session, which requires the U S to conform to the same rules that bind other public or private claimants. When the Federal Government undertakes to appropriate water rights under state law rather than on the basis of eminent domain of navigational servitude, it must conform to the state requirements. The author cites several cases supporting the general rule that a municipality may exercise reasonable discretion in determining whether to extend its water services. Cases construing the obligations of a municipality once it extends its services to outside connections are also noted. Water contracts should be carefully drafted to prevent a construction of ambiguous terms against the drafter. Generally, there must be a clear showing that the rates set by municipal officers are unreasonable and arbitrary before they can be overruled. A municipal water authority may vary the rates among users in different classifications of consumption. But rates cannot be discriminatory within a class of users. Public Utility Commission authority over municipalities is discussed briefly. Reintroduced in 90th Congress as S 2530. (Molica-Fla)

QUIGLEY V VILLAGE OF HIBBING (RES IPSA LOQUITUR APPLIED IN CITY WATER LINE BREAKAGE).

129 N W 2d 765-772 (Minn 1964).

Descriptors: *Municipal water, *Pipelines, *Pipes, *Minnesota, Water law, Judicial decisions, Local governments, Legal aspects.
Identifiers: *Res ipsa loquitur.

This case involved damage sustained to plaintiffs' subbasement as a result of a break in a water service line, which extended from the main city line through a wall of the plaintiffs' building. The central issue in the case was whether the doctrine of res ipsa loquitur applied in a situation where water supplied commercially by a municipal corporation escaped from a line placed in a public street to carry water from a main to the premises of the user, where, after being metered, it is available for the use of the consumer. The trial court refused to apply the doctrine; but on appeal, the decision was reversed by the Supreme Court of Minnesota. After stating the criteria for application of the doctrine of res ipsa loquitur, the court recognized a division in the authority for utilizing the doctrine in a case like that before the court. However, the court concluded that upon the record the prerequisites for an application of res ipsa loquitur appeared as a matter of law. (Patterson-Fla)

H A BOSWORTH AND SON INC V TAMIOLA (DRAINAGE).

24 Conn Sup 328; 190, A 2d 506-511 (1963).

Descriptors: Eminent domain, Legal aspects, *Legislation, *Drainage, Land reclamation, Drainage effects, Surface drainage, Land development, Land use, Public benefits, Compensation, Damages, Condemnation, Judicial decisions, Water law.

The plaintiff filed a complaint seeking authorization pursuant to section 52-456 of the Connecticut General Statutes to drain land owned and being developed by it by any suitable means over or under and across the rear portion of the defendant's land. The plaintiff alleges that it has been unable to agree on the mode of drainage and the damages to which the defendants would be entitled and thus applies for power to drain its land across the defendant's land pursuant to the aforesaid statute. The defendant filed a demurrer attacking the complaint as one which contemplates a taking of property in violation of due process. The demurrer further asserts that sections 52-456 to 52-460, are unconstitutional. The court examines the history of the Drainage Act and concludes that it may be constitutional if used for the public good, but could be unconstitutional if the drainage is primarily for the benefit of the plaintiff. The court dismissed the defendant's demurrer stating the constitutionality of the Drainage Act could not be satisfactorily determined on the demurrer. (R. Smith-Fla)

GAMER V TOWN OF MILTON (PERCOLATING WATER).
195 N E 2d 65-67 (Mass 1963).

Descriptors: *Percolating water, Subsurface waters, Subsurface drainage, Recharge wells, Pumping, Soil analysis, Soil compaction, Drainage, *Groundwater, Ponds, Excavation, Recharge.

The defendant is the owner of a parcel of property known as the Turner's Pond area. The plaintiffs are the owners of residences which are adjacent to this area. The defendant entered into a contract with a contractor to excavate and remove gravel from the Turner's Pond area. In order to excavate and remove the gravel the contractor removed the water from the area by pumping it from the pond into a stream, where it flowed away. As a result of this operation water was withdrawn from the upper levels of the sub-soil causing settlement under plaintiffs' houses. This result was foreseeable to defendant. The court found the issue to be whether the contractor's procedures were negligent. The court held that there was such negligence since the contractor had not taken proper precautions to protect the plaintiffs' adjacent land. The contractor could have dug observation holes, sheathed its excavations, and used recharge wells. (R. Smith-Fla)

STATE V COCKRELL (OWNERSHIP OF BEDS AND ALLUVION).
162 So 2d 361-384 (La 1964).

Descriptors: *Louisiana, *Ownership of beds, *Accretion (Legal aspects), *Water law, Judicial decisions, Navigable waters, Streams, Lakes, Watercourses (Legal), Boundary disputes, *Boundaries (Property), Riparian rights, Water policy, Legislation.

The case involves an action of trespass brought by the State of Louisiana et al against defendants Cockrell et al, who drilled a gas well on property plaintiffs claimed to be the bed of Six Mile Lake. Plaintiffs' theory was that defendants' well was on the bottom of a lake navigable at the time of admission into the Union, and therefore the lakebottom was owned by the state by virtue of its inherent sovereignty. Defendants claimed the well was drilled on alluvion in front of defendants Zenors' property. In essence, defendants claimed that the lake was a 'river or stream' within the meaning of the term as used in LSA-CC Article 509, which provides that owners of lands adjoining rivers or streams are entitled to accretions which imperceptibly form alluvion attached to the shore. After careful examination of relevant cases and facts in issue, the court held for the defendants, stating, inter alia, that Six Mile Lake was an 'other stream' under LSA-CC Article 509 and therefore, unlike the case with true lakes having no currents, alluvion belongs to the riparian owner and not the state. (Patterson-Fla)

CULBERTSON V GROSS (SURFACE RUNOFF).
77 York 50-55 (Pa Com Pl 1963).

Descriptors: Surface runoff, Surface water, Drainage, Flooding, Drainage water, Rain water, Soil erosion, *Surface drainage, Slopes, Pipes, Artificial watercourses, Flow, Land development.

This is a dispute between adjoining land owners over the drainage of surface water. Plaintiffs by their complaint seek an injunction restraining defendant from obstructing the water flow from their land to his, and also request damages for injury to their land as a result of the consequent flooding. Defendant denied plaintiff's right to have the water flow as stated and counter claimed for an injunction restraining plaintiffs from discharging the water on to his land. The court applied the rule that one may not be artificial means gather water into a body and precipitate it upon his neighbor's property. The court concluded that both parties will have received equitable treatment if the plaintiffs reduce length of their drainage pipe and defendants accept the resulting more natural flow for absorption by his land and conveyance of any excess through his drainage ditch. Plaintiff was awarded no damages since the court found no permanent injury or reduction in the value of the land as a result of the flooding. (R. Smith-Fla)

BOETTCHER V STROCK (ALTERATION OF FLOW).
77 York 86-89 (Pa Com Pl 1963).

Descriptors: Boundaries (Property), Streams, *Streamflow, Floods, Running waters, Bank erosion, *Retaining walls, Stream erosion, Natural flow, *Alteration of flow, Storm runoff, Boundary disputes, Legal aspects.

The properties of the parties are adjacent to each other. In 1954, the immediate predecessor in title to the defendants erected a wall on a portion of the

LIBRARY U. OF I. URBANA - CHAMPAIGN

South side of the stream which forms a common boundary between the two properties. This wall changed the bank of said stream so that it was vertical instead of sloping. The defendants, after the flood of 1960, rebuilt the wall on the same concrete footer that had originally been built by Whiteacre. The position of the plaintiffs is that the defendants have, by the maintenance of the wall, produced two results, (1) increased the amount of water flowing over plaintiff's land and (2) caused the stream to change its course so as to encroach on plaintiff's land. The court in dismissing the plaintiff's complaint held that although equity has jurisdiction to grant a remedy for continuing trespass that would result from interference with the flow of the creek or flooding, no such violation had been proven as a result of the defendants conduct. (R. Smith-Fla)
W69-00751

TREADWELL V WALDEIER (COMMON LAW RULE OF SURFACE DRAINAGE).
34 Misc 2d 339, 228 N Y S 2d 390-394 (1962).

Descriptors: *New York, *Surface runoff, *Repulsion (Legal aspects), *Water rights, Water law, Judicial decisions, Surface drainage, Drainage water.

Plaintiff brought this action for an injunction to restrain defendants, sued individually and as the Board of Education of Union Free School District of the Village of Ardsley, from diverting surface drainage waters from defendant's school property into a pond to the north of plaintiff's land in which plaintiff had certain easement rights. The court distinguished the common law rule of surface drainage from the civil law rule. Under the common law rule, which is the law in New York, neither upper or lower owners hold a dominant or servient estate with respect to each other. Both have equal rights to improve their property come what may to the surface water, provided the improvements are made in good faith to fit the property for some rational use and the water is not drained into the other's property by artificial means. Although artificial means were used here, the court refused to grant the injunction because the plaintiff failed to prove an increase in the flow of water as a result of defendant's actions. (Patterson-Fla)
W69-00752

NORMANOCH ASS'N INC V DEISER (OWNERSHIP OF BEDS).
40 N J 100 190 A 2d 845-852 (1963).

Descriptors: Lakes, Lake beds, *Lake shores, Boundaries (Property), Boundary disputes, Legal aspects, *Ownership of beds, Water law, Dredging, Surveys, Mapping.

The issue which confronted the court was the question of title to the subaqueous lands in that portion of Culvers Lake adjacent to the high land undisputably owned by defendant. The court ruled that this was similar to an action of ejectment and thus the plaintiff must prove that he is the owner of the lands involved. The chain of title of both parties was examined in great detail and the court concluded the solution to the problem was in the location of the lake shore in 1905. The first accurately surveyed location of the shoreline of the water bordering defendant's lot is that furnished by plaintiff in 1959. The defendant's deed, however, contains a call for a natural monument which creates a presumption that the line as delineated by the first survey has existed in such conformation and has continued unchanged from the date of the original deed. The court held title to the bed of Culver Lake was in plaintiff and enjoined the defendant from using the waters for a dock or other sundry purposes. (R. Smith-Fla)

MANUAL ON PROBLEMS OF ACCRETION,
Frank I. Towle.
Manual on Problems of Accretion, pp 1-101, (second printing) 1959. 102 p, 5 fig, 3 map, 6 photo, 4 dwg, 7 chart.

Descriptors: *Accretion (Legal aspects), Surveys, Meanders, *Boundaries (Property), Legislation, Ownership of beds, Aerial photographs, Photography, Hydrograph, Flow measurement, Riparian rights, Islands, Beds, Navigable waters, Bank erosion, Shores, Avulsion, Hydrograph analysis.
Identifiers: Flow duration curve, Isopleth.

Appraisers, title examiners, attorneys, and engineers should find this manual useful in the evaluation of the merits of claims which involve the ownership of land formed by accretion and the examination of titles to properties abutting rivers, streams and other bodies of water. The manual includes an outline of suggested procedures for determining the historical boundaries of riparian property, and a list of the federal, state and county agencies from whom pertinent material may be obtained. It is amply illustrated and includes sketches of some of the more common methods used by the courts for the apportioning of alluvion. The manual also explains the value of aerial and ground photographs, and the application of nomographs, hydrographs and flow-duration curves to the problem of land accretion. (R. Smith-Fla)

TENNESSEE VALLEY AUTHORITY.

16 USCA Secs 831-831h-1.

Descriptors: *Tennessee Valley Authority Project, *Tennessee River, Mississippi River Basin, *Flood control, Channel improvement, *Navigation, Eminent domain, Dams, Reservoirs, Project planning, Federal government, Relocation, Legislation.

The Federal Government, for the primary purposes of controlling the destructive flood waters in the Tennessee and Mississippi River Basins and the improvement of navigation in the Tennessee River, created the Tennessee Valley Authority (TVA). TVA was vested by statute with enumerated powers to carry out its objectives. The right of eminent domain, exercised in the name of the United States, and the acquisition of real estate by purchase or condemnation, with title being taken in the name of the United States, are among those enumerated powers. Real estate thus acquired would be used for the construction of dams, reservoirs, navigation projects and other structures along the Tennessee River and its tributaries for the promotion of navigation and control of flood waters in the Tennessee and Mississippi River drainage basins. Where such construction would flood or destroy lands, easements, or rights-of-way belonging to private persons, corporations, or local governmental agencies, TVA is authorized to convey replacement land by warranty deed. Also, if such construction impairs or damages any bridge, highway or railroad structure over, across or upon the Tennessee River or its tributaries, the corporation shall compensate the owners of such structures for the cost of reconstruction, relocation or replacement. The corporation is directed, in the operation of any dam or reservoir in its possession, to regulate stream flow primarily for the promotion of navigation and control of floods. (Geraghty-Fla)

TENNESSEE VALLEY AUTHORITY.
16 USCA Secs 831h-2 to 831dd.

Descriptors: *Tennessee Valley Authority Project, Tennessee River, *Electric power, *Transmission (Electrical), Dams, Financing, *Water resources development, River basin development, Conservation, Condemnation, Transmission lines, Legislation.
Identifiers: Clinch River.

TVA, in order to avoid the waste of water power, is authorized to provide and operate facilities for the generation, transmission and marketing of electricity. Surplus electric power, not needed by TVA for the operation of locks or other structures, is to be sold to states, local governments, private individuals and corporations. There are numerous provisions regarding such sales, including provisions for the purchase or lease of transmission lines by TVA. Financing of construction projects is provided for through the use of bonds. Specific authorization is granted for the construction of Cove Creek Dam across the Clinch River, including the right of eminent domain and condemnation to acquire the necessary property. To aid in the conservation and development of the natural resources of the Tennessee River drainage basin and adjoining territory, surveys and general plans for orderly and proper physical, economic and social development of that area and to be promulgated. Construction of dams, appurtenant works or other structures affecting navigation on the Tennessee River System are prohibited unless plans for such construction are first approved by TVA. Notes and annotations are included and the publication is updated by pocket part supplements. (Geraghty-Fla)

SUPPLEMENTARY HISTORY OF TITLE OF MASSACHUSETTS TO SUBMERGED SEA LANDS,
Richard Wait.
Mass L Q, Vol 36, No 1, pp 17-26, May 1951. 10 p

Descriptors: *Massachusetts, *Ownership of beds, Political aspects, *Water law, Judicial decisions, *Boundary disputes, Federal-state water right conflicts.
Identifiers: *Ownership of seabeds, Constitutional law.

The purpose of the article is to clarify what the author believes to be a mistake of law made by the U S Supreme Court in the California case, 332 U 19. In that case, the court rejected as unsound the first premise of California's argument that the original thirteen states owned submerged lands of their shores at least to the 3 mile limit, and hence California should have similar property under the 'equal footing' clause of the Constitution. The author accuses the court of rejecting the good title of the original thirteen states to their submerged lands without discussing its muniments. He then sets forth and analyzes the documentary evidence of Massachusetts' title to her submerged lands tracing the title back as far as 1629 and continuing the chain through the present. The author also takes issue with the position of the court that prior to the 19th Century the law recognized no property in submerged offshore lands. (Patterson-Fla)

ompacts, *Federal-state water rights conflicts, ublic lands, State governments, *Ownership of eds, Legal aspects, Judicial decisions, Legislation, references (Water rights).

he development of the tidelands controversy as it ecame both a political and legal question and the nterplay of executive, legislative and judicial orces is presented. The executive and legislative spects are emphasized. The origins of the tideands controversy are discussed. The key issue was hether or not the federal government or the states r private individuals owned offshore lands rich in il resources. The Supreme Court finally resolved ne controversy in favor of the federal government. he intense political overtones of the events leadng up to the court's decisions are presented in conderable detail. The repercussions of the decisions re similarly treated. States having oil resources in ffshore lands vehemently argued for state ownerhip of these lands. Republicans and Southern emocrats supported state claim bills in Congress, ut could never muster sufficient votes to override residential vetoes. It was concluded that the 1952 lection would resolve the controversy. Eisenower favored state ownership while Stevenson avored federal ownership. (Pfeiffer-Fla)

THE DEVELOPMENT AND PRESENT STATUS OF WATER RIGHTS AND WATER POLICY IN THE UNITED STATES,
Wells A. Hutchins.
J Farm Econ, Vol 37, No 5, pp 866-874, Dec 1955. 9 p, disc.

Descriptors: *Riparian rights, *Prior appropriation, *Federal-state water rights conflicts, Navigable rivers, Interstate compacts, Groundwater, Percolating water, Legislation, State governments, Federal jurisdiction, History, Water law.
Identifiers: Interstate commerce.

In the East the riparian doctrine prevails. Some western states recognize both riparian and appropriative rights, others appropriative only. Both doctrines show weaknesses. In riparian states a difficult problem is that of the unused riparian right. The appropriative doctrine is plagued with the perpetuation of rights to specific quantities of water regardless of subsequent economic changes. Courts are reluctant to order prior appropriators to make extensive changes in long-used methods of diverting, conveying, and applying water. A new area of development is the enactment of groundwater legislation. More experience with such statutes is needed before appraising their workability. Federal water policies are derived from the commerce power. In some respects federal and state water policies conflict. Examples of coordination, however, include state control over navigability only in the absence of paramount federal control, and construction of reclamation projects with federal funds under water rights acquired pursuant to state laws. AN ACT RELATING TO TOWN ROADS AND COUNTY HIGHWAYS: AMENDING MINNESOTA STATUTES 1965, SECTION 164.07, BY ADDING A SUBDIVISION AND MINNESOTA STATUTES 1965, CHAPTER 163, BY ADDING A SECTION.

Minnesota Acts Ch 723 (1967).

Descriptors: *Minnesota, Legislation, *Roads, *Surface runoff, *Ditches, Surface drainage, Highways.

Minn Stat Sec 164.07 and Ch 163 (1965) are amended to direct that town boards and county boards, when considering petitions for vacation of roads, consider the necessity of the lateral ditches along such roads for the drainage of the adjacent lands. Where such boards find that the ditches promote the public health and welfare, they are authorized to retain the right of access to the ditches for their maintenance. Adjacent landowners are prohibited from interfering with the drainage facilities. (R. F. Williams-Fla)

PRESIDENT'S MESSAGE ON CONSERVATION AND WATER MANAGEMENT,
Lyndon B. Johnson.
U S Code Cong and Admin News, Vol 1968, No 2, pp 561-566, April 5, 1968. 6 p.

Descriptors: *Legislation, *Administrative agencies, Water pollution control, *Water pollution treatment, Water quality control, Sewage treatment, Water management (Applied), *Federal government, Standards, Arizona, Colorado, Oil wastes.

The President reviewed past water pollution and mangement legislation and the need for more programs. He asked Congress for action on proposed and pending legislation and more funds for existing programs. The President made the following recommendations: (1) An appropriation of $225 million for grants under the Clean Water Restoration Act to speed the construction of water treatment plants; (2) Legislation be passed to allow the Secretary of Interior to make annual installment payments under this act in addition to lump sum grants to permit the Federal Government to make larger long range construction commitments; (3) That a Safe Drinking Water Act which would establish minimum requirements for public drinking water be passed; (4) The establishment of a National Water Commission which was then in conference committee; (5) Authorization of the Central Arizona Project which would divert waters of the Colorado River to arid portions of Arizona; and (6) Passage of the Oil Pollution and Hazardous Substances Control Act of 1968 which would strengthen previous legislation in this area. GARBAGE DISPOSAL AND WASTE ALONG STREAMS.
Ohio Laws 1967, Ch H 152.

Descriptors: *Legislation, *Ohio, *Waste disposal, Domestic wastes, Water pollution control, Administrative agencies, Watercourses (Legal), Streams, Cities, Zoning.
Identifiers: Attorney general, Injunction.

The Act amends sections 3767.32, 3767.33, and 3767.99 of the Revised Code. Section 3767.32 now provides that no person shall place or dispose of garbage, wastes, or anything else of an unsightly or unsanitary nature in any stream, or other watercourse, except those waters which do not combine with natural surface or underground waters, or upon the bank thereof where the garbage is liable to be washed into the water. Certain exemptions are specified. Section 3767.33 provides that no zoning commission, municipal corporation, or other governmental authority, except the water pollution control board, may authorize the placing or disposal of materials in or upon the banks of such watercourses after January 1, 1968, where such disposal would be prohibited under section 3767.32. Such placing or disposal may be enjoined by the common pleas court upon application by the attorney general or other specified officers or agencies. Section 3767.99 provides penalties for violations of certain sections of the Revised Code, including a fine of not less than $25.00 nor more than $500.00, or imprisonment for not more than 30 days, or both, for violation of section 3767.32. HANDBOOK OF BASIC WATER LAW (WITH SPECIAL REFERENCE TO LOUISIANA),
Louisiana Water Resources Research Institute, Louisiana State U, Baton Rouge.
George W. Hardy III.
Handbook of Basic Water Law (with special reference to Louisiana) pp A1-A14, B1-B26, C1-C37, June 1966. 77 p, 46 ref, append.

Descriptors: *Louisiana, *Saline water intrusion, Aquifers, Encroachment, Legislation, Judicial decisions, Civil law, *Legal aspects, Groundwater.

A compilation of materials is presented to serve as a basis for the study of possible legal solutions to problems encountered in the study of salt water intrusion into fresh water aquifers in East Baton Rouge Parish, Louisiana. A memorandum discusses the present state of the water law in Louisiana to serve as a basis for seeking answers to legal problems that may arise if groundwater is water from surface streams is imported for use in the Baton Rouge area. Summaries of statutory water law are presented to compare the efforts of Cal, Colo, Fla, Ill, Ind, Neb, N J, Texas, in dealing with the problem of preservation of fresh ground water. A compilation of Louisiana statutory materials and court decisions is presented as a research tool for the evaluation of legislation or other solutions to the salt water intrusion problems in the Baton Rouge area. LIBRARY U. OF I. URBANA - CHAMPAIGN

This act creates a national program of water research. The Department of the Interior controls the Office of Water Resources Research. Funds to establish a research institute are available to each state when associated with a college in that state. These institutes conduct research and train scientists in such areas as the hydrologic cycle, supply and demand of water, water conservation, and increasing water supply. Grants are available when matched with state or other non-federal funds. Grants for research into any aspect of water problems may be given to entities other than the institute. The requirements for obtaining institute allotments and grants to other entities are provided. The Director of the Office of Water Resources Research determines whether applications for allotments, grants or contracts are to be accepted. The Act describes the fiscal and accounting procedures to be used. Various reports by fund recipients are required. Representatives of the Director and of the Comptroller General may conduct audits and inspections of all recipients of funds. (Childs-Fla)

RIVERS AND HARBORS - APPROPRIATIONS PL 90-483.

U S Code Cong and Adm News, Vol 1968, No 10, pp 3505-3528, Sept 20, 1968. 25 p.

Descriptors: *Federal government, *Grants, Navigation, *Legislation, Flood control, *Rivers and Harbors Act, Beach erosion, Basins, Federal budgets, Costs.

Appropriations for the fiscal year 1968-69 under the Rivers and Harbors Act are listed. Thirty appropriations for the improvement of navigation, exceeding $285 million, were approved. Extensive appropriations were also approved to prevent beach erosion throughout the nation. Appropriations exceeding $600 million were approved for flood control measure in thirty areas of the nation. Additionally, $466 million was appropriated for the prosecution of a comprehensive plan for the development of twelve listed basins by the Secretary of the Army. (R. H. Watson-Fla)

PAINTER V ALEXANDRIA WATER CO (TRANSFERABILITY OF FLOWAGE RIGHTS).
202 Va 431, 117 S E 2d 674-678 (1961).

Descriptors: *Virginia, Judicial decisions, *Dams, Flow control, Ponding, Competing uses, Prior appropriation, Condemnation, *Relative rights, Easements, Submergence, Water resources development, Flood plains, *Land tenure.

This was a condemnation proceeding by the water company, defendant here, under color of a deed of flooding rights, against Painter, plaintiff, grantee of Pagne. The commissioners' report favoring the water company was accepted by the trial court over Painter's objections, and Painter brought this suit. This court affirmed the decision. The deed between Pagne and the defendant's predecessor created two separate flowage rights in the former company, which vested immediately upon the deed's execution anddelivery. Since the rights had vested immediately, and were not contingent upon the happening of any future event, there was no difficulty arising out of the rule against perpetuities. The sale of such rights to the defendant at a later date was perfectly proper and the company could, under its deed, condemn certain of the plaintiff's lands. A landowner can grant to another an easement running with the land to overflow that land, and such easement is enforceable against later owners. (Blunt-Fla)

PIKE COUNTY BD OF EDUC V BELFRY COAL CORP (INJUNCTION AGAINST DRAINAGE FLOODING).
346 S W 2d 37-38 (Ct App Ky 1961).

Descriptors: Judicial decisions, *Kentucky, *Landfills, Surface drainage, *Obstruction to flow, Floods, Rainfall.
Identifiers: Injunctions, Estoppel.

Plaintiffs owned and operated a garage. Defendant Board of Education owned adjoining property. Originally the land owned by the Board had a lower elevation than the floor of plaintiffs' building. Natural drainage flowed onto the Board's property. The Board decided to build a playground in this area. This was done by filling it with dirt and rock to an elevation approximately four feet higher than the level of plaintiffs' floor. The trial court found that defendant's fill constituted an artificial obstruction to the drainage and substantially contributed to the flooding of plaintiffs' premises during rainfall. The appellate court affirmed, holding there was adequate proof that the change caused an increase in the amount of water cast upon the plaintiffs' premises. Defendant contended plaintiffs were estopped to obtain this relief because they encouraged defendant to spend money in an unsuccessful attempt to alleviate the situation. The court held that the alleged estoppel developed after the suit was filed and that plaintiffs, by insisting that certain steps be taken, were not precluded from claiming that all steps be taken which were necessary to right the wrong committed by the defendant. AN ACT TO PROTECT INTAKE OF PUBLIC WATER SUPPLY.

Maine Public Law Ch 283 (1967).

Descriptors: *Maine, Water supply, *Cities, *Intake, Legislation, Water quality, Regulation, *Utilities, Water pollution sources, Water pollution control.

Title 22 of the Maine Revised Statutes is amended by adding a new section 2437. Authorization is given to any water utility or municipality which supplies water to the public from a lake or pond to mark off an area not exceeding 100 feet in radius around its point of intake. No person shall moor or anchor a boat or carry on ice fishing within such radius. Violation of this provision is deemed a misdemeanor punishable by up to a $50 fine per offense. This act is not to be construed as affecting any private or special law granting a water utility or municipality greater controls for protection of water intakes. (R. F. Williams-Fla)

NORTH CAROLINA WELL CONSTRUCTION ACT.
North Carolina Laws 1967, Ch 1157.

Descriptors: *North Carolina, Legislation, Well regulations, *Groundwater, *Administrative agencies, Administration, *Well permits, Water conservation, Water quality, Withdrawal, Wells, Pumps.
Identifiers: Water quantity.

The Board of Water Resources is authorized to adopt rules and regulations governing the location, construction, repair and abandonment of wells, and for the installation and repair of pumping equipment. Notice and public hearings are required for the adoption of regulations. Prior permission shall be obtained from the Board for proposed wells above a certain capacity or in areas where permission is necessary to protect groundwater resources. Other general standards and requirements which the Board must follow are set out (Sec 87088). The Board is granted rights of entry and access to all property to insure compliance with its regulations. Alleged violators must be served with notice of the violation. A public hearing is required where the alleged violator requests it. The rules and procedure of such hearings are set out, judicial review is provided for, and a penalty of $100 per violation is set. The Director of the Department of Water Resources is authorized to bring suit in the name of the state to enjoin violation of this act or the Board's regulations. (R. F. Williams-Fla)

ARKANSAS LOUISIANA GAS CO V TRAHAN TITLE TO ALLUVION FORMATIONS).

158 So 2d 456-457 (La 1963).

Descriptors: *Judicial decisions, *Louisiana, *Alluvion, Rivers, *Riparian rights, Banks, Water law, Legal aspects, Relative rights.

This case was a concursus proceeding, where the plaintiff deposited in court an amount equal to the value of production from a unit well which it was operating under a mineral lease. There were rival claimants to this fund, and plaintiff desired that the court determine which claimant was entitled to the fund. The property in question, upon which the well was located, was alluvion formation from a river. One claimant contended that its title, purchased from the rival claimant, reached to the bank of the river and that therefore it owned the alluvion formation, and was entitled to the funds. The rival claimant contended that it had retained a strip of land between the river and that which it sold to the first claimant. The case was decided on a factual basis, the legal principle that alluvion belongs to a riparian owner being unquestioned. The lower court found that the first claimant owned all the way to the river bank and was therefore entitled to the funds. The Court of Appeals of Louisiana affirmed. (R. F. Williams-Fla)

MANGROVE ISLANDS AND GROWTH AS LAND - FLOOD CONTROL DISTRICT TAXES,
James Kynes.
1964 Fla Att'y Gen Rep, No 064-61, May 13, 1964. 3 p.

Descriptors: *Mangrove swamps, *State jurisdiction, *Ownership of beds, Administrative agencies, Wetlands, Beds, Submerged plants, *Florida.
Identifiers: *Trustees Internal Improvement Fund.

The question presented here was whether Mangrove Islands were submerged land or uplands; whether title thereto was vested in the State of Florida or in the trustees of the Internal Improvement Fund, and; what lands held by the Trustees within flood control districts were subject to flood control district taxes. The Attorney General replied that since mangroves could only live if their root systems were submerged by the average high tides, that such growths constituted submerged lands until such time as they gathered so much silt and sand as to be no longer covered by the average high tide, and the plants no longer remained green and growing. Since these were submerged lands, title was vested in the Trustees and would so remain even if the growths became uplands. FS 378.30 provides an exemption from flood control district taxes for bodies of navigable water and unreclaimed waters which were meandered. The Mangrove Areas involved in this opinion were within such a meandered area, and consequently the Attorney General felt they should be exempt until they became uplands. (R. F. Williams-Fla)

YOUNGSTOWN MINES CORPORATION V PROUT (OWNERSHIP OF LAKE BED).

124 N W 2d 328-354 (Minn 1963).

Descriptors: *Minnesota, Lakes, Boundaries (Property), *Lake beds, Lake shores, Navigation, *Ownership of beds, Low water mark, Navigable waters, *Mining, Legislation, State governments, Federal-state water rights conflicts, Riparian land, Legal aspects, Water law, Judicial decisions.

Youngstown, pursuant to Minn Statute 6.136, submitted to the Commissioner of Conservation a verified claim for refund of royalties it had paid the state under a mineral lease covering a portion of the bed of Rabbit Lake. The claim for refund was based on a provision of the lease respecting the ownership of the ores mined under it; the findings, conclusions, and judgment stipulated for in an action by the state to reform the lease; and a judgment, entered in a subsequent action, which determined that the state had no right, title, or interest in the bed of Rabbit Lake. The court held that clearly the state in entering into the lease with Youngstown acted not in its sovereign, but in its proprietary capacity, which subjects it to the same liability as other litigants. Under this lease, the state's right to receive royalties was conditioned upon its ownership of the lakebed. The case of State v Adams determined that the fee title to the lakebed was held by the riparian owners. The court affirmed the decision permitting Youngstown to claim the refund. (R. Smith-Fla)

D'ALBORA V GARCIA (OBSTRUCTION OF CANAL).
144 So 2d 911-916 (4 Cir Ct App La 1962).

Descriptors: *Navigable waters, *Ownership of beds, Riparian rights, Canals, Transportation, Water utilization, Water law, Legal aspects.

The plaintiff brought action to enjoin the defendant from obstructing a canal. The main question was whether the canal was navigable. The court held that evidence showing the use of the canal by boats for transportation and commerce proved the navigability of the canal. A test of the navigability of water bottoms is that those which are navigable in fact must be regarded as navigable in law, and they are navigable in fact when they are so used or susceptible to such use or are shown to be capable of commercial use. The defendant was enjoined from obstructing the navigable canal or impeding the use thereof. (Horner-Fla)

PROTECTION OF PORTS AND HARBORS.
State of Florida, Tallahassee.

Fla Stat 309 (1967).

Descriptors: *Harbors, Tidal waters, *Docks, Bays, Rivers, Rocks, Gravels, Piers, Jetties, Piles (Foundation), Bulkheads, *Riparian rights, High water mark, Sands, Mud, Navigable waters, Fish, Bridges, *Florida.
Identifiers: Ports, Wharves, Ballast.

This chapter of the Florida Statutes makes it unlawful to deposit any material in the waters of any bay, port, harbor or river of the state except as so provided. It also prohibits the deposit of any material on a wharf which may wash into the surrounding waters. This chapter provides for the deposit of clear stone and large rocks for use in the construction of wharves, piers, quays, jetties, or bulkhead. It also allows the deposit of any material behind permanent bulkheads which will not allow the material to flow into the protected waters. It goes on to list minimum standards for these bulkheads. Provision is made that nothing in this chapter will be construed to interfere with any rights or privileges previously enjoyed by riparian owners. Exception is also made to allow Escombia, Manatee, and Pinellas Counties to deposit such materials adjacent to bridges as are required to improve fishing. (R. H. Watson-Fla)

WESTON DRILLING COMPANY V TUPPER (OIL LEAKAGE AND WATER POLLUTION).

139 So 2d 361-364 (Miss 1962).

Descriptors: Mississippi, Judicial decisions, *Water pollution, *Soil contamination, *Oil, *Pipelines, Pastures, Cattle, Streams.
Identifiers: Ranches.

LIBRARY U. OF I. URBANA - CHAMPAIGN

This case concerned water pollution caused by breakage of defendant's oil pipe line on land adjoining plaintiff's ranch. The defendants were held liable for being negligent in maintaining the pipeline and failing to prevent the damage to plaintiff after being notified of the oil leakage. The res ipsa loquitur doctrine was applied against defendant in holding it liable. (Crabtree-Fla)
W69-00805

TRUSTEES INTERNAL IMPROVEMENT FUND--AUTHORITY TO CONSTRUCT DOCKS, PIERS, WHARVES AND SIMILAR STRUCTURES,
Richard Ervin.
Rep Att'y Gen Fla 059-241 Nov 25, 1959.

Descriptors: *Florida, *State jurisdiction, State governments, Legislation, Navigable waters, Riparian rights, Ownership of beds, *Docks, Piers, *Coastal structures.
Identifiers: *Purprestures.

This opinion was requested by the director of the Trustees of the Internal Improvement Fund. He asked what authority the Trustees had in regard to the construction of docks, piers and similar structures in the navigable waters of the state, and if approval was required for each structure or if the Trustees could regulate such construction by the issuance of rules and regulations. The Attorney General replied that there is no statutory authority for riparian or littoral owners to construct docks or wharves into navigable waters, and also according to the common law a wharf was a purprestures, subject to sovereign control. Since the trustees are to administer and control all sovereignty lands, title to which is not vested in some other state agency, it is necessary for upland riparian owners to secure approval of the Trustees before constructing docks or wharves into navigable waters. The trustees may adopt rules and regulations for the construction of docks and wharves in particular areas, allowing their construction without individual permits. However, in the absence of such regulations, specific approval of the Trustees is necessary. (R. F. Williams-Fla)
W69-00806

PARKS V SIMPSON (SHELL DEPOSITS).

137 So 2d 136-141 (Miss 1962).

Descriptors: *Mississippi, *Judicial decisions, Oysters, Shoals, *Legislation, Dredging, Tidal waters, *Ownership of beds.
Identifiers: Public trust doctrine.

In a question turning on statutory construction, the Mississippi Supreme Court held that the provision in the 1960 seafood laws that the Mississippi Marine Conservation Commission, for the purpose of growing oysters, may acquire and dispose of shell seed oysters and other materials did not pertain to shell deposits of dead oysters. The commission acted ultra vires in entering a contract for the sale of shell deposits to which the state holds title as trustee for the people. By decree the court invalidated the contract and enjoined its performance. (MacMillan-Fla)
W69-00807

VAN SZYMAN V TOWN OF AUBURN (DRAINAGE - EASEMENTS).

188 N E 2d 453-460 (Mass 1962).

Descriptors: *Massachusetts, *Drainage, Surface drainage, Drainage effects, Drainage water, *Easements, Water law, Repulsion, Drainage systems.

Plaintiffs appealed from a decree which adjudged that the town of Auburn owns three easements of drainage into the plaintiffs' land, and that the owners of the adjoining land have an easement of flow in one of these drains. The plaintiffs bought the parcel of land from the Whites in 1957. They knew of none of the drains prior to the purchase. The court discussed the facts surrounding each of the drains and concluded that concerning drain number 1 and 2, the Whites were not consulted about the installing of the drain, gave no written or oral permission at any time and never granted an easement to the town. The Whites created an implied easement of drainage appurtenant to the adjoining land and the plaintiffs may not block the flow of this drain. The court reversed the decree of the lower court. (R. Smith-Fla)

PUBLIC PROPERTY, TAXATION OF UPLAND ADJOINING SUBMERGED LANDS - RIPARIAN RIGHTS,
Richard Ervin.
Rep Att'y Gen Fla, 059-188, Sept 16, 1959.

Descriptors: *Riparian rights, Tidal waters, Legislation, *Beds, *Taxes, Legal aspects, *Florida, Administrative decisions.
Identifiers: Upland, Tax deed, Equity.

The Attorney General answered the question, where upland, adjoining submerged lands sold and conveyed by the trustees pursuant to Florida Statutes section 253.12 is taxed and a tax deed is issued pursuant thereto, without the taxation or sale of the said submerged lands, does the purchaser under the tax deed acquire riparian rights, in the negative. The Attorney General cited Caples v Taliaferro, 144 Fla 1, 197 So 861, for the rule that a riparian owner may separate his uplands from his submerged lands and convey both to different grantees or he may sell one and withhold the other. The owner of the submerged lands, notwithstanding the tax deed in question, has the right to fill his said lands. The purchaser under the tax proceeding has his remedy in a court of equity to determine his rights under the tax title. (R. H. Watson-Fla)

CHESARONE V PINEWOOD BUILDERS INC (DRAINAGE SYSTEM).

186 N E 2d 712-716 (Mass 1962).

Descriptors: Eminent domain, Surface water, Damages, *Massachusetts, *Drainage system, Land development, *Artificial watercourses, Water law, Watercourses (Legal), Ditches, *Surface runoff, Rain water, Drainage, Drainage water, Flooding, Surface drainage.

This case dealt with a bill in equity to enjoin the defendants from discharging and throwing water in an artificial stream on the land of the plaintiff and for damages. In 1959 and 1960, the defendant developed his land for several hundred housing units. Defendant, with the approval of the planning board of Framingham and the permission of the town engineer graded his land so that it gradually sloped in a descending plane toward plaintiff's land. The defendant also installed a surface water drainage system which caused all of the surface water from the area to be collected into the drains and then discharged onto the plaintiff's land. The court granted plaintiff's request for damages on the basis that there never was any natural watercourse from defendant's land running over the plaintiff's land. The court found that the cost of correcting the conditon by a proper drain under the plaintiff's land was $28,130.60. There were other innocent parties involved and the court remanded the case for further investigation as to whether injunctive relief should be granted. (R. Smith-Fla)
W69-00811

REQUIREMENT FOR ESTABLISHMENT OF BULKHEAD LINE AS PREREQUISITE TO SALE OF SOVEREIGNTY OFFSHORE AREAS,
Richard Ervin.
Rep Att'y Gen Fla 059-217, Oct 27, 1959.

Descriptors: *Florida, *Islands, State governments, State jurisdiction, *Bulkhead line, *Coasts, Navigable waters.

This opinion was in response to a question from the Director of the Trustees of the Internal Improvement Fund. He asked if it was a necessary prerequisite to the purchase of unsurveyed offshore islands by private parties, that the purchaser first procure the establishment of a bulkhead about such island. The Attorney General replied that the purpose of the bulkhead provisions was to provide and exterior boundary beyond which no sales could be made and no filling take place. The establishment of a bulkhead is necessary, whether extensions into open water are contemplated or not. He concluded that the establishment of a bulkhead could be made a prerequisite to purchase of offshore islands from the Trustees of the Internal Improvement Fund. (R. F. Williams-Fla)

WINSTEAD V DICENZO.
185 A 2d 304-306 (RI 1962).

Descriptors: *Judicial decisions, *Rhode Island, *Riparian rights, Relative rights, *Docks, Legal aspects.
Identifiers: Injunctions.

Winstead, the complaintant, owned land on the bank of a cove, and had erected a wharf out into the cove in connection with his fishing business. When another landowner (DiCenzo), on the same side of the cove, petitioned state officers for permission to build a similar wharf not far from Winstead's, he objected. Permission was granted over Winstead's objection, and he then sought an injunction against DiCenzo and the State officers to prevent construction of the wharf, on the ground that such construction would permanently obstruct his access to his wharf. The lower court dismissed the suit and the Rhode Island Supreme Court affirmed. The court said that the mere finding of inconvenience to complaintant did not constitute substantial deprivation of complaintant's wharf warranting an injunction. (R. F. Williams-Fla)

BRANCH V OCONTO COUNTY (CONDEMNATION).

13 Wis 2d 595 109 NW 2d 105-110 (1961).

Descriptors: Legislation, *Wisconsin, *Navigable waters, Eminent domain, State governments, Local governments, *Ownership of beds, Boundaries (Property), Riparian rights, *Condemnation, Right-of-way, Legal aspects, Beds under water, Ducks (Wild), Hunting, Water resources development, Game birds, Waterfowl.

The lake in question affords no fishing or swimming opportunities, but is excellent for duck hunting. Appellant Branch acquired the property surrounding the lake and only permits access to the lake for a fee. The county was able to purchase land from another owner for a road to the edge of Branch's property. The county board then voted to condemn a piece of land 50 feet wide across Branch's property. It was conceded that the board's purpose was to provide access to the lake for duck hunters. The State of Wisconsin holds the beds underlying navigable lakes in trust for the enjoyment of all citizens and hunting is one of the recognized public purposes for which any navigable water may be used. The court affirmed the circuit court's decision upholding the condemnation action and denying Branch damages to compensate him for the loss of the right to exclude the public from the lake. (R. Smith-Fla)

he case involved a petition under Minnesota tatute 106.501 for the improvement of a drainage itch by constructing an open ditch to replace the riginal tile ditch. The petition was granted by the istrict Court. The appellants maintain that since ie new ditch would depart from the old tile ditch various points and take a sharply different ourse, it is not an improvement but a new open itch, the establishment of which is governed by linnesota Statute 106.031. The court held that the etition for improvement of an existing tile ditch by onstruction of an open ditch deviating at some oints from the existing ditch but not involving rainage of any new lands, which met the require-ents of 106.501 was sufficient. escriptors: Condemnation, *Condemnation alue, *Eminent domain, Compensation, Water w, Judicial decisions, *Dam construction, *Ar-ansas, Dams, Damsites, Reservoirs, Cities, Reser-oir sites, Land appraisal, Market value.

ecause of a severe water shortage, the city elected o negotiate with a certain landowner to secure his roperty for the construction of a damsite to sup-lement the city's water supply. The owner granted ie commission permission to take possession of ie lands needed for the dam's construction, but hen further negotiations failed to bring about an greement on price the commission entered into ondemnation proceedings. Compensation was ac-ordingly set. On appeal the owner alleged that ompensation was insufficient and that the value of ie land should be based upon its availability as a amsite and reservoir. The City argued that the wner should not be allowed to value his property or the very purpose for which the city wished to ondemn it. The court held that the owner had the ight to obtain the market value of the land based pon its availability for the most valuable purpose or which it could be used, whether presently used or the purpose or not. The owner was correct, herefore, in requesting compensation based upon he market value of his land as a damsite, even hough it was presently being used for agricultural urposes. (Kuder-Fla)

GAVETTI V WATSON (LIABILITY FOR MAINTAINING ARTIFICIAL LAKE).
49 Del Co 240-252 (Pa Com P1 1962).

Descriptors: *Judicial decisions, *Pennsylvania, *Confined water, Groundwater, Percolating water, *Percolation, Pervious soils, Seepage, Water law, Legal aspects, Damages.
Identifiers: Artificial lakes.

Plaintiff landowners brought suit against their neighbor, Watson, who owned land opposite a road, asking for an injunction and damages. The land naturally sloped from defendant's property to plaintiff's and plaintiff claimed that by enlarging an artificial lake on his property, defendant caused flooding and damage to plaintiff's property. The court found that the swampy, wet condition on the front of plaintiff's property was due to seepage through the dam at one end of the lake and under the road. This seepage was caused by the great water pressure exerted upon the dam and lake bottom by the volume of water contained in the lake, and such seepage was discontinued by drainage of the lake. The court held the defendant negligent because he built and maintained such a large lake without an impervious bottom, and granted the injunction and entered a judgment for damages. (R. F. Williams-Fla)

BANKS V MASON (ATTRACTIVE NUISANCE).

132 So 2d 219-222 (2d DCA Fla 1961).

Descriptors: *Swimming pools, *Drowning, Swimming, Ponds, Streams, *Florida, Artificial watercourses.
Identifiers: *Attractive nuisance doctrine, Trespass, Negligence, Artificial waterbodies.

The plaintiff's three year old son drowned in the defendant's pool and the plaintiff sought recovery under the attractive nuisance doctrine. The court discussed the doctrine and held that the owner of artificial lakes, fish ponds, mill ponds, gin ponds, and other pools, streams and bodies of water are not guilty of actionable negligence unless they are constructed so as to constitute a trap or unless there is some unusual element of danger lurking about them not existent in ponds generally. Swimming pools normally present no hidden danger and the plaintiffs did not allege that the pool constituted a trap or some unusual element of danger. Plaintiff's case was therefore properly dismissed. (Horner-Fla)

BLAKE V U S (RIGHTS TO OYSTER BEDS).

295 F 2d 91-98 (4 CCA 1961).

Descriptors: *Navigable waters, *Federal government, *Ownership of beds, Navigation, Military aspects, Admiralty, Eminent domain, Water law, Legal aspects, Commercial fishing.

The libellants sued in admiralty to recover compensation for the taking of certain oyster beds leased by them in the bed of the York River in Virginia and for damages because of the removal of stakes and buoys in the oyster beds. The court held that the numerous stakes and buoys located in the natural navigable channel of the river were obstructions to navigable capacity and the removal of the obstructions was an improvement of navigation which served not only the purposes of the Navy but the members of the general public who made use of the stream. So long as the general interests of navigation are served, it is irrelevant that special interests of the United States are also advanced. The U S was in the exercise of its dominant power to regulate and control navigation and was privileged to appropriate without compensation. (Horner-Fla)

SIESTA PROPERTIES INC V HART (OWNERSHIP OF LAND FORMED BY HURRICANE).
122 So 2d 218-224 (2d DCA Fla 1960).

Descriptors: *Accretion (Legal aspects), *Avulsion, *Ownership of beds, Boundaries (Property), Real property, Riparian rights, Riparian land, Gulf of Mexico, Hurricanes, Islands, Water law, Legal aspects, *Florida.

The plaintiff owned land on a peninsula off Siesta Key in the Gulf of Mexico. His land was directly across a pass from the defendant's land, located on the Key. A hurricane caused a part of the plaintiff's land to shift and fill in the pass between their property. In a suit to quiet title, the lands were held not to belong to either party. The lands were held not to be accretion and thus the defendant did not gain ownership of the property. The court further held that a landowner's property lines are not enlarged to an extent necessary to take in the new land formed when a part of his land is suddenly and perceptibly deposited upon or against the shore of another riparian owner or upon the bed of an intervening tidal pass belonging to the state. Boundaries do not change when the loss of land occurs by avulsion. Thus, the plaintiff lost the land when it strayed from his boundaries. (Horner-Fla)

BOROUGH OF FORD CITY, PENNSYLVANIA V UNITED STATES (NAVIGATION SERVITUDE AND MUNICIPAL PROPERTY.
213 F Supp 248-255 (DC Pa 1963).

Descriptors: *Navigable waters, *Federal government, Cities, *Eminent domain, Judicial decisions, Condemnation, Damages, Legal aspects, Ownership of beds, Watercourses (Legal), Riparian land, *Water law, Riparian rights.
Identifiers: *Navigation servitude.

Plaintiff brought an action for damage, based on a special act of Congress, for harm to plaintiff borough's sewerage system, brought about by construction of a lock and dam by the U S Government. Plaintiff claimed the damage was caused by the construction raising the ordinary high-water mark and pool level of the river. The court held that the system was private property within the Fifth Amendment, and thus the U S was liable for damage. Defendant claimed that it was not liable because the damage was caused in the course of an exercise of the navigation servitude. This doctrine allows the federal government to appropriate property without compensation when exercising its power over navigable waters in the interest of commerce. Exercise of this power below the high-water mark is not a taking of a private property right. In addition, if land above the high-water mark is damaged, value attributable to its riparian location is not recoverable. But the court found that the water was raised above the high-water mark, and that the riparian location of the injured property was not a factor in its value. (Patterson-Fla)

Descriptors: *Arkansas, *Judicial decisions, *Drainage districts, Drainage effects, Legislation, *Land tenure.

The Arkansas Supreme Court held that two landowners, who signed a petition for formation of a drainage and irrigation district, were not entitled to have their names removed. The remonstrants moved to have their names withdrawn only after a great deal of work had been done and expense incurred in connection with the project which, the court found, would benefit them indirectly. In the absence of claims of fraud, deceit or misrepresentation in obtaining the signatures, the signatures could not be removed at this point. (MacMillan-Fla)

DAY V MUMMEY (STORM DRAINS).
200 N E 2d 785-787 (1963).

Descriptors: Storm runoff, Surface runoff, Rain water, *Ohio, Floods, *Storm drains, Surface drainage, Cities, *Drainage systems, City planning, Diversion, Land development, Sewers.

This is an appeal on questions of law and fact from trial court's order enjoining the levy of special assessments for storm sewers against plaintiff's properties. The undisputed testimony was that since the installation of a 24 in. storm sewer in 1932, no flooding had occurred on Center Street. Counsel conceded that there had been no appreciable further development of the properties fronting on Center Street that would produce acceleration of water flow there. The court affirmed the decision and held that the claim depends essentially on the effects of acceleration and diversion of the uplands water flow as building occurs and hard surfaces and roof tops promote more and faster runoff at points upgrade from plaintiffs' properties. The individual lower property owner has no obligation to take any such increase of surface water where diversion and acceleration are factors. The city is precluded from assessing any portion of the cost of the 1958 storm sewer upon lands of plaintiffs because these lands were already provided with an adequate sewer. (R. Smith-Fla)

STEINEM V ROMNEY (TITLE TO SANDBARS WHICH GROW BY ACCRETION).
233 Md 16, 194 A 2d 774-778 (1963).

Descriptors: Maryland, Judicial decisions, *Sandbars, *Accretion (Legal aspects), *Ownership of beds, *Riparian land, Navigable waters, Recreation, Storm runoff, Storms.

This was an action with respect to title to a sandbar. The sandbar in question was initially completely submerged in a navigable river and has not attached to the river banks. Because of storms and changes in the river flow it grew by accretion. This growth was lateral in nature so that the sandbar grew in front of plaintiff's property and finally attached itself to defendant's land, which was adjacent to plaintiffs land on the same side of the river. Defendant claimed title to the entire sandbar because it was attached only to his land and not to plaintiffs. It was held that plaintiffs held title to that accretion in front of their property because of their right of access to the river. (Crabtree-Fla)

UNITED STATES V PERMA PAVING CO (OBSTRUCTION OF NAVIGABLE RIVERS).
332 F 2d 754-758 (2nd Cir 1964).

Descriptors: New York, Judicial decisions, *Navigable rivers, *Riparian land, *Land fills, *Mud flows, Bank erosion, Shore protection, Damages, Dredging, Obstruction to flow.
Identifiers: Bronx River.

This was an action by the United States to recover costs it had incurred in dredging from the navigable channel of the Bronx River a shoal which resulted from the misuse of riparian land owned by New York City. The city permitted its lessee to use land along the river as a storage for fill. The city determined that twenty feet of fill could be supported by the land. However, the filling operation caused the riparian land to slide into the navigable channel of the Bronx River. The United States removed the mud slide and recovered costs from the city and from the lessee. (Crabtree-Fla)

The plaintiff brought petitory action against the defendant, who was in possession of a batture on the Mississippi River. The batture was conveyed to the defendants' predecessor in title and later the riparian lot on the river was conveyed to the plaintiff's predecessor in title. The plaintiff claimed that future accretions could not be conveyed, that the batture did not exist at the time of the conveyance to the defendants predecessor, and that the batture belonged to him as accretion to his land. The court held that even if future accretions cannot be sold separately from the riparian estate, the plaintiff did not prove the non-existence of the batture at the time of the sale. (Horner-Fla)

HUGUENOT YACHT CLUB V LION (UNDERWATER AND RIPARIAN RIGHTS OF ADJOINING UPLANDS OWNERS).
43 Misc 2d 141; 250 N Y S 2d 548-556 (1964).

Descriptors: *New York, *Judicial decisions, *Riparian rights, Competing uses, *Marinas, Docks, Bulkhead line, *Boundary disputes, Navigable waters.

A yacht club sought to enjoin a commercial marina boatyard operator from using a floating dock near the club's dock and for removal of the floating dock on grounds of zoning ordinance violation and of trespass upon club's underwater and riparian rights. A prior action established that there was no zoning ordinance violation, the defendant possessing the right to continue to use his land for boatyard as a non-conforming use the structure complained of being incident to that use. The Supreme Court determined that club and operator had established their common underwater boundary as being their upland property line extended to the bulkhead line. Under law of riparian rights prior construction and long use of a dock gave the club no right to continue use of the west side dock or to prevent operator from making full use of his riparian rights by construction of a float on a part of lands under water in front of his upland. (MacMillan-Fla)

COMMONWEALTH V HENDERSON COUNTY (DEPLETION RIGHTS UNDER RIVER BED).
371 S W 2d 27-35 (Ky, 1963).

Descriptors: Ohio River, *Ownership of beds, *Patents, *Leases, Oil, Natural gas, Public lands, Boundaries (Property), Local governments, State governments, *Withdrawl, Kentucky, Low water mark, Rivers, Beds.

The discovery of oil and gas under the bed of the Ohio River between the thread of the stream and the Indiana shore gave rise to this case. Claimants to these rights are: the counties bordering the area and their lessees; those claiming under state patents; and claimants under a lease executed by the State Property and Building Commission. The border of Kentucky extends to the north northwest low water mark of the Ohio River while an individual Kentucky landowner only owns to the thread of the river. The state controls the northern or northwestern side of the river and its disposition of these rights involves three statutes: the Patent Statutes; the County leasing Statute; and the Building Commission Statute. It was held that the patentees of this land had no claim because this portion of the state's land was not encompassed by 'vacant and unappropriated' land referred to in the Patent Statute. Lessees of the Building Commission also do not take because the statute does not expressly repeal the counties' historical control over these lands. County lessees do take as the right to

cute depletion leases is implied from the statute. McDermott-Fla)

IIANUS REALTY COMPANY V GREENWAY RIPARIAN RIGHTS).
93 A 2d 713-716 (S Ct Err Conn 1963).

Descriptors: High water mark, *Riparian rights, Boundaries (Property), Navigable waters, Watercourses (Legal), Water law, *Connecticut, Bulkheads, Marinas, Tidal marshes, Land reclamation, Ownership of beds.

This action involves a parcel of land on the easterly ide of a cove on the Mianus River. In 1937, the ailroad owned the cove and Greenway owned the and on the westerly side. Both parties then had full iparian rights in and to the land below the high vater mark in front of their respective premises. Greenway and the trustees of the railroad entered nto a written agreement establishing a division line etween their properties beyond which neither arty would claim riparian rights or make land by illing in. This line was delineated on a map atached to the agreement. The title passed through arious persons and is presently in Harrison. The ourt examined the deeds granted from the railroad nd concluded that the present owner had no iparian rights since the land had been filled and a ulkhead erected on the 'Line of Ultimate Filling' s delineated on the map. REINHART V LANCASTER AREA REFUSE AUTHORITY (WELLS-WATER POLLUTION).
201 Pa Super 614, 193 A 2d 670-676 (1963).

Descriptors: *Pennsylvania, Wells, *Water wells, Streams, Groundwater, Water table, Inflow, Percolating water, *Water pollution, *Waste dumps, Liquid wastes, Land, Garbage dumps, Pollutant identification, Reasonable use, Judicial decisions.

This action arose as a result of filling operations on and owned by defendant McFalls and leased by him to the other defendant, Lancaster, for the purpose of dumping refuse thereon. Plaintiffs are appealing the grant of a judgment n o v for the defendants following verdicts for money damages in plaintiffs' favor in two actions of trespass brought for contamination of wells located on their respective properties. The court here reversed the judgment and held that the defendants, in bringing polluted material, particularly items such as garbage, red paint, etc, which might permeate the earth and resist filtration, failed to use due care in handling such material when they placed it in close proximity to plaintiffs' land and wells, of which they were aware, and into excavations they had made below the surface of the land, even below the water level of a stream running through the land, and then compressing it into the ground by running trucks over it. Since they had received general warnings about the results of this operation, the effect on the percolating waters was reasonably foreseeable. (R. Smith-Fla)

CRUTCHER V CRAWFORD LAND COMPANY (LEGISLATION).
138 S E 2d 580-584 (Ga 1964).

Descriptors: Water law, Surface water, Land development, Surface drainage, *Legislation, State governments, Surface runoff, *Georgia, Judicial decisions.

This is an alleged trespass and damage suit case resulting from the alleged increasing of the flow of surface water upon the property of the plaintiff by the defendants. The case dealt on a procedural point concerning the 'voluminous petition' submitted here which named several defendants and in the most general terms charged numerous acts without causal connection or common wrong. The court here affirmed the lower court's decision granting a summary judgment in favor of the defendant. It was held, inter alia, that allegations of cutting trees, debris and underbrush and excavating and landscaping land, thereby increasing the flow of surface water on plaintiff's land, were insufficient, as defendants had a right to do all these things to their respective properties. (R. Smith-Fla)

HIGH KNOB, INC V ALLEN (WATER CONTRACT).
205 Va 503; 138 S E 2d 49 (1964).

Descriptors: *Judicial decisions, *Virginia, *Water contracts, Contracts, Supply contracts, Domestic water, Water supply, *Water works.

Allen entered into a written sales contract with High Knob, Inc, to purchase a residential lot. It was provided in the deed that no method of taking water from the ground could be used. There was an oral agreement that High Knob would allow Allen to hook on to its water system for a $200 fee. Allen then constructed a home and hooked on to the water system. However, the company refused the $200 payment and provided a contract with other terms than the oral agreement. When Allen refused to sign, his water service was cut off. Allen sought a permanent injunction to force the company to comply with the terms of the oral agreement. After dealing with various parol evidence problems, the trial court granted the injunction. High Knob appealed and the Supreme Court of Appeals of Virginia affirmed, holding that the company had to furnish Allen with a reasonable quantity of water. (R. F. Williams-Fla)
W69-00848

NANCE V TOWN OF OYSTER BAY (TITLE TO SUBMERGED LANDS).
244 N Y S 2d 916-926 (1963).

Descriptors: *Judicial decisions, *New York, *Ownership of beds, Beds under water, Navigable waters, *Bays, Dredging, Proprietary power.
Identifiers: *Trespass.

This case involved a controversey over title to the bed of Cold Spring Harbor. The Town of Oyster Bay, on the one side, and the Town of Huntington on the other, both claimed title to such bed, and the U S Dredging Company claimed that title was in private owners. The company, under a contract with Huntington dredged the bottom of the Harbor. Oyster Bay, through a taxpayer, brought an action in trespass against Huntington and the company. The court found it necessary to construe the old colonial charters to decide if they granted title to underwater land. In regard to the company's claim, it found that since there was no presumption that deeds to uplands carry title to submerged lands, in the absence of express words to such effect in deeds from Oyster Bay, title to submerged lands never passed to private owners. The original grant to Huntington extended only to the high-water mark on its side of the bay. The court then proceeded to hold that prior decisions had established title to the bottom of the bay in Oyster Bay and the company had trespassed thereon. (R. F. Williams-Fla)

GRANTS TO RIPARIAN OWNERS.

Fla Stat Ch 271 (1967).

Descriptors: *Florida, Oysters, *Riparian rights, Ownership of beds, Beds under water, Boundaries (Property), *Legislation, Water law, Legal aspects, State governments, Highwater mark, Navigable waters, Riparian land, Relative rights, Low water mark, Channels.

Riparian rights are those incident to land bordering upon navigable waters. They are the rights of ingress, egress, boating, bathing, fishing and such other rights as may be defined by law. Such rights are not of a proprietary nature and are appurtenant to and inseparable from the riparian land. The trustees of the internal improvement trust fund are authorized to grant to riparian owners perpetual easements, or easements, licenses and leases for a specified term of years permitting such riparian owners to construct and maintain structures on, in and under the bed of any navigable stream or river owned in whole or in part by the state. This chapter does not apply to lakes except tide water lakes and nothing contained in it should be construed as a release of the title of the state or any of its grantees to any swamp or overflow lands. The state reserves the ownership of all natural oyster beds upon and all minerals and oils in the submerged lands until they are filled in and improved by the riparian owners. (R. Smith-Fla)

BROWN V ALABAMA POWER CO (OBSTRUCTION TO FLOOD EASEMENT).
156 So 2d 153-157 (Ala 1963).

Descriptors: *Judicial decisions, *Alabama, *Easements, Floodwater, Obstruction to flow, Relative rights, Legal aspects, Water law.
Identifiers: Injunctions, *Easement to flood.

Plaintiff Alabama Power Corp purchased a tract of land in fee simple and also purchased an easement to flood adjacent land from the same parties. Subsequently plaintiff's grantors sold the adjacent land, subject to the easement, to defendants. The defendants constructed a dwelling house and proposed to fill a portion of the land to exclude flood water therefrom. Plaintiff sought an injunction to forbid defendant from constructing and maintaining the dwelling house and from interfering in any other way with plaintiff's easement over the property. The trial court granted the decree prayed for, and the Alabama Supreme Court affirmed. A person who takes land subject to an easement must not interfere with dominant owner's enjoyment of such easement. If such were allowed, the servient owner could nullify the easement. (R. F. Williams-Fla)

CONSTRUCTION OF SEC 253.0013 (2) F S,
Florida, Office of the Attorney General, Tallahassee.
Richard Ervin.
Rep Fla Att'y Gen 060-111, June 30, 1960.

Descriptors: *Florida, Bulkhead line, Navigable water, *Landfills, Land forming, State jurisdiction, Legislation, Federal government, *Administrative decisions, Public rights, *Permits.
Identifiers: Florida Bulkhead Law, Corps of Engineers.

This opinion was in response to five questions from the Director of the Trustees of the Internal Improvement Fund which were concerned with construction of Fla Stat 253.0013 (2). That statute authorizes an exception to the application of the bulkhead law for persons who hold fill permits granted by the U S Corps of Engineers prior to June 11, 1957. The Attorney General replied that since this was an exception to a statute, it must be strictly construed, and that the holder of an unexpired U S permit, who is otherwise qualified under 253.0013 (2) may fill without advertisement for objections as required by the bulkhead law. A U S permit expired or extended subsequent to June 11, 1957 does not meet the requirements of the exception. Changes in bulkhead lines after June 11, 1957 will not affect

LIBRARY U. OF I. URBANA - CHAMPAIGN

rights under U S fill permits, and such permits are not personal to the holder, but run with the land. Any change in the provisions of the permit, such as extention of time or area covered, will disallow the holder of such permit to be exempted from the requirements of the bulkhead law. (R. F. Williams-Fla)

CONOLEY V NAETZKER (TITLE CHALLENGE TO RECLAIMED LAND).

137 So 2d 6-10 (2d D C A Fla 1962).

Descriptors: Judicial decisions, *Florida, Riparian rights, *Reliction, Accretion, *Boundaries (Property), *Land reclamation, Dry beds, Lakes, Drainage effects, Drainage wells, Navigable waters.

Judgment for plaintiffs in an ejectment action was affirmed on appeal. The land in question was a lake bottom and the cause was mainly tried on the issue of what had caused the lake to recede. The defendants claimed title by the doctrine of reliction, asserting that the water receded gradually and the land thus formed a natural accretion to the land to which they hold title. The plaintiffs' contention was that the recession of the waters was perceptible and accomplished by drainage, thereby rendering the lake bed reclaimed land which vested in the state. The court, not reaching the question of reliction, affirmed the lower court's ruling that the finding by the Trustees of the Internal Improvement Fund that the subject land was reclaimed lake bottom was not subject to collateral attack in a suit between private parties in the absence of a showing of an abuse of discretion or that defendants were never afforded an opportunity of making a direct attack on the sale. TRUSTEES OF THE I. I. FUND - SALE OF SUBMERGED LANDS.
Florida, Office of Attorney General, Tallahassee.
Richard Ervin.
Rep Att'y Gen Fla 059-1, Jan 1, 1959.

Descriptors: Channels, *Bulkhead line, *Spoil banks, Beds, Riparian rights, Legislation, Islands, Access routes, Artificial watercourses, Sand bars, Navigable waters, High water mark, *Tidal waters, *Florida.

The Attorney General gave opinions to two questions. The first question was does a bulkhead line established so that it precludes 'A' from filling adjacent to his upland permit 'B', an adjoining upland owner who is not so precluded, to purchase that part of a spoil bank which extends in front of 'A'S' upland. This question was answered in the negative. The bulkhead act gives only the upland owner a preference to purchase the submerged land riparian to his upland, i e, that lying between his upland and the channel. Adjoining upland owners have no more preference than the general public to purchase this land. The second question was may a spoil bank, separated from the mainland by an artificial channel, be sold at competitive bids rather than to the upland owner. The Attorney General answered in the affirmative, stating that when an artificial channel has existed for a number of years, it established the limits of riparian rights. Thus the trustees of the internal improvement fund may sell at competitive bids those submerged lands which are separated from the mainland by artificial channels. (R. H. Watson-Fla)

ADOPTION OF CHANGE OF BULKHEAD LINE BY MUNICIPALITY SINCE EFFECTIVE DATE OF SECTION 253, FLA STAT.
Florida, Office of the Attorney General, Tallahassee.
Richard Ervin.
Rep Att'y Gen Fla 059-176, Sept 3, 1959.

Descriptors: Legislation, *Bulkhead line, *Cities, *Riparian rights, *Florida.
Identifiers: Charter, County commissioners.

The question asked of the Attorney General was, 'May a municipality, under charter provisions in force and effect when sec 253.122, F S, was enacted, adopt or charge a bulkhead line without complying with said section.' The Attorney General's opinion was that the above question should be answered in the negative, unless the municipality had been relieved from complying with sec 253.122, by legislation adopted subsequent to June 11, 1957. PETITION OF SUFFOLK COUNTY WATER AUTHORITY (POWER OF THE WATER POWER AND CONTROL COMMISSION).

12 App Div 2d 198, 209 NYS 2d 978-982 (1961).

Descriptors: Judicial decisions, *New York, *Water supply, *Administrative decisions, *Administrative agencies, Water districts, Public utilities districts, Competition, Regulation, Relative rights, Public utilities, Cities.

Two public water supply agencies sought future service of the same territory. The legal right of the Water Power and Control Commission to rearrange its formal approval and authorization to provide water service given to petitioner Suffolk County Water Authority was challenged. Petitioner had notice of an intention by the Town of Huntington to service an area within the town which petitioner sought to serve, and clear objection by the town to petitioner's application to serve this area. Added to this was an explicit reservation by the Commission in its approval of petitioner's application to the effect that the Commission might exercise adversely to petitioner a 'right to alter the boundaries of the area' and to grant 'other' authorizations in the same territory. These reservations referred to the activities of the Town of Huntington noted in the same proceedings in which petitioner obtained its authorization. This was followed shortly by the town's action seeking legal status to extend the territory of its water district. The court held that petitioner had not demonstrated that the Commission's decision was unjust, inequitable, arbitrary, or capricious, and confirmed the determination. (Smodish-Fla)

GELLENTHIN V J AND D INC (DAMAGES FROM WATER RUNOFF).
71 N J Super 226; 176 A 2d 515-520 (1961).

Descriptors: *Runoff, *Reasonable use, *Alteration of flow, Repulsion (Legal aspects), Drainage water, *Surface runoff, Easement, Legal aspects.

The plaintiff was injured while walking on a public sidewalk when he slipped on ice that had been formed from water running off the defendants property. The court held that the 'reasonable use' doctrine was applicable. Each possessor is legally privileged to make a reasonable use of his land, even though the flows of surface waters is altered thereby and causes some harm to others, but incurs liability when this harmful interference with the flow of surface waters is unreasonable. The issue of reasonableness is a question of fact to be determined in each case upon a consideration of all relevant circumstances. The court affirmed the judgment for the defendant. (Horner-Fla)

PEOPLE V BROEDELL (OWNERSHIP OF LAND).
365 Mich 201, 112 N W 2d 517-520 (1961).

Descriptors: *Ownership of beds, *Submerged Lands Act, *Beds, Low water mark, High water mark, Boundaries (Property), Water level fluctuations, Real property, Patents, Riparian rights, Riparian lands, Legal aspects.

The case involved a dispute over the ownership of two lots on Lake St Clair. The State claimed that the lots, which had been filled in by the defendant, were submerged lands in 1837 when Michigan was admitted to the Union and thereupon became the property of the state through the Submerged Land Acts. The court said that the decision was not controlled by the high water mark or the low water mark theory or by the philosophy of a movable freehold. It held that if the lots were within the boundary of a land patent from the U S to the defendants predecessor in title, dated 1811, no title passed from the U S to the State of Michigan upon its admission to the Union in 1837, even if the lands were submerged at that time, because it then no longer belonged to the United States but to the successors of the original grantee. The court remanded the case for the trial court to make a finding on the question whether the lots were within the description of the patent. (Horner-Fla)

TONKINS V MONARCH BLDG MATERIAL CORP (NAVIGABILITY OF A STREAM).
347 S W 2d 152-158 (Mo 1961).

Descriptors: *Missouri, Judicial decisions, Damages, *Streams, Streambeds, Ownership of beds, *Navigable waters, Non-navigable waters, Riparian rights, Boundary disputes, Boundaries (Property).

Plaintiff alleged that defendant corporation had wrongfully removed sand from the portion of a river bed lying between plaintiff's bank and the thread of the stream. Plaintiff contended that the river was non-navigable where it passed his property, and therefore he owned the river bed as well as the bank at that point. The defendant denied that (1) the river was non-navigable; and (2) it had removed sand and gravel on the plaintiff's side of the thread of the stream. This court affirmed the verdict for defendant. Since the plaintiff alleged that the river was non-navigable, it was his burden to prove it. Each determination as to navigability must rest on the facts of the particular case. A stream need not be navigable in its entirety to be classified as navigable. Navigability must be determined by the capability for use by the public for transportation and commerce, rather than the particular extent and manner of that use. (Blunt-Fla)

BERNARD V STATE (SUIT TO RECOVER VALUE OF LAND TAKEN FOR PUBLIC PURPOSE).
127 So 2d 774-781 (Ct App La 1961).

Descriptors: *Drainage, *Ditches, *Eminent domain, Damages, Appropriation, Canal construction, State governments, Excavation, *Louisiana, Judicial decisions, Condemnation, Compensation.
Identifiers: Public purpose, Servitude, Police power.

Court of Appeals affirmed the trial court's award of damages for the taking of a portion of plaintiff's land for a drainage ditch. The ditch was along the edge of plaintiff's land bor0ering a public road. Damages were awarded for the value of the land appropriated, cost of constructing a bridge to the road, and decrease in the value of the property. Although the state cannot be sued without the consent of the legislature, if it appropriates land by eminent domain it must pay just value of the land. The appropriation of plaintiff's property for the drainage ditch did not constitute the exercise of the state's police power entitling the state to take such property without compensating the owner. The state was not entitled to be decreed the owner of the property used, but was entitled only to a servitude for drainage purposes over that portion of the property affected by the actual excavation. (H. Watson-Fla)

MCKNIGHT V BROEDELL (TITLE TO RIPARIAN LAND).

212 F Supp 45-53 (D C Mich 1962).

Descriptors: *Ownership of beds, *High-water mark, Boundaries (Property), Real property, Federal government, State governments, Navigable waters, Water law, Legal aspects, Grants.

As a defense to an action for payment on a contract to purchase riparian land, the defendant claimed the title was unmarketable because the State claims ownership of a portion of the land. The land in question borders Lake St. Clair and part of the land is within the ordinary high water mark of the lake, having been filled in subsequent to 1923 thereby converting it into land suitable for building purposes. The question is whether the original grant from the U S to one Abbot in 1810 included the land claimed by the state or whether the grant to Abbot only included land to the ordinary high water mark of the lake. If the latter, then the title to the bed of the lake below the high water mark went to the State upon its admission to the Union. The court held that it was a factual question whether the lake had risen and covered the land in question since 1810 or the original surveyor had erred. Since a purchaser is not required to buy land which he might later have to defend title to, the title was unmarketable. (Horner-Fla)

JONES V HOGUE (APPORTIONMENT OF ACCRETION).
129 So 2d 194-203 (La 1960).

Descriptors: *Accretion (Legal aspects), *Boundaries (Property), Real property, Riparian land, Riparian rights, Water law, Legal aspects, Ownership of beds, Navigable water, Boundary disputes, *Louisiana.

The court was asked to apportion an alluvial formation that had formed in front of the riparian property of the parties. When alluvion formed in front of the estates of riparian owners is to be divided, two objects are to be attained: (1) each owner should receive a fair proportion of the area; and (2) each should receive a fair proportion of the new frontage on the water. The court must take each case as presented and order an apportionment by the method which will most nearly attain the two objects and do justice to the parties. In this case, there was no showing that river frontage had any importance for commerce or navigation, so the court used an area method of apportionment. The alluvion was divided to give each party that portion of the entire area (as it existed at the time the action was instituted) as the length of the original front line of their property bears to the length of all the property to which the alluvion was attached. AN ACT PROVIDING A PENALTY FOR WELL DRILLERS WHO FAIL TO SUBMIT A REPORT TO THE WATER RESOURCES COMMISSION UPON COMPLETION OF EACH WELL.
Connecticut Public Act No 735 (1967).

Descriptors: *Connecticut, *Well regulations, Well permits, *Water wells, Wells, Drilling, Water law, Legal aspects, Legislation, State governments, Administrative agencies, Subsurface waters, Public health.

Section 25-9 of the 1965 supplement requiring registration of well diggers, the acquisition of permits, and the submission of a report when a well is completed is expanded. The addition provides that if the Water Resources Commission ascertains that a report has not been submitted within sixty days after the completion of a well, the Commission shall notify the driller that he must forfeit $25. AN ACT TO AMEND 29.05 (1) AND TO CREATE 30.125 OF THE STATUTES, RELATING TO CUTTING WEEDS IN NAVIGABLE WATERS AND PROVIDING A PENALTY.
Wisconsin Laws of 1967, Ch 185.

Descriptors: Legislation, *Wisconsin, *Weeds, *Navigable waters, Lakes, Lake shores, *Remedies, Floating, State jurisdiction, State governments, Administrative agencies.

The State of Wisconsin has made it a nuisance to cut and fail to remove weeds from navigable waters. Violators may be penalized by fine, imprisonment or both. This shall not apply, however, where lake property owners, incorporated under specified statutes, decide at an annual meeting that every such property owner shall remove weeds floating to his respective shore. The State Conservation Commission and its deputies are authorized to enforce this law. (Geraghty-Fla)

WICKOUSKI V SWIFT (USE OF POND SURFACE).
203 Va 467; 124 S E 2d 892-895 (1962).

Descriptors: *Ownership of beds, *Riparian lands, *Riparian rights, Beds, Ponds, Lakes, Surface waters, Boundaries (Property), Dams, Water utilization.

The complainant sought to enjoin the defendants from using the surface of his portion of a fresh water lake. The question was whether the complainant had exclusive control and use over his portion of the bed of the pond and had a right to erect a fence on his boundary line across the pond. The court distinguished between a situation where the riparian owner's property was bounded by a pond and one where each owner owned a part of the submerged land beneath the pond. In the former situation, each owner has title to the bed to the middle of the pond and each owner may use all of the surface water. In the latter situation, as in the case at hand, the owner of a portion of the bed with distinguishable boundaries is entitled to exclusive control and use of the waters above his portion and has the right to erect a fence. (Horner-Fla)

TRUSTEES OF GREEN BAY LEVEE AND DRAINAGE DISTRICT NO 2, LEE COUNTY V ALEXANDER (REASSESSMENT OF DRAINAGE DISTRICT).
108 N W 2d 593-601 (Iowa 1961).

Descriptors: *Iowa, Civil law, *Drainage districts, Judicial decisions, Leases, Contracts, *Assessments, Levees, Ditches, Drains, Taxes.

When the drainage district was being established, the defendants' predecessors in title filed remonstrances against the establishment of the district, basically on the ground that their lands would not be benefited by the creation of the district. In consideration of their concessions, the contract establishing the mutual district provided that the defendants' predecessors in title were to be assessed only for levees, ditches and drains wholly on their lands and an additional five cents per acre annually for maintenance after completion of construction. Forty-two years later, the trustees of the district passed a resolution requiring reclassification of all land subject to assessment in the district. The trustees, plaintiffs here, petitioned the court for a declaratory judgment permitting them to reclassify the land in excess of five cents per acre annually, according to benefits received. The court denied the petition and held that the contract of predecessors of title of both plaintiffs and defendants was binding on them, and the fact that some of the land has been subsequently transferred by means of a tax title was not a change in circumstances that would free the trustees of the district from prior restrictions or covenants. The establishment of a mutual drainage district by contract did not violate a prohibition against any lease or grant of agricultural land for over twenty years. (S. Scott-Fla)

DRAINAGE COMMISSIONERS OF HAMMOND MUTUAL DRAINAGE DISTRICT V PONDER (ANNEXATION BY DRAINAGE DISTRICT).
20 Ill 2d 351, 169 NE 2d 784-787 (1960).

Descriptors: Administrative decisions, *Illinois, Civil law, *Drainage districts, Judicial decisions, Drainage programs, *Assessments, Tile drainage, Ditches, Drainage engineering.
Identifiers: Farm Drainage Act.

The drainage commissioners of a mutual drainage district passed a resolution charging landowners within the district with an additional assessment for repairs, maintenance and operation of the drainage system. The appellant objected to the assessment against her property, claiming that her property did not drain into the ditches of the district, and that neither she nor her predecessors in title had agreed to include the land in the drainage district. The court found that improvements on the appellant's property drained naturally and by tiles into the district drains. The construction and connection of drains from appellant's land into the district drains and the resulting benefit to the land effectively annexed it to the district. It is lawful for the commissioners of a drainage district to require additional assessments to repair, maintain, operate or improve the drains and other works of the district without prior authorization of the court, provided it does not involve a substantial or material enlargement or alteration of the system. (S. Scott-Fla)

BOROUGH OF ISLAND HEIGHTS V PRESBYTERIAN CAMPS AND CONFERENCES, INC (ASSESSMENT OF SUBMERGED LANDS).

68 NJ Super 291, 172 A 2d 228-231 (1961).

Descriptors: *New Jersey, Civil law, Judicial decisions, Beds, Riparian land, *Riparian waters, Landfills, Reclamation, Riparian rights, Beds under water, *Ownership of beds, *Assessments, Taxes.

Respondent owns upland, tax-exempt property. Adjacent to this upland property respondent holds underwater property under a grant from the State of New Jersey, with the right to fill in such underwater land and retain it for its exclusive private use. The Borough of Island Heights separately assessed the riparian rights for taxation. The court affirmed this assessment on the ground that the respondent had legal title to the lands under a riparian deed from the state. Respondent's ownership was not limited to a right to reclaim and fill in such lands that would not ripen into ownership until the right was exercised, but rather was in the nature of a fee, with no ownership remaining in the state. (S. Scott-Fla)
